I'll Set You Up in the Oil Business Without A Penny Investment

Yes, Sir! If you have the ambition to work—where work means big money, I'll start you in the oil business with me without a cent of investment. I want ambitious, trustworthy, energetic men—men I can depend upon—in every county to take orders and look after my business. The man I select for your territory I'll make my partner, furnish everything that's needed to do business and **divide the profits \$50.50 every week**. I have hundreds of men established now on this basis. Am ready to put on 100 more. It's a chance of a lifetime—a real opportunity to win unlimited success.

\$50 to \$100 A WEEK
Your Share Of The Profits
On this square plan, Wengard, an Ohio partner, made \$430.00 for his share in one week. Montgomery, in Iowa, made \$210.00 for the first week he started. In West Va., Mason's share for a week was \$126.02. Hundreds are making big money every month the year round. No wonder my representatives are enthusiastic. No wonder my men call this "the prize opportunity of the age."

Everybody Buys Oil
It's a great business—something doing every minute. Millions of automobiles, trucks, tractors, farm engines use oil. You know that. The market is unlimited. In this proposition you handle the nationally known line of Cen-Pet-Co Motor Oil—oil of wonderful quality—15 years a leader in the field of motor lubrication. Prices are right. Beats all competition. You simply take orders on long credit terms. No ship direct from refinery warehouse and collect. **Pay you every week.** Every order means a satisfied customer. You soon have large, steady order business of your own.

PROFITS GROW FAST
In addition to lubricating oils, I give you the opportunity for greater profits with my complete line of Columbia Paints and Roofing—well known brands in constant demand. There's a big business waiting for you wherever you are. No matter what you are doing now or what kind of work you've done, young or old you are. If you are willing to work, follow my directions and have the ambition to make real money, I can guarantee your success.

Write Quick Don't wait if you want this chance. Opportunity must be complete at once. If at the start you can devote only your spare time to this business, I can arrange that. I'll have an interested in your proposition. In a letter or on a postcard. Tell me and I'll send you a valuable proposition about \$100.00. All it will cost you is a stamp. You can be doing business and making money without a penny more capital. First applications get the preference.

P. T. Webster, General Manager
Central Petroleum Co., CLEVELAND, OHIO

HUNTING & FISHING

Is a 50-piece monthly magazine of game and fishing. Contains all the latest news, fishing, trapping and sports stories and illustrations. It is a valuable reference about the sports of the outdoors. This is a new feature. Best prices for fish and game, etc.

264 Transit Bldg., Boston, Mass.

FREE TO FARMERS

The Cutaway Harrow Company, Bloomington, Conn., are sending free to farmers throughout the U.S. "The Soil and Its Tillage" and the "Cutaway" Catalog of disk harrows and plows. The first book contains much valuable information about modern farming methods. It tells how to use the harrow and better crops with less time, labor and money. The "Cutaway" Catalog describes the Harrow Cultivator and One Horse Harrow by the Harrow Cultivator. It is about several hundred pages long and contains many illustrations. The catalog also explains who disk with other FARMER. Send for these two books today. A postal will be addressed THE CUTAWAY HARROW COMPANY, 27 Main Street, Bloomington, Conn.

PLEASE mention Pennsylvania Farmer when writing to our advertisers. They want to know and we want them to know that you read it all.

Farm Facts and Fancies

By ALVA AGEE

CAN millions of us be educated to keep the production of food within profitable bounds? When I read the report of the chief of the U. S. Bureau of Agricultural Economics I feel that it is on the right track, but that track has no particular value to us unless we travel in it. A great industrial trust, like General Motors or United States Steel, has shrewd economists to guide it in respect to expansion. The farmers have the same shrewd service in the analysis of food production activity.

I have found the report heartening. Within my limited judgment there is evidence that the Bureau is going at its problem of determining the situation of production and marketing just as a big industrial trust would do. The government is doing for millions of independent, scattered farmers what a billion dollar trust can do for itself. We know where the farm stuff is coming from, what expansion is possible in each area and each line of production, and what are probable needs of this country and other ones.

I repeat that to a plain layman the activities of this national Bureau makes a strong appeal. The plans are comprehensive, and strike a man as practical.

What Advantage?

How much good can come from all this data and analysis so long as each individual is in the farming game for himself, and that is the way we want him to continue to be in. A trust can cut down on one line of production, shut down a plant when in its interest and meet needs as it foresees them. It uses the data of its economists. A loss at one point means a bigger gain at another. That isn't so in farming. If one farm cuts down operations, no other farm makes a contribution. The government may give us a true picture of farm production facilities and market demand, but millions of independent individuals, each one for himself, must go it alone, and take the chances.

Here Is the Trouble

The idealist may say what should be, but a farmer's interest for the coming year may run counter to the general interest. If the growers of a certain commodity are told by the economists that planting should be restricted, and it is restricted, the individual farmer reasons that the year may be the one to pay off some of his debt if he plants more than usual, while others are planting less.

You criticize him? Well, you have ground for that, but it is his debt and his farm and he is an individualist. Let's put the case more generously. He isn't sure about anything except that if he does not have stuff to sell the sheriff may do the selling, and there is the land, the teams and his will to work hard, and he drives ahead and lets theories and predictions go hang.

A farmer's immediate interest, and maybe long-time interest, isn't necessarily the same as the welfare of the crowd. He may push the farm to capacity to save himself when the general welfare might demand a ten per cent cut in acreage.

Spurring Production

Julius Barnes is President Hoover's chairman of the committee to get team-work out of all industries so that this Wall Street panic will not cause an industrial slump. He has pointed out to Chairman Legge, of the Federal Farm Board, that the loaning of money at a low rate to keep wheat off the market at this time in expectation of higher prices later on will encourage growers to increase acreage.

I am glad there are funds provided to hold the wheat if prices are to be higher, and all of us want the growers to be the ones who profit if there is

a real world shortage of wheat, as some good authorities believe, but Mr. Barnes states a disconcerting truth when he says that higher prices increase acreage, and there is danger in that. We know that an industrial trust would profit by any temporary scarcity but would not be led into doing what wheat growers will be doing.

Price is the regulator of production, and when it is good we pay no attention at all to data and analyses provided by our trained economists, but increase acreage. It is discouraging, and I doubt the statement of the man who shuts one eye like an owl and claims he sees clear through the matter.

Censure and Approval

Why are we not as quick to praise a public servant when he does what we regard as a right thing as we are to censure when he fails to do it? I am thinking of the round of applause due Chairman Legge and his board from price-control adherents when he announced loans on stored wheat nearly up to market value. The applause couldn't come from those who believe the action was unwise, but a great mass of farmers believe the Board should help keep wheat off the market, and Mr. Legge should be heartened by evidence of approval.

He has taken a sizable risk—a risk to himself, I mean—because if matters do not turn out well he will come in for a lot of criticism. All hinges on the demand Europe will make on the present stored supply in Canada and this country. Canada decided this year to hold wheat back and so has this country. Europe is content to use the supplies of the southern hemisphere and do no bidding up on price until necessity appears.

If the European importers are guessing wrong and we are guessing right, the Board's action will aid in putting scores of millions of dollars into American pockets. If we are wrong in our estimate of the amount of wheat Europe must have this season from America, there will be a different story.

Using the Board's Power

Personally, I am glad we are trying out this new power the Farm Board has been given. It looks like the year when there is more than usual chance of success in attempted price control. On the other hand, I carry in mind the fact that many of the keenest capitalists in the world buy and sell wheat in accordance with their judgment regarding supply and demand. Each one backs his own judgment with his cash, and all he tries to do is to guess right about future prices so that he can add to his fortune.

The market price today represents the summing up of their opinions. If more thought future prices would be higher, the price would go up at once because they would be wanting to buy more heavily than others wanted to sell. It would be the other way round if sentiment favored selling. Regardless of such expression, the Board says wheat will be higher, and it takes the risk of pretty general criticism if its judgment proves to be at fault.

Why should there not be as hearty praise right now from those who want price control attempted as there will be criticism if our surplus finally fails to move and chokes the market next year?

LAND which is not valuable for the planting of crops or for dairy purposes at state institutions under the supervision of the Pennsylvania Department of Welfare is being turned to profitable timber land by the planting of hundreds of thousands of forest tree seedlings, according to a report made public by Mrs. E. S. H. McCauley, State Secretary of Welfare.

Every Home Without Electricity
Made a

BRIGHTER-BETTER PLACE TO LIVE WITH THIS NEW INSTANT LIGHT Aladdin

Kerosene Mantle Lamp

million people
Note the many

Here's good news for all homes that use kerosene for lighting. This new Aladdin makes it possible for them to have light of even better quality than electric and at less cost. It is also over four times as efficient as the best open flame lamp—saving its cost in a few months. This Modern White Light of a quality next to sunlight from kerosene is a modern miracle. Homes are dark and dingy now made bright and cheerful. Over seven million people enjoy its comforts. Note the many desirable features.

FEATURES

Burns common kerosene (coal-oil). Lights instantly. Gives a modern white light equal to 10 ordinary lamps. Absolutely safe. Burns 94% air. The most economical of all lights. No odor, smoke, noise or trouble. No generating or venting. A match and a minute that's all. All styles; table, hanging, bracket and floor lamps in nickel and bronze. Endorsed by world's highest authorities.

FARQUHAR POWER

You can depend upon steam to furnish abundant power under all conditions. Farquhar's 4500 Center Trunk Engine has been built for many years and with its modern improvements is the best economical and dependable today. Engine may be detached and mounted on concrete base or mounted on Flat Steel Scaffolds which are riveted to and make a permanent part of the boiler—various types of boilers for this engine. We also build Dairy and Vertical Boilers designed for the individual Dairy, Milk Plant, Creamery, etc.

The Farquhar-Herules power unit uses coal, oil or kerosene, is mounted on strong truck and is admirably suited for driving sawmills or other machinery.

If you need a dependable engine, boiler, or complete rig, write for Bulletin 425.

A. B. FARQUHAR CO., Limited

Write us for samples and prices.

THEO. SUTY & SONS Box 55, Milrose, Ohio

Heedless Jason Tarbell

By FRANK K. RICH

CALEB PEASLEE, on his way home from the village store, had paused at Deacon Hyne's gate for a chat. As he placed the bundles which had burdened his arms in a row on the bench he seemed to miss something. He made a careful count and his face fell.

"I'm gittin' careless," he said regretfully. "While that red calico wa'n't the only thing my wife wanted me to git, you'd think it was if I sh'd go home without it. But I'm goin' to rest my laigs a minute first," he said, and sank upon the bench accordingly. "She tole me only yest'day," he went on, "that I was near as heedless as Jason Tarbell ever was, and I con- 'dricted her with some heat, I guess. But if I got home 'thout that calico she'll only say it all over again and this time I won't be able to say a word to her!"

"What about Jason?" the deacon asked.

"A lot of things about him," Caleb returned. "He was about the most thoughtless and heedless man that ever lived 'round here—he was a kind of by-word for it. But the thing she had in mind was one time he nailed up his barn so to keep a sheep out of his seed corn; I know by the way she talked that she was 'ludin' to that."

"What did she say?" the deacon inquired. Caleb laughed a little.

"She said," he acknowledged, "that if she caught me with a hammer and nails she'd feel it her duty to go count up the sheep, to be sure they was all at large; she said I was 'nough like Jason to make her want to take that precaution, for humane reasons."

Strange Doings

"Well,"—the deacon began. "Well," Caleb went on, "what she meant was one time I happened to go over to Jason's one morning early and found him goin' out to'rds the barn with a hammer in one hand and a box of good-sized nails in the other; so I travelled along with him, thinkin' to 'd'scharge my errand with him, whatever it was, and go off home about my business again.

"When we fetched up in front of the barn I was sort of 'sprised to see Jason sort over the nails and pick out ten or a dozen of the biggest of 'em and start to drive them right through the aidge of the door into the jamb of the doorway."

"What in tunket?"—I says; but he was makin' such a racket with the hammer I waited 'till he was through; and then he answered me, even if I hadn't finished the question.

"I'm f'gitful, and nobody knows it better'n I do myself," he says, 'and I've got my seed corn in there on the barn floor, all traced up pretty to carry to the fair next week; and after I show it there I'm plannin' to lug it off into the shed chamber where it'll

dry and be ready for seed another spring, if I'm spared to plant it."

Safety First

"Well,"—I says again, but he took the question out of my mouth again. "I've got one sheep," he says, "that's been p'sseded to git in where that corn is ever since I laid it out there. She goes in every time I leave the door open and I'm so f'gitful I don't always think to close it behind me. And for the reason that I'm goin' away all day, me and my wife both, over to the Parlin reunion, I'm goin' to fix this door so I won't be likely to go off and leave it open—and nobody else'll be able to open it whilst I'm gone. I figger, for once," he says, "that I've fixed things so's my f'gitfulness won't be a hurt to me!" And with that he took his hammer and nails back to the woodhouse again.

"Well," Caleb went on, "Jason and his wife went off to the reunion, same's they planned, and was gone all day; and I didn't give him another thought, more'n to think it must be unhandy to have to guard against a bad mem'ry the way he had to.

"Come evening, though, Jason come over to my place and asked me if I'd seen his black-faced sheep anywhere 'round durin' the day.

"She always comes up at night, when the rest of 'em do," he says, 'but tonight she didn't—so I'm a mite worried.' I tole him I hadn't seen her but I went along back to help him look for her.

"When did you see her last?" I wanted to know, and he said no longer back than that very mornin'." "She was here with the rest of 'em when I went to git the nails and hammer," he says.

Wasted Effort

"Just as we stood there wonderin' where it'd be best to look for her, we saw old lady Drake comin' 'cross the road. You know she used to live right opp'site Jason's, but, spendin' most of her time in the kitchen, away from the road, she hadn't seen us huntin' at first.

"Oh, Jason," she pipes up, 'there's a sheep in your barn that's been makin' an awful to-do part of the time today. I tried to open the door to see if it was hurt, or anything; but the door was nailed up so'st I couldn't budge it. I hope there ain't nothin' wrong with the animal,' she says.

"I took one look at Jason," Caleb said, "and then I says, 'I guess I might's well be gittin' along home.' I says, 'And Jason looked up, and says he, 'Yes—and I guess I might's well give up any idea of showin' that seed-corn at the fair!' Nail up that door," he says, bitter-like at himself, 'to keep a sheep out—and be heedless 'nough to nail the sheep in there! I'm goin' to quit tryin' to be careful from now on," says he—'sif he meant it!"

Does that feeding problem bother you?

Please let us know—perhaps we can help

How would you like to have a group of men working for you... solving your feeding problems... collecting information from authorities all over the world... all with the one idea of making your business more profitable?

Certainly you would like it... but to hire them yourself would cost you many thousands of dollars a year. Instead, you can have the benefit of their advice applied to your own specific problems... and it will cost you exactly nothing.

They are the men who compose the Park and Pollard Service Department. They know both the scientific and practical sides of live stock and poultry feeding. With all the information at their command, they are able to solve any problem you may have.

Moreover, they can give helpful advice on questions relating to breeding, management and other subjects. Their training has equipped them to do so. As they keep constantly in touch with the latest developments in all phases of poultry keeping, dairying and live stock management, their counsel is both up-to-date and sound.

The maintenance of this department is one of the many ways in which The Park and Pollard Company helps the feeder to attain maximum profits.

Further manifestations of this helpful spirit are the research laboratories and experimental farms that continually test new ideas in feeds and feeding.

We find that helping others pays—it makes prosperous, happy customers who help us to be prosperous, too.

To be sure of profit-making feeds—

NESHAMINY GARDENS

By R. P. KESTER

LAST week I started to explain to my politically-minded friend what a sure-enough, country log-rolling was like. I used up my space in telling about the burning of a "clearing," after which comes the log-rolling frolic.

After the "clearing" was burned, and a considerable amount of work had been done in piling and burning brush which had escaped the big fire, the next job was to roll the logs into heaps for burning. And logs is the right term. I have seen better lumber put into log heaps than much that now goes to saw mills. The "down" trees—trees which had fallen in past years, but in which there was some good lumber, much of it the best of pine—were sawed into log lengths ready to pile.

Of course, not every farmer made a "frolic" to get the logs piled, but it was done frequently, especially if the clearing contained five to ten acres. Men were "invited" by personal invitation. Usually, four teams and four crews made up a rolling bee, each team requiring three men besides the driver. The wives of the married men were invited to help the "women folks" prepare the meals, and maybe make a quilt. Strange as it may seem, there were mostly more people attended a rolling frolic than were actually needed. Some would come without an invitation, showing something of the old-time eagerness of the people to get together, and also their willingness to help a neighbor.

The men and teams arrived around seven o'clock in the morning; a man would have felt guilty in coming any later. A captain was appointed to head each crew, and they chose the members of their crews much as boys choose up to play ball. Then the courses across the clearing were staked off, the stakes having been prepared by the farmer previously. A course extended from one side of the burned track to the opposite side, and was as wide as it was convenient to haul.

One of the men acted as chain man, that is, he followed the team and hitched to the logs and unhitched when they were drawn to the pile. The other men, armed with canthooks and "hand-spikes" rolled the logs up onto the piles on skids. The piles were made as high as it was practical to roll up the logs. The small stuff—limbs, trash, etc., was placed in the crevices and on top of the log heap.

Very often contests were waged between the crews to see who would finish their course across the clearing first. These were waged with the vim and effort one sees in a game of baseball or football. Men worked at top speed, and woe be it to the one who was caught shirking. It is surprising how much hard labor was accomplished at a frolic of this kind, and all done in the best of humor and good cheer.

And such meals, and such appetites! After an hour spent at eating, the crews went to work again and worked till quitting time, or until the job was done. In most instances there was a party at night, sometimes a play-party, but more often a dance depending, of course, on who was giving it. Be it remembered that in the olden days there were two kinds of homes—those in which dances might be held, and those where "the old folks" did not permit it. But there was no hard feelings about it. Everybody knew beforehand which way it was, and each respected the customs of the homes.

I never attended a rolling frolic at which liquor was used, although it

was done in some instances. I have heard my father say that it was an invariable custom in his boyhood. Any man who did not provide drinks would have been out of luck had he tried to have a rolling bee. But mother always made up a drink composed of a slightly sweetened water, to which a little vinegar and a pinch of ginger were added. This was thought to be good to "cut" the black dust from the men's throats.

A log-rolling was perhaps the hardest and dirtiest among the many kinds of country "frolics." Others, such as corn-huskings, barn-raising, apple-parings, etc., were more popular but not better attended. These things were a part of pioneer life, and were necessary to furnish occasions for social mingling. In other words, the people needed excuses to come together, and it was not popular to take time off and "waste" it by doing nothing. So they made their work an occasion and an excuse.

I am well aware that this recital is far afield from my task of writing of our doings at Neshaminy gardens. Yet, I am not sure but what it is a good thing to revert to the past now and then, and compare life today with that of our fathers and mothers. My life is a sort of connecting link between the time which was almost primitive in my neighborhood, and these days—the best days humanity has ever seen.

Friendly Talks By Edgar L. Vincent

I KNOW a little black and white dog that sits out by the side of the road every school-day afternoon, waiting for a boy. When that lad wheels around the bend of the road, away bounds Plato to meet his young master, with every sign of love in yelp and bound. If there ever were two pals, this boy and his dog are pals.

A horse I used to know had that same faithful spirit. His master was a country doctor. Not a night so dark, not a storm so severe that Billy did not bring his master home through shadows all safe and sound. One night on a slippery road the doctor's "gig" began to slip on a steep hill road. The doctor did not know where he was going to land, but that something was going to happen he was sure. When the two-wheeled rig came to a standstill, the doctor got out and found that horse, rig and all were headed back up the hill, and there stood Billy, bracing himself to keep from being carried away down the awful road. The old true-hearted friend had saved the doctor's life once more.

One of the queerest things in the world is the way we sometimes treat these friends of the faithful heart. First and last they come in for a great deal of misuse; and it is not right. Nothing proves more clearly what sort of a heart a man has than the way he cares for and uses his horses, cows, dogs and cats. And let me tell you this: I believe every blow we put on one of these creatures the worse men we are inside of us. It never makes a man better to get mad and tear around at any living being.

But it pays well to be kind, kind to men folks, kind to boys and girls and kind to all the creatures God has made and given us for our best good. Kindness lifts you and me up a little bit toward the best there is "Be ye also kind."

Burpee's Seeds Grow

The Vegetables and Flowers you would like to grow in your garden or on your farm—read all about them in Burpee's Annual Garden Book. This is the catalog that tells the plain truth about the best seeds that grow. It describes the Burpee Quality Seeds, Bulbs, and Plants. Write for a free copy of Burpee's Annual.

THE BOARD AND THE LAW

IN all our discussion of the great marketing experiment now under way let us remember that the Federal Farm Board is merely the agency by which the Farm Marketing Act is administered. The Board is not responsible for the law or the fundamental defects thereof and does not deserve criticism for what it does according to the provisions of the law. Yet the Board has been denounced, and will be, for doing precisely what it must do if it observes the letter and the spirit of the law. We have freely criticized the law and pointed out its fallacies, but such comment does not imply and should not be taken as criticism of the Board.

INTEREST RATES

LAST week we referred to the interest rates to be charged borrowers of the revolving fund administered by the Federal Farm Board. In reply to inquiries which we passed along to the Board it says what we have already stated as to the terms on which the cooperative association may borrow. As to what rate of interest the individual borrower must pay the Board says: "The rate charged by the association to its members is a matter for them jointly to determine, and in most cases is sufficiently higher than that paid by the association to take care of expenses in connection with the administration of the loan and to build up a reserve to take care of losses that may be incurred in some instances." So the associations fix the rate, each association for and by its own members, and the Federal Farm Board has nothing to do with it. The wisdom of such a policy may be determined only by experience.

A STARTING POINT

THE Interstate Commerce Commission has laid before the public its plan to unite in nineteen major transportation systems the many railroads now operating in this country. The chief immediate advantage of this action is that it gives the public something definite to consider. It is only the first of many steps that must be taken toward the goal of better railroad service for the whole country. In this region one of the problems ahead is whether four or five great systems are best, and if five how the fifth can be established when so much of it is now owned by other members of the group. The purpose of the proposed consolidations is sound, from the standpoint of service to the public; for its purpose is to extend all regions the service of competent transportation companies and to give to all regions the terminal facilities and advantages now available to only a part of them. The new plan is certain to arouse much opposition. Any plan would, for no

movement of such magnitude is likely to be satisfactory to all or even to be correct in all particulars at the start. But it does give us a starting-point, a basis for discussion, and probably it would be a mistake to regard it as much more than that at present.

THE OPEN MARKET

ACCORDING to the President of the New Orleans Cotton Exchange 160 measures affecting trading in cotton have been introduced in Congress. They range from provisions for further regulation of exchange trading to total abolition of it, and all of them "exercise a detrimental influence on the market." We have no financial interest in cotton nor have our readers, but we should all have sufficient interest in marketing to understand that the lack of trading in any commodity is worse for the producer than any amount of speculation could be. And we should learn, before we are compelled to learn by costly experience, that whatever interferes with the open market or freedom of trading is contrary to the welfare of the producer. The open market is the best commercial friend of the farmer.

AN INTERESTING LETTER

ON another page of this issue Daniel Dean, a leader among potato growers of this country, brings before us the possibility of trading in potato contracts for future delivery and the advantages of such a market. In justice to Mr. Dean it should be said that his letter is not an attempt to discuss the question thoroughly, for it was not intended for publication. But his views are of interest as indicating the tendency of modern marketing, which has in recent years created exchanges that have established future trading in hides, coffee, cocoa, rubber, silk, burlap, butter and eggs. In all cases this trading was provided for the purpose of reducing the uncertainty and risk of those concerned in business. Those interested in these commodities have acted on the principle that speculators might be helpful in assuming risks and business men might be helped by price insurance, so they provided the opportunity for both.

ANOTHER FUTILE WARNING

IN the fall of 1928 the Bureau of Agricultural Economics warned producers against expanding the area of winter wheat. They didn't heed the official warning but sowed many more acres than in 1927. Last September the Bureau issued another statement headed "Farmers warned against seeding too large winter wheat acreages." Now the Bureau reports that farmers have sown more acres than in 1928, the increase amounting to two per cent. The Bureau does not appear to be getting anywhere with its warnings and probably this is as it should be. For the experience of 1929 shows that if farmers had heeded the Bureau's advice they might have lost money and the country might have lost too. The best adjuster of crop areas is not some board or bureau at Washington with ample facilities for propaganda. It is the collective judgment of producers based on their experience. They are not likely to heed anything else—and probably should not.

BUSINESS SHIFTS

THE late W. W. Hunter told us that when he was a big boy he went with his father to consult another man about what trade he should learn. The conclusion of the elders was that people would always need shoes, so he was advised to become a shoemaker. They could not foresee that this country's shoes would be made in factories. An old man told us that he became a millwright as the result of similar counsel, based on the assumption that mills and men to construct

them and keep them in order would always be needed. So they will, but comparatively few since a few large mills have supplanted thousands of small ones. The trade of tanner has disappeared in the same way and for the same reason. We mention these things merely to show that the business changes of which we hear so much are not a recent development. Such changes have been going on right along, in business and in agriculture as well, and some of them are so remote that the present generation has not even heard of them. Change is about the only certainty in this world.

NOT ECONOMY BUT CONTROL

IN a letter to Hon. William Butterworth, President of the Chamber of Commerce of the United States, Alexander Legge, Chairman of the Federal Farm Board, makes a few significant statements which we take as official utterance of the Board. Mr. Legge says:

"Unless we can work out a different system of marketing which goes far beyond the question of saving a fraction of a cent per bushel on grain, a few cents per bale on cotton, or a few cents per head on livestock, as compared to the present system, there would be little hope of progress in the line of putting agriculture on an equality with other industries, for the simple reason that if all of these operating costs were added to the price the farmer gets for his profit it would make but little difference in the return to the grower. On the other hand, if gradual marketing of what the farmer has to sell through a longer period instead of within a few weeks, as is now the prevailing practice, can be brought about, it may be possible to make a material improvement in the returns to the producer. I think you will agree with me that such a change can only be brought about by the producer himself, as the private trader could not hope to have any measurable influence on this phase of the marketing process. To follow it to its logical conclusion this would result in adjusting production to the reasonable consumptive demand or requirements. In other words, as the Agricultural Marketing Act puts it 'control surplus at its source,' and after all, this is the fundamental difference between agriculture and other industries. It is a condition which we can only hope to correct by collective action on the part of the agricultural producers."

The above and other expressions of the Board indicate clearly that control rather than economy is the main object—control of surplus at the source, control of marketing, and any other control possible.

THE DEER PROBLEM

A PRELIMINARY report by the Board of Game Commissioners indicates that during the twelve-day season beginning December 1st 22,394 buck deer and 12 elk were killed in Pennsylvania. During the bear season, which opened November 1st, 408 bears were killed. All this in a state which had so little game twenty years ago that even the sight of a deer was an event worth reporting.

Along with the increase of deer and bear have come several problems and one of them is an agricultural problem. These must all be solved by experience, since there is no other guide. And the experience with an open season for does has been valuable from the standpoint of agriculture. The doe season of 1928 was not an ideal measure but it did a lot of good. So far as we can ascertain deer did less damage to crops last summer than in any recent year. This not because so many were killed during the doe season of 1928 but because the doe became a wild animal again after being hunted one year, and imbued with the fear of man did not venture so often to damage crops. The lesson is clear enough, we think, to serve as a guide for future action. An occasional doe season is essential for the protection of agriculture. And it will result not only in more deer for the hunter but better trophies. Next time a doe season is proposed we hope to see all interests in favor of it, for after the experience of 1928 the next doe season will be somewhat different.

New Jersey Farm Comment

"MORE persons are killed each year by bulls than by wild animals." That sign in a store window caught my eye as I passed along a busy city street one day last week. In this show window reclined a small Holstein bull calf; in another window two monkeys were carefully inspecting each other for fleas.

As I stepped inside I discovered that a small zoo had been brought to the store to attract Christmas shoppers. "Boo-boo, the smallest bull in the world" claimed the same share of attention as the monkeys, the parrots and other birds and animals from the tropics. To many city children "Boo-boo" might have been a ferocious animal from the jungles, but most of us would recognize him as just a wobbly-legged baby calf which might be some farm child's pet.

A wobbly-legged pet—this is true for a while, but later we realize the truth of the first statement that "more persons are killed each year by bulls than by wild animals." Nearly every week Pennsylvania Farmer reports a death or injury as the result of an attack by an angry bull. Trainers of wild animals soon learn the lesson of caution, while farmers still continue to treat treacherous bulls as family pets. And it often results in a death in that family.

A RECENT bulletin "A Study of Spinach Varieties with Special Reference to their Canning Qualities," prepared by H. B. Farley of the Maryland Experiment Station, will be of interest to many truck growers and canners.

Thirteen varieties of spinach were studied and are classified according to appearance, rate of growth, disease resistance and hardiness.

Some interesting facts brought out by Mr. Farley are: The Virginia Savoy variety was found to be not only the most rapid grower and quickest seeder but it gave the best yield in the fall because of its blight resisting qualities. In short, Virginia Savoy was recommended for the fall crop although in the absence of blight, Viroflay, a very fast growing and smooth leaved sort, is more desirable for canning than the Virginia Savoy. Blight does not occur every fall but the growing of the Virginia variety is good insurance against it if it should appear.

When quality, together with yield is considered, Viroflay, Thick Leaved Round, and King of Denmark are recommended for the overwintered and spring crops. In his experiments Mr. Farley found that all of the spinach canned from the overwintered and spring crops possessed good flavor.

MORE Maryland poultrymen are requesting blood testing and certification for their poultry flocks. A report of the Maryland Extension Service shows that while there were only 951 growers in 1928 who offered birds for this work, this year the number more than doubled, 3,250 birds receiving the blood test. Last year 17,000 birds were submitted for certification, of which 12,000 passed the examination, while this past year 15,323 out of the 21,000 birds submitted passed the requirements.

THE acreage of alfalfa grown by New Jersey farmers has increased from 194 acres in 1900 to 21,000 acres during this past year.

The New Jersey Alfalfa Association has been very active in bringing about this change. The association was organized in 1917, and they began the distribution to members of high grade alfalfa seed of known and improved origin. Since that time nearly 20,000 pounds of alfalfa seed have been distributed by them.

AN additional two tons an acre in yield of canhouse tomatoes has been the result of field plantings done in New Jersey in May instead of June. Records taken by the Experiment

Station on 4,710 acres show that plants set in May yielded 7.35 tons to the acre, whereas June set plants averaged only 5.3 tons to the acre.

That farmers are rapidly accepting the recommendations for earlier field plantings is found in the sales record of one large plant grower. In 1928, the season before the campaign for May planting was inaugurated, he sold 12,000,000 plants before June 1st and 8,500,000 after that date. This year farmers showed a decided preference for earlier plants. Nearly 30,000,000 plants were sold before June 1st, while sales after that date dropped to only 4,750,000.

FOUR new strawberry varieties worthy of trial plantings in New Jersey have been pointed out by J. H. Clark, of the Experiment Station. These are the Ridgely, Boquet, Bliss and Blakemore.

The Blakemore, which was originated by the U. S. Department of Agriculture, has been observed only one season in New Jersey but looks very promising. This berry, while best adapted to the canning and preserving trade, is expected to make a desirable early market berry. Its flesh is very firm and the color is attractive.

Boquet and Bliss originated at the New York Experiment Station and like the Ridgely are proving worthy of more trials in New Jersey.

ONE of the surest methods for increasing the profits made from a dairy herd is to use a pure-bred bull, raise the heifers from the best cows and in this way increase the ability of the herd to produce more milk and butterfat, according to J. A. Conover, dairy specialist for the University of Maryland Extension Service, who further declares that a survey made recently of one of Maryland's counties showed that there were only 130 pure-bred bulls in use although six hundred milk shippers were listed in the county.

Mr. Conover declares that herd improvement records show that in herds averaging two hundred pounds of butterfat or less almost any purebred bull will increase production. However, as the production of the herd increases, fewer bulls will be found that will increase production in their daughters over the daughter's dams. Hence not more than forty per cent of the bulls in use in the herds of the herd improvement members have the ability to increase production in their daughters when the daughters come from dams making three hundred and fifty pounds of butterfat.

A dairyman should, therefore, exercise great care in selecting a bull. He should know something about the average production of his herd, the lowest producers and the highest. Having

determined this, he is in much better position to make a wise selection of the bull of the breed that he prefers.

He should select an aged bull, of good type and conformation, whose daughters have made records that are higher than those of the cows in his own herd. He should select a bull whose nearest dams have made high records, or whose sisters have made such records and it would be wise to look into the record of the dam's entire family.

On to the Far South

THE sketch on this page illustrates the route which will be taken by the Pennsylvania Farmer winter vacation tour for farmers. The two main starting points are Philadelphia and Harrisburg. The special cars from these places will meet at Washington, D. C., and from here the whole party will journey together to Jacksonville, Florida, gateway to the far South and beginning of a series of sightseeing trips and other things of interest which will entertain the travelers throughout their stay in Florida and Cuba.

As will be noted by the map the tour goes through the central part of the state and takes in the well-known places on both east and west coast. In former issues we have mentioned some of the things which will be seen, but a clear conception of the delights of Florida in winter can be obtained only by seeing it for oneself. The special reduced rates which we are able to offer make it possible for a large number of farm folks in this territory to see Florida this year for themselves. That they will do this is evident from the number of replies we have received following the announcement of the trip.

Reservations are now coming in fast. We do not want to deny any one who wants to make this trip the privilege of doing so, but the number which can be taken of course has a limit and the reservations are made in the order requests reach us. We therefore suggest that you do not delay any longer, but send in your reservations today, using the coupon at the bottom of this page, which is supplied for your convenience.

We have a number of requests for lower berths, and hope to be able to take care of every one of them. However, our special rate is based on the sale of sections, that is upper and lower berth, so we are unable to promise lower berths before the corresponding uppers are taken. In discussing this matter with railroad representatives we are informed that porters will be on duty at all times, ready with steps to help any one out of an upper, so that as far as convenience and comfort goes the uppers will be as desirable as the lowers. Travelers also know that the upper berth has certain advantages over the lower, such as better ventilation and easier sleeping quality. Two small persons can occupy a lower berth and have the upper vacant for storing their clothes and other belongings, and thus solve the problem for themselves very handsily. Elderly people will of course be given special consideration in assignment of spaces.

Tour Manager,
Pennsylvania Farmer,
7301 Penn Avenue,
Pittsburgh, Penna.

Enclosed find deposit of \$20 per person for reservation on the Florida and Cuba tour. Balance, or \$164.50 per person, will be paid before February 1, 1930. (Remittance should be made by check or money order—not cash).

Name
Address

I shall join the tour at (mark X) Harrisburg () Philadelphia ()

INSTRUCTION in vocational agriculture in the United States can be vitalized by creating interest in the farmstead as a future home. The rural settings of many farm homes lend themselves to beautification and improvement at low cost. Making farm homes more attractive and comfortable is one of the aims of the instruction in vocational agriculture. The Department of Public Instruction is encouraging students of vocational agriculture in Pennsylvania to devote some of their attention to the esthetic side of their farm life. For this reason, prizes in the form of gold, silver and bronze medals are offered to the three boys doing outstanding work in the home improvement contest which has been conducted annually for the past five years.

Charles Ballard, a student in the Troy High School, who won the gold medal for conducting the best home improvement project in the state of Pennsylvania one year, gives his experience and his conception of this work as follows:

"I have always liked carpentry work; so since our home needed some improvements, I chose to carry this type of project. The farm was bought by my great grandfather Hooker, who came here from Connecticut when my grandfather was only eight months old. They first lived in a log cabin just north of where our house stands today. They gradually cleared the land of timber which they sawed in their own mill and built our present home, where grandfather lived till his death at ninety years of age. Because I love our home, I want to learn all I can about agriculture so I can take good care of it and keep making improvements as long as I live.

"What I consider as one of the most important steps in my project was the building of the retaining wall along the road in front of the house and building two sets of steps at the entrance of the house. The lawn has been graded in behind the wall and it is surprising to see what a great difference it makes. The old ice house, which stood at one side of our house and obstructed a beautiful view from our big kitchen window as well as detracting from the general outside appearance, was razed and a new ice house built back out of sight. Another building was moved from beside the old ice house and taken down across the road and converted into a two-car garage.

"The old shop was torn down completely and the cornerb was moved across the road behind the barns. The woodwork inside the main house as well as the outside of some of the other buildings was painted. The shade trees were pruned and the old and diseased ones removed, while special care was taken to clear the trees that were obstructing the wonderful views that are possible from different windows in the house. The barns came in for their share of improvement when the roofs were shingled and the milk house was given new siding and some paint.

"Some of the things that we have yet to do are: finish grading the lawn and build a lattice fence and a gate with an arch over it between the lawn and the garden. Also in the spring we will landscape the grounds, plant a hedge between the lawn and orchard and get our flower garden started. In addition to this, some of the buildings that have been built or moved will have to be painted.

"Home Improvement has not been considered among the project lists until recent years. It has not been taken up extensively yet but it should be carried out to a much greater extent all over the United States. Attractive, well-kept homes are coming to mean more and more both to the farmer and business man.

"I helped lay the retaining wall and laid nearly all of the wall for the new ice house alone. Besides that I have learned to paint. Then, what is more important, I have obtained a good idea of just how such a project should be carried out and have had the necessary practice in actually planning, managing and keeping a complete record of work done, amount of labor and expense.

"I am glad I could get this training in school and consider myself more than fortunate in having the help and teaching of one of the finest agricultural professors in the state. Not only will this training help me to take care of and improve my home but I will try to make the community in which I live better and will aid to the best of my ability in arousing the interest of other boys to learn to love agriculture."

With the assistance of Mr. L. P. Guillaume, teacher of agriculture at

For the Home Beautiful

By H. C. FETTEROLF

Troy, Charles has figured the improvements that he has made in the farmstead to be approximately \$1,000. Some day Charles expects to become the proud owner of this old farmstead which has been in the family for several generations.

A Florida Farmer's Views

By CHAS. F. LEACH

ONE of the great mercies I am thankful for today is that the editor of one farm paper, at least, has got some real common sense and the ability to see the fallacy of this wonderful plan of our great and good President to cure the alleged farm surplus evil by lending vast sums of money to the surplus producers to encourage them to increase these surplus farm crops. To call this relief for the farmers is ridiculous, for real farmers can never lay their hands on a cent of this charity money unless they produce something already overproduced and can join a very large coopera-

Shrubbery adds to the beauty of any home.

tive society, which is quite impossible for any farmer who is wise enough not to spend his time raising something the world does not need or something in excess of the capacity of the world to consume.

In south Florida the fruit and winter vegetable growers already produce more than can be consumed in the North and could produce all the winter vegetables the entire Northern Hemisphere could eat. They have large cooperative organizations and can get this cheap government money to increase their plantings of surplus crops.

They cannot and do not try to produce anything for the people of Florida to eat eight months in the year. South Florida produces and ships north every year \$100,000,000 worth of winter vegetables and fruit. Then we turn around and buy in the North \$127,000,000 worth of food to feed ourselves. We buy in spring, summer and fall about \$12,000,000 worth of fresh vegetables from the North; yet in middle north Florida we can grow to perfection, in spring, summer and fall, every vegetable ever grown in the summer in any part of America.

Without any aid from the government—or any one else—I am growing 24 kinds of vegetables in commercial quantities and selling it all, by my lonesome, at very profitable prices right here in Florida. But there is not another grower of summer vegetables (commercially) within 100 miles

A view of the retaining wall and shade trees.

of me and probably there are not 50 vegetable growers between Jacksonville and Pensacola.

It is obvious this production of summer vegetables for consumption by Florida people is an industry that should be encouraged if any industry should be subsidized by the government. But although I personally need no help or cheap charity money, tell me how I am to form a cooperative organization that the Farm Board will consider worth while or to which it will lend any money. Tell me how I can get real truck growers here to take advantage of my pioneering demonstrations. The natives are cotton farmers.

Mr. Hoover devoted one short paragraph in his farm relief message that contained the only idea that I think should be considered. No one paid the slightest attention to it. I cannot quote that paragraph accurately, but as near as I can remember Mr. Hoover said that one of the great drawbacks to prosperous agriculture is the unequal distribution of farmers.

Broadly speaking, there are no real farmers in the lower South and very few in the upper South. Cotton growers are not farmers. They don't know anything about real farming, have no farm ideals and do not live or eat like real farmers. It is no exaggeration to say that ninety per cent of the cotton growers of the South are undernourished and a very large percentage are suffering from some form of semi or complete starvation. They would resent this statement simply because they don't know what ails them. Pellagra in some form is a universal disease in the South and pellagra is nothing but starvation.

I have been one of the advocates of the so-called Southern Reclamation Projects to which you have been strongly opposed. But, Mr. Bayard, you don't understand this problem. We have no thought of producing anything to sell in the North, nor for export. On the contrary we want to wean the South from producing so much low-grade cotton and induce it to produce food to feed itself and end this terrible condition of semi or complete starvation.

Cherokee Farms was established and has been operated for eleven years for this sole purpose. We have set an example that at last is being followed in our small area in some lines of farming. I have never drawn a salary and my living expenses are paid from other income. The other stockholders have never had a dividend and never expect one. The farm is not run for personal profit, but it would fail as a demonstration if we made none. However, every cent of profit is spent to spread the gospel of real farming by real farmers and our success has been gratifying. But one man on one small farm is lost in this semi-wilderness where the population is being rapidly reduced by starvation and emigration.

The same conditions in Russia or China would bring millions of relief money from the well-fed people of the North. Even the wheat growers ship starving Russians wheat by the shipload but will fight any effort made to induce southern people to raise food for themselves to eat.

We who are backing the so-called Southern Reclamation Projects simply want a few farming communities—of real farmers—established in the South and financed by the government to do the same work and set the same example that Cherokee Farms has been doing. We do not want to drain or irrigate a single acre. It is not necessary or desirable to clear any new land, as there are many millions of acres of old cotton plantations already cleared that are now lying unused and practically abandoned from which the population has been driven by starvation because they did not know how to raise their own food.

There is opposition to our project and aspirations in the North by those sections that have been producing the food heretofore consumed by the people of the South. They say that if we produce our own food their markets for meat, corn, eggs, hay, poultry, milk, butter and vegetables will be restricted. Laying aside the inhuman selfishness of this argument it is a fallacy because the southern outlet for northern farm products is rapidly vanishing; for millions of consumers are leaving the South every year starved out.

I did not intend to write you anything but a complimentary letter on your comprehension of farm relief (?), but being full of farm relief I have not been able to restrain myself so air my views.

Power on Penn'a Farms

By TUDOR J. CHARLES

IN ten years, from 1918 to 1928, the Pennsylvania farm population declined from 30 per cent of the total to less than ten per cent. Yet Pennsylvania farmers produced approximately as much in 1928 as they did ten years earlier, demonstrating that one man is able to produce three times as much as he did at the close of the World War. It is no mere coincidence that in the same period the number of farm tractors in the state has increased from 5,000 to some 35,000.

Prof. R. U. Blasingame of the Agricultural Engineering Department of the Pennsylvania State College predicts that within the next decade agricultural advancement will be speeded up to an even greater extent, and he foresees in the not distant future the total mechanization of eastern agriculture.

One thing which farmers are realizing, as they turn to power farming, is that low power costs come from putting to profitable use as many hours of available power as possible. The tractor should replace as much potential horse power as it is capable of supplanting, for with each hour of use the average hourly cost is reduced, due to the fact that fixed charges of interest, depreciation, housing, etc., remain practically stationary regardless of time used. Since these charges amount to over 50 per cent of the total, their reduction on the hour basis is desired.

Pennsylvania farmers are making their tractors pay by using them to fill silos, thresh, shell corn and do other belt work, while at the same time they depend on them to do the greater part, or in some cases, all of the field work.

This wide adaptation of power is due primarily, in the East at least, to development of the versatile general-purpose tractor. When one man can plant two or more rows of potatoes, or three or four rows of corn in one trip through the field, then substitute a cultivating attachment and weed from two to four rows at a time, he can reduce man labor materially. Figuring the greater speed of the tractor, labor is cut practically in half.

Tests at State College have determined these facts: For cultivating corn with a two-row power outfit, the man-hours per acre are less than half those required when common practices are followed and single row machines used. In potato cultivation slightly more than half as many man-hours are necessary for a given acreage.

When we consider that mechanical power will reduce labor by about half, or double the speed with which work can be done, it follows that it will cut costs to a minimum only when it is allowed to operate close to capacity. This is possible by increasing the acreage, or reducing horse power.

Farmers have found one thing—they can depend on their machines to give constant and steady service, and work overtime day after day as well. Long hours and little rest have no effect on a tractor's constitution.

New tools for general-purpose tractors which

Power sprayers do their work quickly and well.

This farmer is using a tractor to cultivate corn shoulder high.

will do practically all farm work are going to speed up adoption of mechanical power. Since potatoes are a major crop in Pennsylvania, and growers in this state have been leaders in use of improved methods, we can look first at some of the tools which spell "spud success."

Soil preparation is a simple matter of disk-ing, harrowing and pulverizing. Planting time no longer sees hand dropping, but automatic or semi-automatic machines in one and two-row sizes. The last year has seen announcement of a three-row automatic machine.

In addition, better spacing and covering apparatus is used than in former years. One idea is to cover the seed shallow in the trench, with the advantage in mind of allowing more warmth from the sun to penetrate the seedbed.

Fertilizing attachments are available for planters and are widely used. State colleges, equipment manufacturers and other interested groups are working together to improve fertilizing machinery and step over or around factors that interfere with application of the commercial product.

the surface and leave them in a trail along the row, but also drop them in piles. Still another development is a combined digger and sacker which elevates the spuds over a shaker chain, and then drops them into bags. Five men are necessary for complete operation of such a machine.

Corn production can likewise be completely mechanized. Tests show power methods to be cheaper in all operations except planting, where the two-row planter when drawn by two horses cost somewhat less per acre. Use of a three- or four-row tractor hookup might change the situation since power cost was the factor which made tractor planting more expensive.

Probably the latest power development in haying equipment is the wide cut tractor mower which is carried on the drawbar and operates from power take-off. The practice of curing hay in the windrow has also helped to adapt power to haying, for the side-delivery rake may be drawn behind the mower, eliminating necessity of an extra team.

Although this practice has been followed by quite a number of farmers the past few years, a few words of explanation may be in order. The left-hand rake as it follows the mower turns the leafy part of the plants toward the center of the windrow. The stemmy ends are exposed where direct sunlight can dry them quickly. The leaves dry just as quickly for the row is light and airy. This plan demands less time all around, and damaging rains are often avoided. In case rain does fall, however, the windrow may be turned with the rake. Little deterioration is noticed if this is done.

The experiment station tests again showed considerable advantage to tractor power for grain growing. In all operations, including plowing, pulverizing, harrowing and harvesting, there was a saving of 19 per cent in power, labor and machinery cost. This average included acre costs of plowing on extremely stony soil, as well as moderately stony fields and those with few solid rocks. One can see that increased acreage would result in lower costs, as the figures were based on like areas.

We have mentioned briefly two main items in lowering production costs. One is belt work, the other larger acreages—both mean greater hours of use. Another, which means the same, is diversification.

While some sections of the country must stand pat with one or two crops, Pennsylvanians with their diversified farms can rotate both their crops and their time. They are doing this to a large extent and it is good business.

To Clean Area of Abortion

Dairy leaders in Winslow, Washington and Clover townships of Jefferson county, Pa., are making determined efforts to clean up these areas of contagious abortion. The half way mark has already been passed and the accomplishment is clearly in sight. When the campaign is completed, it will place this area in the very forefront for freedom from both tuberculosis and abortion in cattle throughout the whole country. W. H.

"LOOKS to me like a cross between a floating coffin and a cord of kindling wood," said Toots.

Rose appeared a little huffed at this. "Is that so?" he replied. "You're a trifle too smart, young man. What do you know about steamboats anyway?"

"Well, you asked me," Toots defended himself.

Rose walked away without deigning a reply, but after supper he became more communicative. He was not one of the kind to keep his own counsel very long. As a matter of fact he was bursting with a piece of news. It seemed that a man named Rand, an old Shell Harborite, had introduced him to one George A. Hakewill, a capitalist. At least Rand had intimated that Hakewill had money. He was a kind of quasi-scientist too, a collector of rare sponges, shells, fossils and other similar peculiarities.

"And a man must have money if he can afford to go diggin' up such things," commented Rose.

"He must have more money than brains, I reckon," said Toots.

"Sufferin' Susan! You're the biggest ignoramus I ever did see," exclaimed Rose indignantly. "Don't you know that that shows brains? Don't you know they build museums as large as the whole of Shell Harbor just to put fossils in? Don't you know it takes a man years to know where to look for 'em, and more years to learn what kind of a fossil it is when he finds one?"

"How old is this Hakewill?" asked Toots.

Rose snorted. "Never you mind how old he is. Just you remember this. If George A. Hakewill owned a million dollars cash he'd still have more brains than money."

Toots digested this in silence. Presently Rose went on in a milder tone. Mr. Hakewill, who had been pottering up and down the coast on collecting trips, had conceived the brilliant idea of resurrecting the old local steamboat trade. He had studied the business situation and the existing docking facilities, and after an exhaustive investigation had decided that his plan was a sound one. He had bought up two or three old but serviceable boats, such as The Blue Heron, then lying in Shell Harbor, and was conducting negotiations looking toward the purchase of others. Later on he intended to build some up-to-date craft.

"What do you think the railroad will say to it?" asked Toots cautiously.

"It won't make any difference what they say," retorted Rose. "The merchants and truckers want the boats back and I guess they're strong enough now to get what they want."

Toots didn't feel so sure, but he couldn't formulate his objections. He could see that Rose was much prejudiced in favor of the scheme anyway. Rose himself acknowledged that he was. He had even gone so far as to intimate to Hakewill that he might be persuaded to invest some money in the enterprise, after he had looked into it thoroughly, of course. He, Hakewill and Rand, who was also interested, were going to make a trial run in the Blue Heron tomorrow. If Toots wanted to come along too, he was welcome.

Toots' attitude immediately became less critical, and he accepted the invitation with enthusiasm. He also resolved to look up the subject of fossils.

When Zach rowed them over to the Blue Heron the following morning, Hakewill, Rand and the crew were already aboard. Volney, the engineer, had got up steam, but he didn't like the look of things. "I'd be verra pleased to quit the noo," he stated emphatically. "There's things aboot this contraption I dinna understand, which ain't so surprisin' considerin' I'm no in the naval line. I'm a stationary engineer."

"POOH, pooh!" said Hakewill. "You're a good man in any line. You know it and I know it. But you Scotch love to grumble. There isn't a ripple on the lagoon, man. A sieve would be safe this weather. You're not going to let these friends of mine think you're scared?"

Volney went below, growling, to join his two negro hands. The others manned the capstan and drew up the dripping anchor, after which all trooped into the little pilot house. Hakewill shouted an "all right" into the speaking tube and took his station at the wheel. Things began to clank and grind below through the steady purring roar of steam, and the big paddle wheels harshly and jarringly revolved with a sound that suggested rusty gears. The Blue Heron swung her nose toward the harbor entrance and glided with almost a state-of-the-art air from her mooring.

Rand, Hakewill and Rose plunged at once into business. Toots sat on one of the little lockers listening and enjoying himself immensely. He was especially interested in Hakewill who used big words fluently, in an impressively off-hand way. Hakewill was a lean stick of a man in a rumpled Palm Beach suit. Physically he was as thin and

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Slocum Company

Synopsis

Toots Pouche, an orphan boy with no job, spends his last dollar to rescue a dog from a fight with a captive wildcat. The boy secures employment at the Broad View Hotel, a likely place run by a southern gentleman apparently more for love than for money, since it is evidently not a paying proposition. The Colonel dies suddenly after arranging for Toots to have his library. The boy and his dog are now part of the crew on Jack Rose's craft the Stingaree.

The ship's cook, Zach, and Toots have an exciting experience in the village when Zach is mistaken for a chicken thief. Back on the ship all hands are now interested in an ancient, shelly-looking craft anchored in the harbor.

yellow and juiceless as an old fall corn-stalk. He had almost no hair under his limp Panama. A few dry straggling wisps of tow-colored beard clung precariously to his chin, and it seemed to the fascinated Toots that it was only a question of time when they would be wagged off by their voluble possessor. But Mr. Hakewill's eye, though it looked as if it had been dimmed by years of peering into the history of fossils, had a compelling power that Toots rightly laid to intelligence. You could not meet Hakewill's eye without experiencing the curious sensation of being mentally turned inside out.

Toots admired the way Hakewill took control of the conversation. He altered its course just as readily as he did that of the Blue Heron. He switched from business to personalities. But on

The Cheerful Plowman

CAN'T REJOICE AT ANOTHER'S HARD LUCK

I HAVE one neighbor, I must say, who seems to take delight in seeing some one's luck give way, his day turn into night. When Dan McDuffy's daughter Nell eloped with Peter Penn, this neighbor said, "That suits me well!" The evil-minded man!

When hail hit Hal McQuarry's wheat but touched no other farm, that neighbor said, "It's worth a treat." He wished his brother harm. When Old Sal Sidenback was kicked by Phil McDougall's horse, that neighbor said "At last she's licked!" and he rejoiced, of course. When Barney Garterswish came back from New York with the flu, that neighbor said, "I feel, alack, is serves him right." Mon Dieu! When Henry Hein, mistaken lad, bought copper stock, or tin, that neighbor said, "Hein needs the shock, 'twill teach him!" Sin, oh sin!

When calves have croup, when hens have heaves, when pigs have mumps and grippe, when mould gets in the barley sheaves and tom cats get the pip, so long as others bear the brunt of all such grief and care that neighbor has a grinning front, delight is written there.

I'm not that way. It grieves me sore to see another hurt. I hate to see him topple over or grovel in the dirt. Be his misfortunes battered grain, ailing girls, or what, be it a cushion of the brain, or market tomy-rot; be he the victim of the flu, a falling price or pail, I'm right on hand. I'm telling you—I would not have him fall. The kindest word I know is his, "Too bad!"

I tell the folks, "I know just what such trouble is, misfortunes aren't jokes! Let's take him down some catnip tea, some biscuits light as air; let's show him succor full and free, let's show how much we care." How can that neighbor fellow grin when girls elope, I say, or when a baby downs a pin, or mule team runs away?

—J. E. T.

second thought Toots wasn't so sure that the latter were not good business too, for Rand, who was a lawyer, was evidently pleased when Hakewill told of a clever piece of legal work he had done, and Rose swelled up like a pouter pigeon at a flattering allusion to his international reputation as the "modern Hercules."

"It's been the regret of my life that I never witnessed one of your exhibitions," smiled Hakewill. "I feel like asking the natural question of the average small boy worshiper: 'How strong are you, Mr. Rose?' I suppose you could answer that by giving a hundred different illustrations."

Rose grinned with gratified vanity. He was never tired of this topic. "That's right," he acknowledged. "But I'll tell you one thing that maybe'll give you some idea."

"Suppose you give a practical demonstration as well by taking the wheel for a spell," said Hakewill. "If you'll be so good. She steers exceedingly hard."

Rose laughed and grasped the spokes, but before he could begin one of his boastful stories a whistle from the engine-room cut him short. Hakewill picked up the speaking tube.

"Hullo, what's up now, Volney. Don't like the way she's acting? Why, she's doing finely. Keep her to it and don't get nervous, man. Keep her to it, I say." He hung the tube in its metal fork. "He's so full of Scotch blood he can't help finding fault," he remarked.

The Blue Heron had run well out into the wide lagoon, leaving the little hard green-and-white town a blur astern. A fleet of becalmed mullet seiners lay about a mile ahead in a compact bunch. A glance through the glasses showed that the men were eating an early lunch.

"Let's have a look at the engine-room," suggested Rose. "Toots, here, can take his trick at the wheel."

As the others left the pilot-house Toots took the spokes. He saw at once that she steered hard, but it was fun to handle her nevertheless. For the sheer pleasure of feeling his control over her he swung her about a bit. They were following no particular course and had all the lagoon to play in. "She's got too much slack in her chains and too much weight forward," he reflected. "But I'll say she goes fast."

At that precise moment the Blue Heron gave a peculiar shudder that made her deck timbers crawl, as a horse twitches its skin to dislodge a fly. A dull, oozy, puffing report followed, and then a more racking shudder. Toots instinctively started to run, but recollected that the man at the wheel should be the last one to leave his post. Running feet pounded on the deck and Hakewill, followed by every manjack aboard, began to surge into the pilot-house.

"WETTER get these things on," cried Hakewill, hauling the life preservers from their rack.

"What's happened?" asked Toots. "Engine's busted," said Rose. "Confound these things. They ain't any of 'em big enough to fit a real man."

The Blue Heron gave a wild yaw. "Mind your helm!" cried Rose sharply. "You're headin' straight for them boats." Seeing that Toots could not change the course Rose put his foot within the rim and threw his weight on the wheel, which gave a little and then locked. Crack! Crack! Both spokes broke short off in Rose's powerful hands.

Leaking steam was oozing through the after-deck, but the Blue Heron seemed to be going faster than ever. Dead ahead lay the seiners. As the Blue Heron continued her bull-headed rush straight at them alarm spread over the fleet. Men began to stand up, waving sandwiches and coffee mugs. A confused chorus of directions and execrations arose then a sudden hush fell.

It was followed by a mad activity. Men ran out on bow-sprits and leaped off, dove from sterns and vaulted over cockpits. Their sleek heads radiated away from the boats, each head at the apex of swiftly lengthening ripples. The Blue Heron surged into the fleet with her paddles chattering. She struck the nearest seiner a glancing blow that almost put it under. One, two, three more jarring blows, a vision of wildly reeling masts and the brutal sound of the paddles chewing up wood. In the midst of the confusion Volney's two negro helpers sprang overboard like terrified frogs. Then the Blue Heron drew clear of the wreckage.

"There's a flat yonder," shouted Rose. "She'll strike it sure. Come aft of the starboard box and jump when I say so."

As they staggered aft Hakewill cast a scared glance at the seine-boats. "Hope we didn't hurt any of those fellows," he shivered.

(To be continued.)

Tabletalk and Food

By HEPSY NEFF

PERHAPS the man is still living who made the great study of what the mind can do to help or hinder appetite and the digestion of food, using dogs for his purpose. Few of us have escaped trying experiences which made eating impossible for a time. But one experience will not help the world. This scientist with a keen, inquiring mind thought out a way to open a hole into the stomach of a dog, fold the skin back in trap-door fashion, heal it and keep it healthy, fit a protective harness around the dog and study its digestive processes at first hand.

Many dogs were studied, once the plan was perfected and a long record of results was secured. Each dog was in charge of a student-master whose first task was to make himself the familiar and trusted friend of the animal. The method was to bring the dog within sight and smell of a morsel of fresh meat, open the door into the stomach and watch what happened. Always the deepening color and inflow of the digestive juices followed the sight and smell of food. Then it was found that with the food almost within reach, if a dog was sharply checked, roughly handled or scolded the usual signs of stomach action were stopped and did not go on until a friendly attitude was restored. But homeless dogs, street dogs accustomed to fighting for their food and mongrel curs could persist in a disturbing conflict with little or no check to the digestive juices while well-bred and well-cared for dogs showed no signs of appetite.

There is a world of meaning in these facts, the results of a man's patient study in the interests of human welfare. Perhaps a "will-to-win" even in a dog is something to be desired but a human being can use such a purpose to wise ends only when a clear brain is in control of all its forces. Strife, anger or contention leaves the mind like a machine with its most powerful parts disconnected. Power to make a personality depends upon joy, happiness. It must grow from within.

Most of us know very little about electricity except in its effects but we know it has tremendous force. So happiness, joy is an accumulation of very small things as well as large things. The joy of discovery, from the finding of the first wildflower of spring to the finding of a new continent which Commander Byrd and his companions have recently made the greatest achievement of the twentieth century; the joy of any work well done; even the catching of the faint, sweet note of a bluebird when those around you hear nothing because they have not learned to listen; all these joys are in the same class and make their contribution to a successful life.

Nowhere can such small joys be used with such good effect as at meal time when the family have gathered around the table and care is for a time, forgotten. It is a great privilege to feed and build a smoothly running body-machine. It is more and more a greater privilege to build a sound mind, able to use to the full the sound body which Infinite Wisdom has made possible for all children.

We have only begun to learn the meaning of meal time when each contributes something to the table talk; some new joy born of discovery, good work, real gain; the greatest means of promoting health within our reach.

The Farm Home

Money at Home

By L. M. THORNTON

A MIDDLE-aged woman, living not far from a city, yet off the state road, found herself in need of extra money. Summer boarders might have solved her problem, yet she was not strong enough to do extensive cooking during the hot months, and she was too far out to make renting rooms a success.

She had a very pleasant home, was in good health (although not strong), and her sunny disposition made her the "adored" of small nieces and nephews, and their little friends. This last suggested the thought that this might be her real talent. If children loved visiting her why not board children as a means of earning money?

Through advertisements and friends she made it known that she would take a limited number of children for week ends, vacations or for the entire summer, and soon she found that it was well she had specified a limited number.

Mothers who wanted to go away for a week end brought her their children while they were away. Mothers who were to be patients at the hospital for two or three weeks did the same. Mothers who were preparing for a visit from the stork urged her to take the older children, and one stranger to whom her praises had been sung entreated her to take her little girl who was nervous, and oftentimes ill-tempered, as the doctor had suggested that she was playing too hard with other children and needed at least six months in a country home.

When she found that her plan was to be a real success she hired a young girl to look after the heaviest work, this giving her more time to spend with her children, as she called them.

She charged the same for a child that she would have charged for an adult, but their meals were much simpler, consisting of fruit, whole wheat bread, toast, cereals, salads, eggs, fresh vegetables, chicken and very little meat. They were also given bread and milk as a fourth meal, just before bed time.

In addition to her visiting children as she called those who remained for days or weeks she had two who knew no other home. The father of one brought her there when she was three years old and was the only adult who was given board. He came every week to visit his little daughter and remained over one night. The other was a boy whose mother was employed and she could not have him with her. Although she saw him but seldom, checks for his board and clothing came regularly.

Work of this kind is especially desirable for women who have no children now in the home. Parents seem especially willing to leave their little ones with a woman who has raised a family.

Never let woollen garments freeze after laundering, as it is likely to cause shrinking.

For good health in winter, children's knees should be well covered. This helps keep up an even body temperature.

Porous garments which hold air and help in the ventilation of the body conserve warmth and health better than does heavy, compactly woven underwear.

A WEST VIRGINIA reader recommends that we try a red hot poker point next time we need to remove old putty. She says you apply this heat slowly to the dry putty and it causes it to leave the wood. Then a bit of prying with an old knife, and the putty comes out in long pieces leaving the wood clean.

Radio Hour

THE National League of Women Voters has planned a very splendid Radio program for the new year. On each Tuesday evening at seven o'clock, let us be ready to "listen in" while we darn the family socks or do a bit of finer needlework. The January addresses are as follows:

January 7.—"Education by Radio," by Hon. Ray Lyman Wilbur, Secretary of the Interior.

January 14.—"What has been Happening in Congress," by Charles G. Ross, well-known newspaper man. Also "What has been Happening in Foreign Affairs," by Hon. Wm. R. Castle, Jr., Assistant Secretary of State.

January 21.—"New Trends in Government," by Miss Belle Sherwin, president of the National League of Women Voters.

January 28.—"Recent Developments in Tariff Legislation," by Charles G. Ross.

This half-hour of education specially planned for all the women of our great land should be very helpful to the farm folk. Remember the time—each Tuesday evening at seven o'clock, National Broadcasting Co.

Did You Ever Try This?

DISCARDED coats used to accumulate pretty fast around here, and I have this one use for them that might not have occurred to others. The Home Pages are such a help and inspiration to me that I would like to offer this suggestion for my sister readers.

I rip the seams carefully and make the longer pieces into warm slips which we find very comfortable during winter. They are too heavy for tops as a rule, but are easily attached to lighter weight material. These slips wear very well too.

Mrs. C. L. L.

To cover meat with a mixture of vinegar and oil and allow it to stand a few hours before cooking will help make it tender.

Kitchen in the home of Mrs. Harrison S. Nolt. Notice the sink with double drainboards and swinging faucet. A roller shade on the lower part of the kitchen cabinet hides the implements and materials which cannot be put away elsewhere in the cabinet. The electric range at the right has done all of the cooking for this family for four years. The fireless cooker beside the range is now used only as a table. It has been supplanted by the range. Observe the fire extinguisher. Mr. Nolt is one of Lancaster county's Master Farmers.

PREVENT

COCCIDIOSIS

You can prevent the ravages of this dread disease among your young chicks, and save grave financial losses by dipping the unincubated eggs in a solution of

IODINE SUSPENSOID MERCK

Iodine Suspensoid does not in any way affect the hatchability of eggs, but kills all the oocysts of Coccidia that may adhere to the shell. Simply submerge the eggs in a solution of 1 lb. Iodine Suspensoid to 1 gallon of water, for about two minutes. This solution may be used over and over again until exhausted provided it is kept in a glass container well sealed when not in use.

Clean out the brooder houses with Iodine Suspensoid solution before putting in young chicks. Each pound of Iodine Suspensoid properly diluted with water will treat approximately 400 square feet of floor space.

Effective every time, easy to use, economical. Used by leading Hatcherymen. Approved by many agricultural colleges and experiment stations.

LORD FARMS

S. C. White Leghorns
Valuable Text Book
FREE
to Eastern Poultrymen Only.

Hundreds have started in the poultry business, relying entirely upon the information in our Year Book. And they have made good. Even the poultryman of 15 years' or more experience will find in it many helpful pointers.

Mailed free on request to poultry-keepers east of the Mississippi River. \$1.00 a copy to those further west. Send for your copy today.

LORD FARMS GRADE-A CHICKS are guaranteed to pay better than any other chicks, or we will refund the difference in price paid. Produced from breeders on our own farms.

LORD FARMS
90 Forest Street, Methuen, Mass.

Wellington J. Smith's New Simplified Little Boy ELECTRIC INCUBATOR

For Farmers and Breeders. 500-egg capacity. Automatic temperature control. All mechanical, white enamel finish. Surprisingly perfect. Send for FREE folder.

Exclusive feature. Automatic heat control. Rates: 24 - 100 chick size \$10.75; 24 - 100 chick size \$16.00; 24 - 100 chick size \$20.00; 24 - 100 chick size \$24.00. Write for details. Order now direct. W. J. Smith Co., 725 Davis-Farley Bldg., Cleveland, O.

STICKLER'S TANGLED S. C. WHITE LEGHORN BABY CHICKS

Late also, heavy laying production. 4 to 5 lbs. weight. 4 to 5 lbs. weight. No extra quality chicks from these flocks. Shipped direct. \$16.00 per 100. Also White Rocks and Bantams. Write for details. Catalog free. LEONARD F. STICKLER, Box F, Sheridan, Pa.

BLACK LEGHORN

DAY OLD CHICKS. The kind that lay. Cheaper than A. E. HAMPTON, Box F, Pittsboro, N. J.

A Warm, Light Brooder House Is One of the First Essentials of Successful Poultry Production

Poultry Problems

A New Disease?

I have 115 Leghorns in a coop 20x20 feet. I feed all the mash they want and 12 pounds of cracked corn in the evening and four in the morning. Grit is in front of them all the time. They started to lay at five months old. They were laying 40 to 50 eggs a day until a week or two ago their combs turned pale and I am getting 18 to 20 eggs a day now. I killed one and found that one egg was like a pea and had blood in it and two were hard and the rest were rotten. John J. Turouski.

DURING the past few weeks there has been prevalent in poultry flocks throughout this state a disease which is causing a decrease in egg production but very little mortality. This disease affects the birds in the following manner: Egg production declines rapidly, the birds' combs turn blue or purple, a diarrhea condition is present and the birds often show signs of molting.

As to treatment, I would suggest that you give the birds Epsom salts at the rate of one pound to 400 pounds of chicken, withholding the night and morning feedings before the salts is given. After the salts treatment, supply the birds with an abundance of water. The salts may be fed in a moist mash in the morning. In addition, remove the scratch grain, feeding the birds only on mash and if possible flush them with liquid milk or buttermilk. One treatment of Epsom salts is sufficient but the feeding of milk and the reduction of the scratch grain in the ration should be continued for two weeks. After this time gradually work the birds over on the regular ration. H. C. K.

About Geese

I have enjoyed reading your articles in Pennsylvania Farmer. They are practical and very helpful. The articles on geese I have found timely and I want to ask you a few questions about some geese I have.

I have some early pure-bred Toulouse geese, hatched from a goose that laid 46 eggs last year (which was her first year) and 53 eggs this year. What do you think would be a fair price to ask for them? This goose began laying the latter part of February and laid until the last of May.

Is it unusual for a Toulouse goose to lay as many as 53 eggs?

Will salt kill geese?

What should be fed to supplement dry grass in summer? Halile B. Willis.

GEESSE for breeders bring from \$5 each on up, depending on the breeding, size and other individual characteristics. Good geese should bring two or three times the price quoted, which is a minimum. If the eggs from your hen hatched well, she is a valuable bird, as she laid about twice as many as is common, and should be kept as long as she breeds well.

Salt is toxic to most domestic fowls in quantities greater than one per cent of the feed, but I cannot tell you just the effect on geese.

For roughage at any time, green grass, waste vegetables, apples, weeds, etc., are relished by geese.

The U. S. Department of Agriculture, Washington, D. C., publishes an

interesting farmers' bulletin on geese, which is free if you write for it. R. L. S.

Probably Too Much Grain

I have two pens of White Leghorn pullets, 200 to each pen. One pen was hatched April 7th, the other May 1st. For the past four weeks have had as high as six cases of prolapsis in one day. Have lost about 35 so far. The ones that did not die bled at the vent and then in a few days pass a white substance.

I am feeding a good commercial mash and about three pounds of dried buttermilk in a moist mash each day. Also feed sprouted oats and 28 pounds of scratch feed to each pen. They are laying from 25 to 30 per cent. Would too much grain cause it? Is it possible for it to be bred in the chickens? Robert L. Wright.

YOUR pullets are not laying very heavily, and I judge that you may have been giving a little too much grain so that they are over fat. Very often an accumulation of abdominal fat predisposes to prolapsis. Constipation is another cause, although since you are feeding sprouted oats and buttermilk, your pullets should be in good loose condition. If you think it desirable, give a light dose of Epsom salts, say one pound or less to each pen in the drinking water, and if your birds are pretty fat, cut down the grain somewhat until they are laying around 50 per cent, when the quantity can be increased.

When a bird with prolapsis is found in time, the protruding parts, can be washed with a mild antiseptic and returned to the body cavity. The white substance you mention is the result of infection. However, it generally pays to kill the bird immediately and use it for food, as infection may set in or the trouble recur.

Some poultrymen believe that the tendency to prolapsis may be present in a particular strain. H. L. S.

Weight of Eggs

Please let me know how many ounces a dozen of eggs must weigh to pass for highest prices in New York market, also weights of second and third. Are the weights the same the year round for nearby extra selected white eggs in New York?

Does it pay better to grade eggs and ship to New York than to sell eggs at Philadelphia, quotations as they come from nests if I receive extra first price? Jonathan K. Benner.

THE weights of eggs you ask for are: Extras, 24 ounces per dozen average, with a minimum of 23-ounce eggs; mediums, 20-23 ounces per dozen; pullets, 18-20 ounces per dozen. The market makes further grades according to interior quality of the egg and color of shell, including presence or absence of tints.

Whether it would pay to ship to New York rather than to Philadelphia would depend not only on the difference in price but also on the number of eggs you have to ship, their quality and the way they grade up. If I understand that you are receiving top price for run of nest in Philadelphia I think you had better continue, unless you are getting a great many eggs. R. L. S.

HATCHERY CHICKS weigh more than 2 pounds at 10 Weeks of age

—says Elma N. Buchanan, who was awarded a Prize of \$25 for her experience with Hatchery Chicks

"LAST year I raised 346 out of 350 Hatchery Chicks," writes Elma N. Buchanan, of Indiana. "At the age of 10 weeks, some of them weighed 2 1/2 pounds. By the time they were 12 weeks old I had sold the whole bunch for \$350.42."

Bigger Profits with Less Work and Worry. Think how many eggs you would have to set to have 346 broilers and pullets. Think of the worry, the trouble, the losses. Then compare this with the convenience and economy of getting big, strong, healthy chicks from a reliable hatchery—all the same age.

Poultry raisers by the thousands know the advantages of Hatchery Chicks. They're making money. And they give the credit to Hatchery Chicks. Can you afford to neglect this way to make money?

Send for FREE Book. We want to give you all the facts. We want you to know why Hatchery Chicks give you a chance to double and triple your profits with no more time and attention than you are giving your flock today.

All this valuable information is given in our FREE Book, "How to Succeed with Poultry." Send for your copy today. Simply sign and mail the coupon—TODAY.

Biggest Healthier Flocks with a LEOLA BROODER HOUSE

Every year you can raise 95 per cent of your chicks to maturity in a Leola Brooder House. The Leola is built entirely of wood, it is round, eliminating all sharp corners where dirt accumulates and chicks huddle together and are killed. The Leola admits plenty of light and sunshine. A uniform temperature may be kept at all times and the house is easy to ventilate. Raise your chicks the Leola-way for healthier flocks and bigger profits. Write for details of this remarkable house.

The Leola Brooder adds pounds to your hog and subdues dollars from your feed bill.

Nest Box Notes

By R. L. SCHARRING-HAUSEN

I RECENTLY had occasion to do some whitewashing, and made a mixture of 50 pounds of finishing lime, two pounds of powdered glue and enough hot water to moisten thoroughly. Dissolve the glue in the hot water. This whitewash sticks like paint.

DECEMBER has been full of concentrated meanness, so far as the weather goes. We have had a few nice days, but a lot of cold weather, high wind, snow, rain, sleet and fog. Just as I write this it is so foggy outdoors that you'd get lost going to the barn. Foggy weather means damp litter, which in turn means get busy and clean it out as soon as possible.

TURKEYS seem to be pretty cheap this year. The dry season gave the poults a chance to grow up without getting soaked, and the new turkey raising methods enabled a lot of growers to raise large flocks, so that the supply was more liberal and prices lower.

RIGHT now is the time when many forward looking poultrymen are getting ready to place their orders for chicks. Early ordering means a choice of dates, whereas late ordering often means that chicks cannot be obtained just when wanted.

Turkey Lays 151 Eggs

I WAS reading in The Pennsylvania Farmer where a man owned a turkey hen that laid 97 eggs in a season. Mr. and Mrs. Wilmer Berry of Marshall county, W. Va., own a Bronze turkey hen that started laying March 25, 1929, and laid until November 27, 1929. During this period she laid 151 eggs. She never sat during this time.

Who has a turkey hen that can beat this record?

C. B. Allman.

Bronze Makes Record

I NOTICED a report in your paper of a turkey hen that laid 97 eggs. I bought a pure-bred Bronze hen last fall that has laid 169 eggs. She laid ten eggs and wanted to sit. I broke her up and she started to lay again in a week and has never missed more than a day or two at a time, until she got hurt, accidentally.

I changed her feed several times, thinking it would make her stop laying and molt, but it had no effect on her.

Mrs. G. D. Barnes.

Merced county, Pa.

Lame Pullets

What could be the trouble with my lame pullets? They start to get lame and stiff and in a few days can't walk. Some can't hold their wings in place.

Mrs. A. L. H.

THE trouble with your pullets may be due to worms, which can be determined by sitting the intestines of a dead bird and examining the contents to see if the intestinal parasites are present. In case you find worms, use one of the poultry vermifuges which you will find advertised in this and other poultry papers.

If worms are not present, the disease is probably range paralysis, a rather mysterious ailment for which there is no certain cure. Some poultrymen have given paralyzed birds chloris powder with good effect. I understand that birds exhibiting the first stages of range paralysis are fit for food.

R. L. S.

Charles Pike Stages this Egg Contest to prove which feed is best

B-B

LAYING MASHES

Vitaminized with Cod Liver Oil and B-B Scratch Feeds are guaranteed to give most eggs or money back.

CHICK STARTER RATION

combines in one mash all ingredients needed for baby chicks. Also supplied separately in B-B Baby Chick Feed.

GROWING RATION

combines in one mash all ingredients needed for growing birds. Also supplied separately in B-B Growing Mash and B-B Developing Feed.

DAIRY FEEDS

24% Dairy Ration, 20% Hi-Test, 16% Marmico. A protein content suitable for every grade of roughage.

BULL BRAND B-B FEEDS

24% Dairy Ration, 20% Hi-Test, 16% Marmico. A protein content suitable for every grade of roughage.

BULL BRAND B-B FEEDS

24% Dairy Ration, 20% Hi-Test, 16% Marmico. A protein content suitable for every grade of roughage.

BULL BRAND B-B FEEDS

24% Dairy Ration, 20% Hi-Test, 16% Marmico. A protein content suitable for every grade of roughage.

BULL BRAND B-B FEEDS

Uncle Charlie says.

To convince yourself that BULL BRAND gets more eggs for less money... Make this test

CHARLES PIKE of Spring City, Pa. heard so much about the results poultrymen were getting with Bull Brand Feeds that he decided to try them. But, like all successful poultrymen, he didn't want any guessing — he had to have facts and figures.

How B-B Won The Test

So he divided a test flock into three pens of 50 hens each. One of these was fed what he thought at that time was the best commercial feed, another got a home mix, while the third was put on Bull Brand. When the test was over, B-B led the contest by 80 eggs. Then Mr. Pike put the pen with the poorest record on B-B, and they quickly caught up with the winners.

Year after year B-B poultry feeds go on rolling up records for more eggs... sturdier and more active birds. "I have fed B-B Laying Mash to my 124 hens and I got as many as 97 eggs a day during November. B-B is absolutely the best feed I have ever used," writes M. Alvater, Brooklyn, Md. "I consider

B-B safe and economical. June pullets are laying 63% in coldest weather. My hens took first prize for best laying condition at the Fairs last fall," reports H. P. Birden, Barkhamstead, Conn.

Only by making a test yourself will you know what B-B feeds can do for you. Get enough B-B Laying Mash, vitaminized with Cod Liver Oil, and B-B Scratch Feed to last one pen 30 days. Write to me if your dealer can't supply you. At the end of the test period compare the egg production, the size and shell of the eggs, the condition of the birds, and the feeding cost. If B-B doesn't come through, take the empty bags back to your dealer and he'll return your money without question.

"The Story of Old Slim"

BILL lit up his pipe for a few good pulls before beginning the story of Old Slim. Short, red flames, like hungry wolves' tongues, licked the logs as Bill blew out slow clouds of dense smoke. Old Bill has a wonderful way of making you see things. The group around the fire could almost hear a wolf howl in the wind's moan in the stone chimney.

"I'll just only tell you about a little incident to give you an idea what sort of endurance that dog had, boys," said Bill when he was ready to resume.

"Of course, I never found out how long Old Slim could run. It was like the case of Bill Harkinson's old maid sister who allus said you never could have told how many children she would have had if she'd got married. But I'm agoin' to tell you about his last chase, boys, th' one time in his life when he really cut loose with the best he had an' ran. This ain't a story of endurance, though th' chase lasted quite a spell; it's just a simple, straight forward account of what that dog could do in the way of runnin', give to you straight without no exaggerations or nothin', but what I can recollect perfectly plain as if it was yesterday it happened.

A Rabbit with a Reputation

"Boys, you've all hunted th' white rabbit we have around these parts, them that's white in the winter an' brown in summer, an' you know they kin run. They're first cousin of th' jackrabbit on its mother-in-law's side an' I'll say th' common ordinary 'run of 'em kin clip along about as fast as a Kansas jackrabbit, for I've hunted both kinds.

"But they's freaks in every line, boys, an' one year—th' last year I had Old Slim, it was—they was one big buck rabbit in these parts that was twice as big as the white rabbits commonly grow. I'd tracked him an' hunted him an' put more'n one load of shot after him, but say, he could go like a bat out of hades an' I'll declare he just appeared to run right away from th' shot. I kept hearing about him right along an' one day it come to me, 'Why not start Old Slim for a little go with Mr. Jack?' An' I made up my mind right there that that big rabbit was my meat, an' I'd carry his left hind foot on th' string of my powder horn.

"Well, sir, boys, you wouldn't believe th' particular trouble I took gettin' that dog in shape for th' chase. I'd told a few folks about my intentions an' they was all cooked for that rabbit chase. Most of 'em thought Old Slim would catch the rabbit, but all of 'em hoped he wouldn't, because he wasn't their dog, see. That's another peculiar trait in human nature, boys; it takes a big man to enjoy seein' another succeed, if they'd only admit it.

Intensive Training

"For a hull month, boys, I turned that dog an' worked with him same as they do a thousand-dollar race horse. Every night I rubbed him down an' bandaged his legs after workin' him out a little in the fields on cottontail rabbits. I fed him nothing but lean meat an' bones an' a little corn cake. An' to'rds th' last I give him a teaspoonful of gunpowder wunst a day to put th' ginger in him. An' say, boys, it put it into him all right!

"When I'd lead him out to train him, he'd be right up on th' collar an' tug-gin', and both front feet beatin' th' air like he was swimmin'. Boys, it was just like hangin' on to a skyrocket. When I'd leave him go he'd jump twenty feet th' first crack an' be gone in a couple of leaps. He felt so over powerin' good he had to run, an' he'd circle around ten miles or so before he'd bother with any cottontails.

"He was a mighty intelligent dog, Old Slim was. He knowed I was gettin' him in trim fer somethin'. Well, sir, boys, when a month was up he

was just right. He wasn't carryin' an ounce of fat an' no more meat than just what he needed for a hard chase. His muscle stood out in cords; he was like a skinned frog. Boys, he looked like a mile-a-minute an' then some. I'd backed him in a race ag'in anythin' that wore hair.

Off Like a Rocket

"Well, sir, boys, when th' day come fer that big rabbit chase they was as many as forty people on hand to see the fun. Of course they all knowed Old Slim's reputation an' they knowed that big buck rabbit's reputation, too. That rabbit was known from Lake Erie to th' mouth of French creek an' north to Bear Lake. He'd got to be sort of a by-word fer speed. If a horse was a fast goer folks would say, 'He can go like that big rabbit up in Bill Trimm's country.'

"Say, it was a wonderful day for a chase, no wind an' th' air just cool enough to be right. I untied Old Slim an' he most dragged me out of th' barnyard to'rds th' flats. Th' boys had been bettin' on th' chase, but when they seen him th' jackrabbit backers quit. You couldn't git as much as one to ten on th' dern rabbit.

"Well, th' crowd follered me down across th' flats to th' place where I cal'lated we'd jump th' big buck. When everything was ready I slipped th' collar an' away went Old Slim—wh-s-s-s-s-h—like a rocket that's fell over an' shot along th' ground. An' as luck would have it he jumped th' big rabbit in plain view of th' hull crowd an' away they went.

"Old Slim let out one beller an' opened up like I'd never seen him before. Boys, boys, it was grand! It was champagne agin champagne—one of 'em runnin' fer his life an' tother fer his reputation. Th' chase led right off around Powder Mountain—you all

know that country, boys, it's just five mile around th' mountain. I knowed that big rabbit would circle it an' he'd figger he'd leave Old Slim afore he got around th' first time.

Ideal Setting for a Race

"Gosh, that chase couldn't a been staged better if it had been on a race-track, an' us a sittin' on the grandstand. Th' men set around on stumps an' logs—those of 'em who wasn't so excited they couldn't set down.

"I'd timed th' start, for I knowed how th' chase would lead off. I wanted to see how long it took 'em to do th' five mile round th' mountain. It were exactly 3:20 when Slim jumped th' big jack an' it were 3:23 th' first time they come around and whizzed past us. If any of you boys got a pencil you can figger out their time on a mile—I can't do it in my head. To make sure I'd timed them right I held the watch on 'em agin, an' on th' second lap they made it in ten seconds less; you see they was warm'n' up an' doin' better right along.

"Oh, boys, boys, them was two thoroughbreds, that big Jack an' Old Slim. A feller's got to take off his hat to both of them. It ain't every day, ner every century, that kin produce a dog an' a jackrabbit like that pair.

Crowd Goes Wild

"Did you ever hear a woman tearin' up sheets to make rag carpet? That's what it sounded like when they came around th' mountain—just one long 'rrriippippi' with a sort of whistle tacked on, like a fisherman castin' his tin minnow away out fer bass. Every time they passed us th' crowd just went crazy an' hollered their fool heads off until it echoed clear across to Panther Holler, a mile an' a half. They keep a goin' faster

and faster an' by th' time they made about ten trips around the mountain they was travelin' faster than sound. You'd hear 'em whizz past like a hull mile of bed sheets a tearin' an' in a few seconds you'd hear Old Slim bark, which he'd let out two miles behind, comin' roarin' along after him; but not able to catch up.

"Boys, you could imagine th' excitement of that crowd a watchin' th' chase, or I mean to say listenin' to th' men fellers was clear wild. I kept a wishin' I could get a look at Old Slim to see if he was sweatin' very much, an' I wished I could see how fer that big buck rabbit was ahead of him.

"'Couldn't you see 'em when they come a-past, Bill?' some one asked. 'See 'em?' Why you poor darn fool—we hadn't been able to see 'em from th' first. They come right close past us in open ground every time they made the circuit, but we couldn't see 'em—they was travelin' too fast! You couldn't catch sight of them no more than you kin th' bullet out of a gun.

A Proud Moment

"Well, sir, boys, they kep' a-circulin' that five-mile route fer an hour steady. We could tell by listenin' close that Old Slim was gainin'. We knowed it because they'd made a kind of double sound at first, 'whizz—whizz,' but now they was close up so it was just one 'whizzzzzzzz' as they went. Then all at wunst we heard that big jackrabbit squeal an' we knowed Old Slim had got him. A rabbit will squeal awful loud one time when he's caught, but he just gives one squeal an' he's through whether he's killed right there or not; you ask any old hunter.

"I knowed Slim had him though he didn't stop on that round. 'Never you mind folks,' I says to the crowd. 'He's got to make another trip around the mountain to get slowed down. He's carryin' the jack with him an' he'll stop next time all right.' An' sure enough, boys, he did, an' it was just as I'd told 'em—Old Slim came lopin' in with Mr. Jackrabbit in his mouth.

"Th' chase had lasted two hours an' as near as we could recollect they'd made seventy-five trips around th' mountain, five mile to a trip—you can figger th' distance fer yourself. He stopped in front of me and layed him down. Boys, I was the proudest gent in twenty states at that periculiar moment."

The Fatal End

Bill sat gazing in the glowing red bloom of the fire seemingly tired with the feeling of a terrific tale. A real tear stole down his brown, old nose and sparkled on his gray mustache.

"Boys," he said, "I hate to tell you th' end of that there chase. It most broke my heart at th' time an' just thinkin' of it bothers me now. It was th' wind-up fer poor Old Slim, th' best dang dog th' good Lord ever put breath into. When he came up to me an' laid down that big jack 'most as big as he was—I smelled somethin' scorehin' an' I see right off th' poor dog was 'most burned to death. Yes, sir, boys every hair on his hide was scorched off, an' his ears, an' tail was charred like charcoal.

"You see, boys, he'd run so fast th' friction of th' air had done it, heated him up like it heats a high power bullet. He just only lasted till the next day an' died. It about killed me too.

"An' that there jackrabbit was cooked—yes, sir, cooked so complete we never needed to parboil him. Th' woman dressed him an' heated him over ag'in fer a stew, though it were hardly necessary to cook him no more. But I couldn't eat none of him. I was feelin' too bad about Old Slim, an' anyhow that jackrabbit was too good a sport to eat. Him an' old Slim had both ought to have statues set up for them."

John B. Shank

Franklin County, Pa.

"Varmints"

IN an article some weeks ago Mr. Agee spoke on the insect menace, which I believe could be compared with the rodents and such animals as rats, skunks, minks and weasels, which are always ready to undermine a man's efforts to house and feed himself and his family and livestock by honest means.

These pests spend only a portion of their hours catching their prey and the balance is spent plotting and scheming how and which would be the best and most certain way to take the advantage and get their designs accomplished. The law of the land is none too severe on perpetrators of this menace.

The extra care we must take of the stock, such as bedding, hauling ma-

Plenty to Do

THE winter months are with us again, the time of the year that city folks refer to the farmer as being housed in with nothing to do. This statement of course is far from the truth, for no successful farmer idles many precious hours away. There are in reality many very important jobs to be done in the winter, as every agriculturist knows. Neglect of these small things, in the cold months, goes a long way in making farming a failure.

Leaky roofs on the house or out-buildings soon cause a heavy loss in damage to the building and its contents. The drainage of the fields is an excellent occupation when the ground is not frozen. Poor drainage of the fields is a sure sign of a crop failure. Even when the ground is real wet ditch digging is a paying job.

The stumps we see in so many fields offer an excellent occupation on cold days. A few sticks of dynamite and a pry and we have rid the farm of a nuisance. The ground reclaimed, aside from the time and labor saved in cultivation, pays many times for the cost of dynamite and labor.

Stones—have you ever considered how much they reduce the crop? Besides making cultivation easier and faster the ground reclaimed by removal of stones is tremendous. The stones themselves have many good uses for the farmer, mainly cement work or filling ruts in lanes.

Cleaning fence rows, building good strong fences, although often neglected, we all know are very important.

The washing and greasing of harness the oiling and repainting of all farm implements calls our attention on wintry days.

The extra care we must take of the stock, such as bedding, hauling ma-

nure, regular feeding, and the water lines to keep thawed out, all if properly done cut heavily into the short winter days.

The pruning of trees, grape vines and shrubbery must be done in the closing days of winter. Odd jobs such as butchering, hauling coal, with the many numerous tasks around the house, help to keep you very busy in the winter. For no matter how hard you work there is always something more to do. Many times it is not a question of finding work but what is most important to do.

Taken all together, the farmer has many important tasks to do in the winter, and to neglect them points to one final ending—failure.

—George A. Frye

A Place for Everything

ONCE visited a prominent farmer who had a place for everything. Over the brow of the hill in his pasture, out of sight from his farmstead were all the things that so often clutter up a farm and make it unsightly. There was the pile of reserve posts; hard by and neatly stacked were the fence rails; at the same place was a wood pile of junk wood always due right there when torn out of fences, buildings, orchard limbs; abandoned farming implements stood in a row at hand for repair parts and emergency irons. The hundred and one things that might have disfigured his farm were right there, out of sight, but handy for use.

Yesterday I attended a farm sale on a road that I had never traveled. The whole place presented such a topsy-turvy appearance that it seemed as if a sale were a blessing. It looked as if life in such surroundings must have been dreary. Here was an old cob-sled settled down in the mud not used for years; a wind-swept and tattered old buggy still stood its ground in a prominent place; orchard trees dead and toppled over nurtured an abundant crop of burdock brons; old papers and rusty cans, waste irons of all kinds and refuse straps, worn-out brooms, ramshackle chicken coops, useless battered baskets and crates and a hundred amusing bottles greeted the eye wherever one turned. Old half-rotten boards, pickets, pieces of fence rails and dilapidated farming implements littered the whole place.

Mr. Agee several years ago suggested in this paper that the faculty to destroy should be cultivated. What of the ash pile over the back fence; what of the tin cans; what of the brush piles; what of the crumbling shacks and junked implements; what of the rotten rails and posts—what of the hundred disfiguring but absolutely useless articles that insult the eye on so many farms? Substantial improvements on the farm suggest ample buildings, etc., but the cheapest and most substantial improvement is a sharp and industrious clean-up.

Whether rich or poor, owner or tenant or farm hand we can all have clean looking places. They react on our morale; they encourage and compel us; they go far toward establishing a man's character in his community. People believe in that sort of stuff and it gets one further. Living in a maze of trash and junk and "trumpery" is pathetic—pathetic, I repeat, because so entirely unnecessary.

—H. D.

Easy Tree Pulling

IN one of the fields of the farm I bought some years ago, to add to the old homestead farm, was a very

Farm and Town Wages

IN answer to "A Sod Buster," who wrote in December 14th paper, I think the working man and the farmer are not getting justice, but Mr. Buster's letter does not hold good in central Pennsylvania.

I lived in Harrisburg from 1919 to 1923 and averaged over \$150 a month, but paid \$40 to \$45 rent for an ordinary house.

Worked as tenant on farm at \$50 cash per month, had a fine house, five minutes to train, and concrete road, etc. Got anything I could raise and use myself, use of milk and butter, got the meat of two pigs, one-third of all eggs and increase of chickens. No feed to buy of any kind. Made over \$300 on the side in cash besides increase on eggs and chickens in one year, and figured I had as much if not more than I had in town. And take it from me, I did not work an average of over eight hours per day.

I think that place is a fair average of this district, although I know of only five or six farms at any time having a man and family working at

What Our Readers Say

large mulberry tree in a corner about twenty feet in from both fence lines. The tree was a triple tree. Three trees were growing up and united at the base—the roots.

This tree, or rather its removal, was a problem. Sawing down three trees at once is a thing which I will never try. I have even given up trying to saw down two trees at one and the same time. Why? It simply can't be done. The saw sticks. Cutting it down with the ax would leave a large stump. There will be no more stumps for me either. Six times we bent the end of the binder knife so badly by driving against stumps standing out a little from the fence lines that it was got out and straightened with the greatest difficulty. Other implements suffered. Stumps are a nuisance in worked fields.

Early this fall I thought of the right way. It is ridiculously easy and simple. Here is the plan: I dug away the ground around the tree about twenty inches deep, cut off all the roots I met—and I met plenty, but a sharp ax cuts green roots almost like cheese—and then I quit right there and then.

A few weeks later along came the equinoctial storms with their accompanying downpours and one morning one of the family said to me: "The tree is down." It went down so easy, too, that not a limb or a stick was broken. The handle of the pick used in digging left at the tree's side was caught, but the ton weight resting on it didn't faze it either. "As for me, give me the liberty" to get rid of useless, hindersome trees in this way; others may work themselves to "death."

—R. I. Weigley

Potato Futures

EDITOR, Pennsylvania Farmer: I hope some time to meet you, having known many editors of farm and trade papers and having had much pleasure from discussing farm problems with them. At the same time I rather expect to find that we take more time in disagreeing about something that comes up in the talk than we do in agreeing, for we are both men who resolutely think for ourselves.

However, we thoroughly agree on your editorial about speculation in farm products. Many people want to end speculation, or say so, when what they really want is for no one to make any money out of a particular ar-

ticle or product except themselves. This is impossible in the case of nearly all farm products, for as in the case of potatoes the period of consumption is much longer than the period in which they are being harvested for market. Some one obviously must bear all the risks and expenses of storing each farm product till the consumer wants it.

In the case of potatoes the late or main crop is much cheaper to produce per bushel than the early crop. Through the spring months the consumer has the option of eating either the new potatoes from the Far South or old potatoes kept through the winter from the previous year's crop.

My records show that in the past five years the average number of carloads of old crop potatoes shipped after April 1st has been 31,292, including imports from Canada, while the average number of cars of new crop shipped in the months of April and May has been 12,149. When we remember that practically all the new crop goes to market by rail while more than half of the old crop is either consumed on the farm or sold by wagon or truck it is plain that four to five times as many old potato-

atoes are consumed in the spring months as of new.

Some one must own all these old potatoes from the time they are harvested in October or November till they are used, practically six months. Whoever does so must be a speculator, whether he wishes to be or not. No one can foretell what the spring market will be, for it depends on a number of factors. Any consumer who wishes can insure himself against loss by a rising price by buying in the fall, and some of the worst kicking I have ever heard has been by consumers who bought 15 bushels in the fall and saw the price fall in the spring.

One of the greatest needs of the potato business is a potato exchange on which the grower can sell his crop at any time for future delivery. Unfortunately, the natural variation between potatoes grown under different conditions is so great that it has been found to be impracticable to fix standards which shall be effective. The present U. S. grades are a working substitute of great value.

When you want to think a little for yourself, get the statements of European financiers on the present situation here and see the difference between the intelligent man and the vast number of educated men who are now learning their thinks from Wall Street and Washington. And just for one minute imagine any labor union representatives who should express themselves as being heartily in accord with a program for raising the price of food.

Daniel Dean.

What Shall We Raise?

WE are all interested in making our farms pay better. For the past few years our farms did not pay big dividends. That is the average farm. I cannot forget the much good advice that the late Mr. W. W. Reynolds of Ohio gave us. He used to preach to us to cut down in our production, let more land lie in grass for hay or pasture and take it more easy on the farm. Soon our produce would bring a living price.

I think that after all the law of supply and demand is the only real price maker. Many think that our "farm bloc" in Washington can help the farmers, and undoubtedly it can, but the real thing has to be done by the farmers themselves.

Farming is a business like anything else. It takes brains to farm these days. We have to study and learn and experiment. We have to cut out such crops and such methods as do not pay. I think I have found a new crop that will pay. I intend to plant ten acres to broomcorn next year. I intend to plant 100 acres in corn. I raise quite a few pigs and with corn I can fatten them. I can do all this very economically with the tractor and the two-row cultivator. This works so well that it is a real pleasure.

Meat Products Retailed

We have to be in love with our work if we wish to succeed. I enjoy myself on the farm. I do not look forward to the time that I will retire. I intend to stay on the farm at my occupation as long as I can work.

I might simplify the work much more. At present we do butchering once a week and sell fresh and smoked meats from a stall in the market house. We cure all the hams and smoke them in the old-fashioned way and sell them at 40 cents a pound. We cut up the shoulders fresh, spare-ribs 28 cents, back bone 22 cents, tenderloin 48 cents, rendered lard 16 cents, fresh sausages in hog casings 27 cents, smoked 29 cents. These sausages we make from half pork and half beef.

Then we make another kind of one-third pork and two-thirds beef, put in the hog bladders and the half wide beef casings. These we smoke and sell at 32 cents. The puddings are made of the liver, hog skins, meats cooked from the pigs' heads and bones of the

beef. For this we get 25 cents.

We have so arranged our fields that we plow only the best soil. Fields that are wet and not profitable for rotation of crops we put in grass for either hay or pasture. Some we planted to timber trees, such as white pine, Scotch pine and Norway spruce. Some farmers have some fields that lose them money every time they plow them for a crop.

I do not like to see fences except at the pastures or where they are needed. We have our pastures fenced in fields so that we can transfer animals from one to the other, which is better than for them to run over everything to tramp it down.

A Permanent Pasture

Our Kentucky bluegrass is showing itself pretty well by this time. By spring it will be four years since we started our 30 acres of permanent pasture. The soil was poor. We had it in corn the year previous. Then limed it with 50 bushels of fresh burned stone lime to the acre. In May we prepared a very fine seed bed and sowed heavily with a mixture of timothy, redtop, sweet clover, Dutch clover, alsike, red clover and the biggest amount of Kentucky bluegrass, with three pecks of oats as a nurse crop, 300 pounds good grade fertilizer to the acre.

The season was a good one and the growth was wonderful. We cut the oats when it was headed out and let it lie. This was a good mulch for the young grass during the hot weather and the result was very gratifying.

The following year the sweet clover and redtop were very prominent and almost discouraged me, as I did not see much Kentucky bluegrass. But it is getting very prominent now. I have learned that it takes time to establish this very valuable crop.

I also made a mistake in using too much of a mixture. Better not use redtop but more Kentucky bluegrass. It will not take so long for the bluegrass to become established.

How proud I am of this bluegrass! This will be sweet to our young cattle. We buy dairy calves, either male or female, and raise till two years old when we sell them. I would rather buy beef calves, but they are not to be found around here.

Berks county, Pa. C. R. Bashore.

Sixth Horticulture Week at State College

THE Sixth Annual Horticulture Week at State College, December 9-11, attracted fruit growers from twenty-three counties, Adams county leading with ten. About twenty-five per cent of those in attendance came nearly every year, showing that these gatherings are meeting the avowed purpose—"to keep posted on progress in horticulture," to some extent at least. A booklet review of recent developments, entitled "What Is New in Horticulture?" is distributed.

Homer C. Price, a fruit grower of Newark, Ohio, reported that dusting is gaining in favor in Ohio, replacing spraying in some orchards, and supplementing spraying in others. Either method, he said, gives satisfactory results in Ohio if done right. He finds the cost of twelve applications of dust and six of sprays to be approximately the same, with equivalent results. In the last two years a mixture of superfine dry lime-sulphur with commercial sulphur dust, 85 parts to 15, has given better control of scab than sulphur dust alone.

Stationary Spray Plants

The stationary spray plant has been successful in Ohio. Mr. Price predicts that within a few years most of the fruit growers who prefer spray to dust will install stationary plants. He is an advocate of very low heads and low lying limbs for apple trees, not only because of convenience in spraying, harvesting and pruning, but also because the branches shade the ground beneath the trees so that there is no grass there; then if a fire starts in a sod orchard of such trees it may burn off the middles but will not reach the trees.

Mr. Price sells most of his fruit at the farm. He finds that conspicuous arrows, pointing the way to the farm, are more serviceable, and much less expensive, than elaborate roadside signs. He charges the wholesale price at the packing house (not the roadside market) rather than the retail price and finds that this can be stressed in his advertising to advantage. Most Pennsylvania growers, however, charge "all the traffic will stand" at the farm; this is nearer the retail than the wholesale price.

Six Days to Sell

Sunday selling, in the judgment of this Ohio grower, should be discouraged, not only because of religious scruples but also because the fruit grower puts in six strenuous days a week and needs the seventh for rest. "It is an imposition on the fruit grower," said Mr. Price, "to expect him to work seven days a week; you can't get a hair cut on Sunday and most other business men take a rest—why should we be the exception to the rule?"

Stewart Bear, of Scotland, Franklin county, reported heavy loss this season in that section from the second brood of codling moth. Much of the trouble, he says, may be traced to nearby unsprayed orchards. He wonders how long it will be before we shall have in Pennsylvania, in the more intensive fruit growing districts at least, compulsory spraying of neglected orchards. If this has been found necessary in the Pacific states, for the protection of progressive fruit growers, why not here he asks.

Paid to Spray

F. N. Fagan, of State College, reported that there were four freezes (ice formed) and also five heavy frosts during the protracted blossoming season in the College orchard last spring. There were white frosts on several mornings when he was trying to put on sprays. Yet this orchard had a fair crop. One of the reasons was

that the spraying program was carried out just the same. A good many growers, feeling sure that no fruit could possibly pull through such weather, either abandoned or curtailed their spraying program. That was a mistake; these men might have had a fair crop if they had kept to the usual schedule.

Professor Fagan stressed the importance of tree vigor resulting from successive years of good care. It enables the tree to resist unfavorable weather conditions, to some extent; vitality counts. One block of Stayman in the College orchard averaged five and one-half bushels a tree, another block two and one-half bushels. The difference was due, apparently, to the cumulative effect of care in preceding years. Confirming this statement, several growers reported that they had a good crop of Stayman only on trees that stood in low, rich spots in the orchard and were exceptionally well nourished. This variety apparently becomes less certain in production as the trees get older, and requires heavy fertilizing. The problem of the unproductive Stayman orchard is one of nutrition as well as pollination.

Poison Baits for Mice

R. D. Anthony, of State College, emphasizing the paramount importance of maintaining the organic matter content of the orchard soil, called attention to the practice in southern

California. According to H. J. Wilder, county agent of San Bernardino county, California, who was a recent visitor at the College, the citrus growers of that district are finding that they cannot possibly grow enough cover crop in their closely planted orchards to maintain the organic content of the soils, especially as the trees grow older. So they have resorted to spreading alfalfa hay over the soil and chopping it under. It costs about \$12 a ton and two or three tons may be applied annually.

W. W. Livingood, of Robesonia, has had excellent results from using tin cans, salvaged at the town dump, as poison stations for mice. He does not remove the bottom, but merely makes a dent in one side, to hold the bait. Second-grade or cull half-pint milk bottles, costing about one cent each, also make satisfactory stations. Several growers merely place pieces of boards around the orchard; the mice burrow beneath this cover and this is the place to put the poisoned bait. In his judgment, the opportunity to purchase poisoned bait from the federal government (Bureau of Biological Survey) will greatly simulate its use; fruit growers can prepare poison bait on the farm but few care to do so.

Any Pennsylvania fruit grower whose orchard failed to "hit" this year, and who feels somewhat down in the mouth thereby, is advised by our Ohio friend, Homer C. Price, to take an inventory on January first, as follows: put down first the crop you are going to have next year, and what it will be worth. Then count the number of trees you have and assign a good round value to each. Add the two sums. You will feel like a millionaire.

S. W. F.

Garden and Truck Crops

By GILBERT S. WATTS

LISTEN to this! Tuesday afternoon, January 21st, a real marketing session with talks scheduled from four growers, a Bureau of Markets man, a commission merchant and a chain store man. And at 5:30 a banquet in the Odd Fellows Temple, plate about \$1.50. Banquet address by Mr. Henry G. Marquart of Orchard Park, N. Y., a grower and president of the Vegetable Growers' Association of America.

First thing Wednesday morning will be a period for the answering of questions on insects, diseases and culture with specialists in each line on the floor. Then Dr. Mack of State College will discuss vegetable varieties and C. H. Nissley of New Jersey will tell of the most advanced plant growing methods.

Wednesday afternoon will be devoted to fertility problems. Leading growers will tell how they fertilize. A member of the vegetable department at State College will consider high analysis fertilizers. And a review will be presented outlining what the various experiment stations have found about feeding vegetable crops. Few commercial vegetable growers can afford to miss this opportunity. In addition there is a competitive vegetable exhibit that is open to all. Complete program and premium list may be secured from State Farm Products Show Commission, Harrisburg, Pa.

If you are a vegetable grower, or grow plants to sell, secure a copy of Bulletin No. 214, "Containers for Plant Growing," obtainable from the Pennsylvania State College, State College, Pa. This publication presents new and original material, the results of research with which every plant grower should be familiar.

WITH the swift advances that are being made in the design and manufacture of farm machinery it is a grave responsibility to make sure that one is buying the very best ob-

tainable when making replacements or adding a new machine to the farm's equipment. I know of no better place to work out this problem than on the commercial exhibit floors at the Farm Products Show in Harrisburg. There many makes of the same machine may be compared in detail.

I always have found it an education and a pleasure to spend a liberal amount of time in the machinery exhibit and in talking with the representatives of the several manufacturers. Much is to be learned from these field men who travel and have opportunities to see how operating problems are being worked out in different sections of the country.

THE last of the Old Year is a proper time for recalling and taking to heart the observations and lessons of the past in working out sound plans for the future. Let's look back over our 1929 gardening operations. But this is going to be onerous. If you met with unusual or significant garden experiences please write us in care of Garden and Truck Crops column. We always are glad to receive letters from readers and publish those of general interest; as well as to answer inquiries or refer them to authorities.

AT the beginning of the season there was the leaf lettuce. In my experience it enjoyed just a little less demand than in 1928 and much less than five or six years ago. This is a crop of which it is easy to plant too much. Almost every home and market gardener plants more than necessary. Besides the fast increasing consumption of western "Iceberg" lettuce is having a serious effect. It now is on the market every month in the year. In the five years from 1924 to 1928, inclusive, shipments have increased from 23,000 carloads to over 46,000 carloads. Still many people enjoy some leaf lettuce in the spring. It is our duty to see that they get it

crisp, tender, not overmature, of the highest possible quality.

FOR those who have not tried it, the "Iceberg" lettuce of the grocery store is the New York of the seed catalogues. Best results usually are secured from the first crop in the spring, but in our humid climate with uneven temperatures failure to obtain a large percentage of marketable heads is very common. Thin to a liberal spacing, at least 12 to 16 inches, and do not fertilize too heavily if the soil is very rich.

WE cannot pass over the very dry past summer without paying tribute to the part the overhead irrigation system had in making it one of our best years. The celery, summer and fall lettuce, spinach, beans and late root crops for bunching would have been a sad case without artificial watering.

THE year of 1929 also marks the giving up of the manure supply we have secured from a National Guard cavalry unit for a number of years. A rash decision? Experience indicates not. Some of our fields were too poor to grow satisfactory oats and wheat eight years ago and have now been brought to a state of profitable truck crop production with green manures, commercial fertilizers and lime alone. And oh, how it costs to haul and distribute manure and the weeds that come along.

THE most significant mechanical innovation on Logan Spring Farm in 1929 was a 15-h. p. crawler type tractor. It has proved thoroughly satisfactory in every respect and we must admit shows great adaptability to a wide variety of work and all sorts of operating conditions. It plowed, harrowed, drilled, limed, fertilized and hauled loaded trucks of winter cabbage out of a field that became so swampy it was a sin to take horses into it the last days of October.

A FIT running mate for this tractor was the two-bottom, 18-inch corn-borer plow that was purchased at the same time. You need plow no deeper than with an ordinary plow and it wades right through tomato vines, standing corn, tangled green manures or what have you without annoyance or delay.

INCIDENTALLY this tractor finished a season of severe work without a cent for repairs. At the same time my car rounded out three years of service, all but 31,000 miles, before it became necessary to make the first repair, a minor one. More and more I am convinced that nearly all of the trouble and breakdowns experienced with the better class of farm equipment and motors arises from faulty operation or inadequate maintenance particularly lubrication.

Dry Spraying

Will you inform me the best material for dry spraying or dusting? H. F. N.

THE best materials for this purpose have still to be determined. Dusting is yet in the experimental stage. While progress is being made by our experimenters, it will probably be some years before they are ready to make standard recommendations to the commercial growers of apples and potatoes, though the sulphur-arsenate dusts now have a place in the regular peach orchard schedule.

On potatoes, the copper-lime dusts (monohydrated copper sulphate and hydrated lime) are being listed extensively with seemingly promising results. On apples the most commonly used dusts are the 80-10-10 or the 90-10, the first being a mixture of sulphur, hydrated lime and arsenate of lead and the second containing only the sulphur and the lime. The Ohio Experiment Station reports that the sulphur dusts seem to be improved by adding 10 to 15 per cent of fine ground dry lime sulphur.

Farm Practice

By W. D. ZINN

Mouldy Silage

My silage has mouldy spots in it. I did not tramp it, but once in a while I leveled it down. What caused it to mould?

Could I sow vetch in my wheat in the spring and cut both for hay? At what stage should wheat be cut for hay? J. B. Tucker.

If the silage was kept level there must have been some one in while the silo was being filled, and that was what caused the mouldy spots in the silage. That one stood on the silage until his feet sank down in it. When he lifted his feet to make another step a pocket of air was enclosed as the silage rolled in to fill the hole, and that air thus enclosed caused the silage to mould.

We filled two silos for four years in succession and did not lose a bushel by being moulded after the top was taken off, but we had no one in the silos while they were being filled. We let the silage fall to the center of the silo and automatically roll down as it fell. I have no hesitancy in recommending that method of filling silos.

I hardly think the vetch would make growth enough to pay for the seed if it is sown in the spring in the wheat. If the wheat is cut for hay, vetch is an annual and should be sown in July or August if the best results are desired.

Big Corn Yields

A FEW years ago the writer referred to the fact that a Mr. Gilmore of Licking county, Ohio, had grown 134 bushels of corn on an acre of ground. A few weeks after this was published I received a letter from a farmer in a county adjoining Licking county asking me if I believed such a story. This farmer wrote that he had better corn land than Mr. Gilmore and he had never been able to produce so much corn, neither did he believe Mr. Gilmore grew it.

Now we have a report from Ira C. Marshall, Hardin county, O., in which it is stated he grew 170.4 bushels of corn on ten acres. This is an average of a little over 170 bushels per acre. It should be remembered that this was shelled corn. Wonder what my Ohio critic will say about this report.

I was in Mr. Marshall's community last year and while I heard many commendings him on his ability to grow corn I did hear a few who said they did not believe the corn was grown. There is nothing truer than that a prophet is never without honor save in his own country. I do not have any doubt as to the correctness of this report.

Various Questions

I have a timothy seed I wish to put in corn next spring. This is a clay soil. Some of it is "chanery" soil. I will not have enough manure to cover this field and would like to know how much and what kind of fertilizer to use. Would like a mixed goods.

I wish to apply some phosphate to my wheat in the spring and was thinking of using nitrate of soda. Would it pay to do this or could I add some potash and superphosphate to this and get better results?

I have heard some say you could get better results from the manure if applied to soil a year ahead, that is, the spring before you wish to plow the field. What is your idea on this? How much flax seed should be sown per acre when cut for the seed?

I SUPPOSE the word "chanery" is a local name used for a certain kind of a soil, but it is a new one on me. Webster fails to tell me the meaning of the word, so that part of our correspondent's letter must go unanswered.

Too many of our readers get the idea if they have manure they need no commercial fertilizer. I do not remember that I ever applied a ton of manure that was not reinforced with superphosphate. The reason was that manure is rich in nitrogen and potash and short on phosphoric acid. Our correspondent could do no better than to apply from 300 to 400 pounds of superphosphate all over the ground

and then put 150 pounds of a 4-16-4 goods in the hill or row. I mean, of course, that much per acre.

At some of our stations the application of nitrate of soda has increased the yield of wheat by ten bushels per acre. Much will depend on the fertility of the land, of course. If the land has been heavily manured and has been growing legumes for several years I doubt whether the application of nitrate of soda would pay, but no matter how fertile the land I found that the application of superphosphate paid in securing a stand of clover in the wheat even if it did not benefit the wheat so much.

The application of potash may or may not pay. Our correspondent will know more than I can tell him about potash on his land after he has asked the land whether it will give him a return on an investment of potash. He can do this by applying potash in strips on his farm.

Woodbine Farm never paid for the application of potash except on potatoes and there it gave a 33 per cent increase. The reason for this was that the liquid manure was saved religiously, but potatoes being a quick growing crop and also a heavy feeder of potash could not get enough potash to supply their need. On Woodbine Farm the manure went on the newly seeded meadows first. That gave us a heavy sod to turn down, but that never failed to bring the corn, but this manure was reinforced with superphosphate.

When I was an eight-year-old boy my father grew flax on the farm for the fiber. I do not remember how much seed was sown per acre, but authorities say that for seed from two to three pecks per acre should be sown, but for the fiber from six to eight pecks.

Improvement of Pastures

Would like to hear how to improve pasture land without plowing. I saw in one paper last spring where some farmers in Ohio had used lime and phosphate and sweet clover. Have lost the paper. A. T. Mc.

UNTIL recent years our experiment stations had made no investigations in regard to the improvement of pastures. The idea seemed to prevail that because pasture land was not plowed it would not become exhausted of plant food.

The land is becoming in need of lime more and more each year due to the leaching of lime in the subsoil. All animals grown on the land are carrying away in their bones some lime and a quantity of phosphorus. This operation has been going on for more than a half century on many fields and the land has become short on these elements of plant food. The necessary treatment is very evident, the application of these things to the land.

The writer has always recommended the harrowing of the land and reseeded with timothy, redtop, orchard grass and red and alsike clover and the application of lime and two hundred pounds of superphosphate per acre, but the Ohio Extension Department has received marvelous results by applying two tons of ground limestone and 40 pounds superphosphate per acre. The ground was not harrowed, neither was any seed sown. The increase from this kind of treatment was over 400 per cent. Pennsylvania, Ohio and West Virginia Experiment Stations all recommend similar treatment of pasture lands and in each state the results have been very satisfactory and profitable.

There is scarcely any subject connected with farming that is of greater importance to farmers than that of improving their pastures. On most farms are many acres of grazing land that are not producing more than one-fourth they are capable of producing. It would not cost the farmers much to try this on a few acres.

Buy Your Fruit Trees Direct from Green's at Growers Prices

For over half a century we have been growing fruit trees and selling them direct to the planter. We have no agents—you save half. Hundreds of profitable Pennsylvania orchards bear witness to the reliability and quality of our stock.

Green-grown Products are True-to-Name Strong—Vigorous—Healthy—Insure Satisfaction

You can't get results with weak, unhealthy trees and plants. The most careful attention is given our trees in their early life—cultivation—fertilizing—spraying—by experts—trained by Charles A. Green, a national authority on fruit growing. This special care produces superior stock. Why not plant Green's guaranteed trees in your orchard—our prices are low—here they are: Apples @ 25c and up—Peaches @ 27½c and up—Plums @ 30c and up, etc.

Plant Green's Cortlands for Big Profits

We were the first nurserymen to grow Cortland—the scientifically improved McIntosh. It will pay bigger profits than any apple ever introduced. See our special offer on fifty trees below—a typical Green value—many more Special Collection Offers in

Green's Big 64 Page Free Catalog

Write for it today. It shows our Fruits—Shrubs—Flowers in Nature's colors—contains helpful planting information for Fruit Growers and Home Owners. Read about the many New varieties—"Approved by Green's"—liberal cash discounts for early orders—Landscape Service, etc. Satisfaction guaranteed

GREEN'S NURSERY CO., 56 Green St., Rochester, N. Y.

Stop that COLD . . . before it stops you!

COMMON head colds often "settle" in throat and chest where they may become dangerous—rub Musterole on these parts at the first sniffle—it will relieve congestion by stimulating blood circulation. But don't be satisfied with the noticeable relief you should experience from the first Musterole rub—apply it every hour for five hours and you'll be amazed at the result! Working like the trained hands of a masseur, this famous blend of oil of mustard, camphor, menthol and other helpful ingredients brings relief naturally. It penetrates and stimulates blood circulation and helps to draw out infection and pain. Used by millions for 20 years. Recommended by many doctors and nurses. Keep Musterole handy—jars and tubes.

To Mothers—Musterole is also made in milder form for babies and small children. Ask for Children's Musterole.

» THE OSPRAYMO WAY « IS THE RIGHT WAY TO SPRAY

A non-clog sprayer. Revolving agitator with brushes cleans suction strainers. We make hand sprayers, orchard power rigs, traction truck crop sprayers. A sprayer for every need, high pressure guaranteed. They double your dollars. Tell us your problems. Our 47 years' experience at your service.

Insist on "OSPRAYMO" trademark.

THE YOUNG PEOPLE

My Favorite President

By Margaret Miller

I WOULD like to write my story of George Washington, so appropriately called the "Father of his country," who sacrificed his personal comforts and, in part, his wealth, to free a liberty loving people from tyranny, and so wisely launched the Ship of State on its journey through the centuries.

I would, also, like to write of Woodrow Wilson, the idealist and, no doubt, the greatest scholar and gentleman ever president of our republic, whose chief ambition to secure world peace was frustrated because of biased partisanship.

But I prefer to take for my subject one who, I think, was the most typical American.

Born in an obscure log cabin, reared in the school of adversity and poverty but by dint of persistent application and a healthy optimism he surmounted a commonplace heredity and an unenviable environment by a proper development of a noble self.

Abraham Lincoln never espoused a cause for the sake of popular opinion but only upon its merits and thus he wrote his name into the hearts of the common people indelibly for all time as a real statesman.

He wisely conducted the affairs of government during the greatest crisis of our country's history and succeeded in successfully writing finis to the doctrine of State's Rights.

Sadly, at last he was compelled to sacrifice his life to free an enslaved people, and now he belongs to the ages.

Hope Lehigh, Pennsylvania

The Editor Answers

WALTER SCOTT of New Jersey, who asks for several nice games for a birthday party on January 11th. Our space is limited, but here are a few:—

To Start the Party

Have a boy or girl act as Old Lady in the Shoe. Give him a bed-room slipper. The other children are to touch something wooden, the wall, chairs, etc., and they must always keep moving. The old lady, with the slipper, proceeds to tug. She has a base. When she has tagged three children and taken them to the base, which is the Old Shoe, then the first one tagged becomes the old lady. The others are freed and the game progresses.

On a Line

String a dried prune or raisin on a twine. Be sure the string is clean. Prepare a number of these, with the

Mary M. Mowry, Pennsylvania

Gertrude Wilson, New York
First Prize

fruit in the center, and about 18 inches of twine on either side. Then seat the guests flat on the floor with the soles of their shoes together. At a signal the children are to start to chew the twine into their mouths, not using their hands. One has one end of twine, the other, the other end. The person who reaches the fruit first may have it. Stick candy may be substituted for the fruit.

The Drawing Lesson

Distribute paper, pencils and erasers to the players and see that they are provided with a magazine or something stiff to rest their drawing papers on. The leader should provide himself with a picture which he has cut from a magazine and which he carefully conceals from the crowd. Very carefully and slowly, step by step, he describes this picture to the players, and just as carefully the players try to draw what he is describing.

His description and manner of giving it might sound something like this: The picture I have before me is almost square on the space it occupies, although it is not enclosed in a square frame. Directly in the foreground is the oval top of a table, presumably a dining table, set with a large scalloped dolly which does not come to within several inches of the edge. Back of the table and to the left of the picture, is a man examining little Jim's report card which he holds in his left hand while his right grasps a fork which is touching the buckwheat cake on his plate. He is dressed in soft white shirt, large patterned tie, etc."

This game causes a great deal of fun and the laughter is apt to become hilarious when the finished drawings are pinned to a sheet hung across an open doorway and a vote taken for the most successful attempt.

The Rules

Kathryn Unruh of Delaware, who asks about the rules of our page. There are no rules, just send in as many contributions as you like. We like to hear from all our readers about their pets, the books they read, or anything they think will be of interest to others. Watch for the new contests every month.

Patriotic Question

Dorothy Bain of Pennsylvania. The answer to question No. 9 in List No. 3 of the Patriotic Contest is "The Ohio River."

Patriotic Contest

PRIZE WINNERS

FIRST prize in this contest will be sent to Margaret Miller of Pennsylvania. This prize is a beautiful American flag which we hope Margaret will like. Her story "My Favorite President" appears elsewhere on this page.

Book prizes will be sent to the following: From Pennsylvania, Dorothy M. L. Cromer, Elverda Acre, Dora B. Foster, S. Thompson Watts, Max Kline, and John F. Rumler. From West Virginia—Ralph Hartley, Gay-

nell Casto, Ruth King, Luella Taylor and Myrtle Moore. From Maryland—William Wonderly and Wilbur Hoopgardner; and Gertrude E. Wilson of New York.

Then the self-portraits for which we asked recently are also to be found on this page. The picture receiving first prize goes to Gertrude Wilson of New York State. All the others whose portraits appear have received gifts from Pennsylvania Farmer.

ALL ABOUT KATE

Each answer is composed of one word ending with the letters "e-a-t-e", for instance: Kate is a good pleader (advocate).

1. Kate is a good pleader.
2. Kate judges judicially.
3. Kate is apt to use other people's money wrongfully.
4. Kate is very frail.
5. Kate sometimes gets out of joint.
6. Kate makes everything double.
7. Kate loves to teach.
8. Kate takes out ink spots.
9. Kate helps people out of difficulties.
10. Kate is good at constructing.
11. Kate gives a pledge of security.
12. Kate sometimes invokes evil.
13. Kate is perplexing; hard to understand.

PASSING EVENTS IN PICTURES

(Copyright by Universal & International)

1. Chicago, Ill.—Dr. Isadore S. Falk, professor of hygiene and bacteriology at the University of Chicago, who has discovered and isolated the germ responsible for influenza. This find, the most important yet made in the fight to prevent influenza epidemics, is the result of Dr. Falk's six-year effort to detect which of dozens of possible bacteria might be convicted of causing the disease.

2. Cardington, England.—An unusual photo. Some of the members of Parliament walking across the gangway from the mooring mast to the "R-101" here. Owing to weather conditions, the trip was postponed for the second time. A mast similar to the one in the photo will be erected atop the 85-story Empire Trust Building in New York City, according to Al Smith.

3. East Boston, Mass.—Miss Tanner, daughter of constructor of the world's largest ship model, Elmer Tanner, standing beside her father's masterpiece, an exact replica of the ill-fated "Thomas W. Lawson," the only seven-masted schooner ever built, which he will accompany on its final voyage to the Science Museum at South Kensington, London.

4. Miami, Fla.—The first air photo of what vast fields of sugar cane are doing to the famous Everglades of Florida. This section of fields, town and mill is a few miles from Canal Point on Lake Okeechobee. Javanese-Himalaya cane here reaches a height of from 20 to 22 feet. The soil in this reclaimed district is said

to be as black and fertile as that in the valley of the Nile.

5. Joseph R. Grundy, right, was installed recently as a member of the United States Senate from the state of Pennsylvania, succeeding William S. Vare, who was rejected, photographed with his colleague, Senator David A. Reed, left, at Washington shortly after he had taken the oath of office.

6. Port-Au-Prince, Haiti.—Photo shows an idea of the quiet that prevailed throughout Haiti, which the cruiser "Galveston" with its regular marine detachment of fifty men found when they arrived—a peaceful scene in front of the famous Palace of Justice here.

Feeds that fill Milk Pails and Pocket-books!

WISE dairymen have learned that the secret of increasing milk profit is in intelligent feeding. They feed Quaker Dairy Ration because this feed goes farther and makes more milk—thus getting maximum production and maximum profits.

Quaker 24% Dairy Ration is recommended as a highly efficient protein concentrate, rich in essential minerals. It makes an ideal ration for your own blending and supplements splendidly your own roughage. There's really no feed like it to maintain your herd in vigorous, profit-producing condition throughout the Winter.

You'll find your cows relish it. You'll also discover to your delight that your feed investment is less. It means money in your pocket-book to know about these advantages which come from using *proved, tested, scientifically blended* Quaker Dairy Rations. See your Quaker Dealer at once.

Quaker Sugared Schumacher—is the complete carbohydrate feed; combines perfectly with any Quaker high protein concentrate (24%, 20% or 16%). A choice feed for all young or dry stock; an entire grain ration for horses, steers, lambs and swine.

Farm and Dairy

By L. W. LIGHTY

THE farmer's occupation requires constant thinking and planning, but when the rush of work is on and the days are long physical exertion is so great that often we have not much energy left for mental work. With the cessation of field operations we find time to meet with our fellow workers, consider and endeavor to correct our mistakes and improve our successes.

Progress and improvement in some lines of effort have been more spectacular than in farming the last half century, but I doubt if any are more substantial. I knew the farming in several counties in two states then and it was my occupation. Two score years ago I was acquainted with much of the farming in this state and all the adjacent states and because I was in the game I can see the phenomenal revolution in thought and in action.

Then in the rural community there was a character known as the "book-farmer," the butt of numberless jokes. His origin was some would-be educated misfit who blundered a spell and then failed. Education and farming had no connection; in fact higher education was inimical to good farming. Outside of very backward communities this is a thing of the past. The younger generation of farmers has a great desire to secure information and training that enables them to think logically and plan practically and efficiently. The general existence of this desire is forcefully brought to me by the number of inquiries coming to me relative to reading or correspondence courses or the best books on the several lines of farm effort.

The Five-Foot Book Shelf

Measuring books by the linear foot never appealed to me. The footage of my books on agriculture is more than ten times five, but I suspect I could pack the gist of it all as far as the practical farmer cares into about three feet of shelf. I will mention some of these books for the inquirers who tell me their time is limited and they want the best in the briefest form.

The fertility or productive power of the land is of course the foundation of all successful farming. Information that helps us to build and to maintain this condition on our farm is of the first importance. The outstanding book in this division is "The Fertility of the Land," by I. P. Roberts. A very close second is "Crops & Methods for Soil Improvement" by Alva Agee. These lay down fundamental truths in an impartial manner, briefly and understandingly.

Then because of the large use we make of commercial fertilizer and the great amount of money it costs, it pays us to have a pretty clear understanding of the nature and function of these purchased plant foods and how to use them most profitably and economically. One of the best, if not the best book in this phase of soil improvement, is "Fertilizer" by E. B. Voorhees.

Whys and Wherefores

For the man who loves to get behind the whys and wherefores, who loves to dig down to the foundation of which this science is built I will say add to the above a three-volume work entitled "Agriculture" by F. H. Storer. But here you have about 1,800 pages containing some 700,000 words. It is exhaustive and it is interesting. Indeed to me it was fascinating when I read it the first time. It is a gold mine for the student farmer.

With minor exceptions animal husbandry is an inseparable part of the farm management. When I was with the tobacco growers, potato growers, fruit growers and others, some form of animal husbandry always was an important element. Hence the next

books I would place on that shelf to use would be "Feeds and Feeding" by Henry & Morrison, and of equal importance would be "Principles of Breeding" by E. Davenport. Both of these works are pretty extensive and exhaustive but reliable and always helpful to the practical man. To these two it is well to add "Types and Breeds of Farm Animals" by C. S. Plumb. The next book would be "Agricultural Bacteriology" by W. H. Conn. Every man and woman on the farm needs information relative to the microscopic life we have to deal with. Another book I found of great value is "Physics of Agriculture" by F. H. King. All these books will rest on a 20 inch shelf and need not be packed. From this point we need books along specialties whatever we practice on the farm.

Without Pasture

I am much interested to know if it is possible to feed a dairy cow the whole year on solid feed such as silage, hay and grain, or any good feed, not feeding any summer pasture. Please answer the following questions as correctly as possible. (This cow to be any type of good cow that will give 100 gallons of four per cent milk or better.) Will a cow eat a good grade of silage the whole year? How much silage will it take to feed her? How many tons of hay or roughage to feed her? How many tons of grain to feed her? To your best judgment would it be possible to run a one-year rotation of corn that is to be raised for silage in the same field year after year if one used plenty of good commercial fertilizer and manure? Also sow something in the last cultivation to turn down for a green manure? A. M. Custer.

YES, it is possible to keep cows year after year on grain, hay and silage or green crops. The Pennsylvania State College herd has been kept in this way for thirty years or more, simply for the reason that no pasture is available which is near enough to the dairy barns to make its use practical. This does not mean that a dairy cattle feeding system without pasture is the better method, but it can be used where no pasture is available. However, some green crops are cut and fed to a moderate extent during the summer. These include green alfalfa, soy beans, green corn, etc.

A cow will eat about ten pounds of hay daily and 30 pounds of silage per thousand pounds of live weight. This would mean a ton and a half to two tons of hay per cow per year, and three to four tons of silage. The cow producing 100 gallons or 8,000 pounds of four per cent milk should have one pound of grain for approximately three and one-half pounds of milk. This would mean one and one-fourth to one and one-half tons of grain per cow per year.

It would be possible to raise corn for silage in the same field for a few years by the use of commercial fertilizer, manure and green manure. Yet it is doubtful whether it would be advisable to attempt this practice for a considerable period of years. It is true that at the Rothamstead Experiment Station in England wheat has been raised continuously on the same plots for a period of over 80 years with the use of commercial fertilizer and manure, yet the ground has become very much infested with weeds. The experience of farmers in central and northwestern United States where wheat was raised continuously year after year led them to adopt a crop rotation system.

You could perhaps raise corn in the same field successfully for a period of three or four years by using commercial fertilizer, barnyard manure and green manure, but it is probable that at the end of that time you would find it advantageous to grow some other crop in the field for a year or two. A. A. Borland.

Proved on your Research Farm

Larro Dairy Ration has been improved. Your Larro Research Farm has scored a noteworthy triumph. The feed which for seventeen years has been the standard by which all other feeds have been judged is even better than it was before.

The phrase "As Good As Larro" must now take on a new meaning.

The new Larro by virtue of higher milk production has a greater feeding value than the old Larro by more than \$3.00 a ton, based on present values for feed and milk,—\$3.00 a ton more profit for Larro feeders, and the improved Larro costs no more.

This improved Larro was not a stroke of chance. For more than seventeen years, the Larro Research Farm has been at work checking and testing feeds. Theories about proteins, vitamins, minerals and roughage have been tested by actual feeding trials under practical farm conditions in more than one hundred different formulas. The improved Larro has been under test for five years against many other combinations of feeds. Under long and short time tests and under many varying conditions its greater feeding value has been proved beyond question.

The improvement is not sensational—no feed could be sensationally better than the old Larro—but \$3.00 a ton added to the high profit over feed cost that Larro feeders have already been getting is a notable accomplishment.

Where tests are made under actual farm conditions.

Each cow is fed individually.

plishment. As a uniform health-building feed the new ration is the same as Larro always has been. The Larro Research Farm is your farm. It is working for you continuously, searching for better feeds but in no case will a change be instituted until it has been proved definitely to be a change for the better.

We repeat our promise of many years' standing. **The Larro Formula will not be changed unless a better one can be found. If it is changed you will be told about it. The quality of Larro will never be lowered as long as Larro is made.**

A BRACE OF TWINS

This is Miss Hattie Judy of Pendleton county, W. Va., and her four twin calves. They are worth \$20 apiece, making a profit on two cows of \$200 a year.

—C. P. Warner

Cow-Testing Ass'n Reports

Canton
THE Canton Cow-Testing Association, Bradford county, Pa., closed its sixteenth year November 1, 1929, with 19 whole-year members and two part-year members. The total number of cows was 306. The results of the Association for the sixteen years is as follows:

Year	Lbs. Milk	Lbs. Fat
1913-1914	6052	261.0
1914-1915	5783	260.0
1915-1916	5843	256.7
1916-1917	6210	264.0
1917-1918	6163	262.2
1918-1919	6539	296.8
1919-1920	6550	311.2
1920-1921	7302	318.0
1921-1922	6859	286.9
1922-1923	7576	310.8
1923-1924	6803	288.3
1924-1925	7037	296.1
1925-1926	7455	313.4
1926-1927	7671	322.0
1927-1928	7435	309.4
1928-1929	8151	332.7

Thirteen herds with an average of five or more cows exceeded an average of 300 pounds of fat. Complete list follows:

Owner	Breed	Milk	Fat
W. F. Bohlayer	R.H.	11385	452.4
R. H. Fleming	R.H.	11675	418.5
Emmer Pepper	R.H.	11559	403.7
R. G. Williams & Sons	R.H.	10729	400.7
Earl Wilcox	G.H. & G.J.	9243	372.1
H. S. Wilcox	R.H.	7934	360.1
G. E. Beach	R.H.	9245	338.5

Ralph Jones	R.H. & H.	5784	317.4
J. C. Fleming	R.H.	6701	314.4
Samuel Isaacs	R.H. & H.	8772	314.1
H. G. Wright	R.H. & G.	6439	308.7
G. H. Moody	R.H.	8163	301.0

*High herd in milk.
*Second high herd in milk.

C. W. Beach, R. P. Reber, Tester, County Agent.

Troy
THE Troy Cow-Testing Association of Bradford county, Pa., closed its fourteenth year November 1, 1929, with 14 whole-year members and two part-year members. The total number of cows was 266. The results of the Association for its fourteen years are as follows:

Year	Lbs. Milk	Lbs. Fat
1913-1914	6052	261.0
1914-1915	6255	272.4
1915-1916	5920	266.0
1916-1917	5862	270.0
1917-1918	5843	264.1
1918-1919	6702	276.3
1919-1920	6614	276.4
1920-1921	6975	294.7
1921-1922	6748	291.3
1922-1923	6015	270.2
1923-1924	6317	266.6
1924-1925	7132	278.3
1925-1926	6631	268.9
1926-1927	6590	274.3

Three herds with an average of five or more cows exceeded an average of 200 pounds of fat. Complete list follows:

Owner	Breed	Milk	Fat
Edward Wolfe	R.H.	8285	424.6
John Lewis	R.H. & J.	10435	395.1
"High herd in milk."	R.H. & J.	6363	311.3

*High herd in milk. Wm. I. Foster, 8519 lbs.

H. F. Ayers, P. N. Reber, Tester, County Agent.

Cowanessque Valley
THE Cowanessque Valley Cow-Testing Association finished its fifth year November 1, 1929, with 13 whole-year and eight part-year members. There were 421 cows in the Association during all or part of the year. The results for the Association for the five years are as follows:

Year	Av. No. Cows	Lbs. Milk	Lbs. Fat
1925	299.35	7113	280.0
1926	426.50	7047	254.0
1927	142.50	8086	281.0
1928	205.51	7587	281.0

Pour herds with an average of five or more cows exceeded an average production of 300 pounds of butterfat. A complete list of these herds follows:

Owner	Breed	Milk	Fat
Ivan Keltis	R.H.	9992	328.0
Earl Robbins	R.H. & H.	8916	318.0
Herbert Seeley	R.H. & H.	7804	306.0
Earl Peters	R.H. & J.	7198	300.0
Neil Stranahan	Paul P. Korber, County Agent		

Cumberland County
COUNTY Dairy Herd Improvement Association finished its tenth year September 15, 1929, with 31 members. The records show that there were 54 cows in the Association during all or part of the year.

Mr. A. A. Raudabaugh has been tester in the Association since it started and he is now on his eleventh successive year, and holds the record in Pennsylvania Dairy Herd Improvement Associations as the largest number of successive years in one association.

Many of the members' herds have increased their average production considerably year by year and Mr. V. Otto's herd has an average of 12,624 pounds of milk and 423 pounds of fat for the ten successive years. This is the highest average production per cow of any herd in United States.

Mr. Raudabaugh has drawn the following diagram in connection with his work as a tester:

The results for the ten years' work in the Association are as follows:

Year	Av. No. Cows	Milk	Fat
1919-1920	276.20	7325	3.3
1920-1921	312.17	8355	3.4
1921-1922	278.64	8578	3.6
1922-1923	293.08	8713	3.6
1923-1924	266.67	9779	3.6
1924-1925	253.68	8990	3.6
1925-1926	278.34	9777	3.5
1926-1927	311.58	9714	3.5
1927-1928	269.60	9317	3.7
1928-1929	422.83	9907	3.7
Incr. ten yrs.	146.63	1982	4

Sixty-seven cows produced over 400 pounds of butterfat. The complete list is too long to print here.

W. I. Galt, County Agent

Veterinary

By Dr. J. F. SHIGLEY

CALVES DIE

I have a bunch of calves which have something like the bloody murrain. Have lost two of them and one more has the same thing. Droppings at first are black, then get thin and in two or three days turn to blood. In three or four days the calves die. W. G. N.

THIS appears to be an infectious disease and its treatment will depend on the correct diagnosis. Call your veterinarian for diagnosis and in the meantime separate the well and affected calves to prevent further spread.

LAME MARE

I have a mare 19 years old that is lame in her front foot. Her ankle is hard, seems swollen. C. A. Kough.

PROVIDED that you have correctly diagnosed the point of lameness, you can apply heat with warm water; use a liniment or a bandage for support. The animal should be allowed to rest in order to allow the affected part to recover.

SCOURS

I have a bunch of calves that have the scours; also some have a cough. Otherwise they are thrifty and growing. A. C. H.

SCOURS that appear early in life may be due to an infection that can be controlled by careful attention to sanitary measures and through the use of drugs. Anti-calf scour serum may be used on these cases to advantage.

As the calves reach of one month or more, scours is more often due to irregular feeding, overfeeding or a combination of these factors with an intestinal infection. Regularity of feeding and watering, restriction of diet, clean quarters are fundamental in control. Small doses of castor oil may be administered. Inasmuch as scours may be a symptom of certain diseases, it is advisable to call your veterinarian. The advice regarding the cough would vary depending on the age of the calves and this was omitted in the letter.

PROBABLY GARGET

I have a sick cow. I shipped a calf about three weeks ago. This cow was giving eight to ten quarts per milking. Last Thursday morning she failed to give a quart. Three tests were made and one was hard. I called my neighbor and he gave her one pound of salts and ginger. Saying she had indigestion from eating sweet potatoes. Later I gave her another pound and she then her bowels are just runny. I am rubbing her udder in hot water and bathing in liniment. L. R. M.

THIS was probably a case of garget from the start and two pounds of salts is too much for such cases. It will be necessary to tempt this cow's appetite with various foods to bring it back. Continue bathing the udder with warm water and milk the cow every two to three hours. You would do well to consult your veterinarian about the case and secure from him a tonic best suited to bring her back on feed promptly.

DIFFICULTY IN BREATHING

Can you give me any information about a heifer that is due to freshen soon? She took what I thought was a cold about six weeks ago and she still continues to blow some and have difficulty in breathing. Apparently it does not hurt her. She has been tested twice for tuberculosis. W. S. H.

THIS may be due to a complication of a cold and pregnancy. It is possible that it may be due to pregnancy alone. During the latter part of pregnancy the abdomen is so full that the breathing space is greatly reduced. After freshening this cow will probably be normal again.

This Cow Produced 728 lbs. of Butter-fat in 305 Days

THIS is a comparative study of two succeeding lactations of a high-producing Guernsey cow which tells a very interesting story.

During her third lactation this pure-bred Guernsey produced 12,450.2 lbs. of milk and 635.9 lbs. butter-fat. She was producing at a record clip—almost any dairymen would be satisfied with such production, but see what happened during the next year.

During the next year, her fourth lactation, this cow received the same feed and care as during the previous year. She was owned and cared for by the same man. But during this lactation the cow received Dr. Hess Improved Stock Tonic twice daily in her feed. The Tonic was started 60 days before calving to condition her for freshening.

Steel

Yes, Sir!
I've Got It! The
Greatest Improvement
in Fence Wire in
Ages and It Means
a Saving of Millions
of Dollars to
Farmers Every
Year.

Before You Buy Fencing

be sure to send for my New Catalog—JUST OUT—read the amazing story about my New Copper Steel Wire from which all my fencing is now made. Read how Copper Steel was discovered—how it has been subjected to "out-in-the-weather" tests by the American Society for Testing Materials. In comparison with non-copper steel these tests have proved that Copper Steel lasts at least TWICE as long.

This is the greatest improvement in fence making in 50 years and you can readily see the hundreds, thousands, yes millions of dollars this tremendously longer-life Copper Steel Fencing will save fence buyers. Besides, Brown Fence is Super-Zinc Galvanized, the most durable method of galvanizing known in the fence industry. Don't buy a rod of fence until you get the New Jim Brown Catalog and read all about it. And remember, this wonderful improvement—this amazing "longer-life" fencing is yours at NO INCREASE IN PRICES.

My Prices are Lower I Pay the Freight

I want to send every reader of this paper my NEW CATALOG. I want you to see with your own eyes the money you can save on over 200 styles of my Copper Steel Fencing, Ring Knot and Hinged Joint styles, also Poultry Netting, Barb Wire, Steel Posts, Farm and Poultry Gates, Metal and Ready Roofing, Paints, Furnaces, Heaters, Ranges, Oil Stoves, Baby Chicks, Brooders, Poultry Supplies, Sprayers, Cream Separators, Nursery Stock, Auto Tires, etc.

Not only are my prices lower but I PAY THE FREIGHT. That takes all guesswork out of what my goods cost you laid down at your freight station. You will be surprised at the big savings you get. It makes no difference where you live you can take advantage of these big savings in buying from Jim Brown's Big Factories. Orders are shipped in 24 hours from my three big factories at Cleveland, Ohio, Adrian, Mich., Memphis, Tenn., and 35 other shipping points scattered over the country. It doesn't take long to get goods from Jim Brown.

Satisfaction Guaranteed

I want to say a word about the QUALITY of my goods. Low prices don't mean a thing unless the Quality is right, and that's the point I want to emphasize right here. I put my personal guarantee on everything you buy from me—a guarantee that INSURES you QUALITY and complete SATISFACTION—a guarantee that has never been broken since it was first made, over 40 years ago. You can bank on Jim Brown's Quality—always. Over a million customers are buying direct from my factories. They are SAVING a lot of money through my STRAIGHT LINE SELLING PLAN which cuts out all in-between profits. You can save money too.

Mail Coupon NOW! Fill out and mail the coupon. You'll be glad you sent it, because, if you need any of the many things it contains, you will not only save money, but you will be highly pleased with what you get and the prompt service I will give you.—JIM BROWN.

This up-to-date "B" Battery

THE Eveready Layerbilt

lasts longer and costs
less in the long run...

LAYERBILT CONSTRUCTION
Here is the exclusive Eveready Layerbilt construction. Only 5 solderings and 2 broad connecting bands, all other connections being made automatically. Waste space eliminated. Layerbilt construction is a patented Eveready feature. Only Eveready makes Layerbilt Batteries.

CYLINDRICAL CELL CONSTRUCTION
This is a typical cylindrical-cell "B" battery. It requires 29 fine wires and 60 solderings—89 chances for trouble. Notice the waste of space between cells.

WHEN you buy your next "B" battery, you will want to choose the one which gives you longest use at least cost. That means Eveready Layerbilt.

The new Eveready Layerbilt "B" Battery has been developed to bring greater economy to battery users. Because it is made of flat cells, it will last from 25% to 30% longer than the cylindrical-cell battery of the same size. There are no waste spaces as is the case in cylindrical-cell batteries. The flat cells fit together tightly, giving you more active material for your money.

Furthermore, an ordinary "B" battery assembled of separate, independent cells (be they round, square or any other shape) needs 60 solderings and 29 fine wires, making 89 places where trouble can develop. The flat cells in an Eveready Layerbilt, however, make connection with each other automatically. Only five solderings are needed, and only two broad connecting bands, each $\frac{3}{4}$ inch wide. This means the utmost in reliability.

Eveready Layerbilts come in two sizes: Medium No. 485 (\$2.95) and Large Size No. 486 (\$4.25). Either costs only a few cents more than the cylindrical-cell Eveready of the same size and will last from 25% to 30% longer. Look for the Eveready Layerbilt name on the label.

EVEREADY Radio Batteries

Farm Facts and Fancies

By ALVA AGEE

IN the game of roque some players find many occasions to offer an alibi when shots are unsuccessful. It was a flaw in the boundary wall that prevented the ball in its rebound from making a hit, the ball traveled a straight line nearly the length of the court and then, of its own volition, curved and made a miss—anything except fault in the player.

If some fault occurred before the ball left the mallet, and an alibi is out of the question, responsibility is accepted only half-heartedly. The habit doesn't pay, and I have tried to drop it, but it is a frailty tied up in all human affairs.

Nature is headstrong, but about half the time a partial crop failure comes because the land had not been drained, or it lacked organic matter to hold moisture during drought, or seed was not known to be dependable, or a half dozen other "ors." It is not a comfortable or comforting view to take, but it is better to assume too much responsibility for failure than too little.

A Perfect Alibi

The control of rainfall is beyond us. This morning I was talking with one of the U. S. Weather Bureau staff located in San Diego. The year of record begins July first, and in the last half of 1929 the rainfall has been twenty-six hundredths of an inch.

Southern California has much in common with Palestine in respect to climate, and it knows exactly what Biblical writers meant by "the first rain and the latter rain." The former is due in November, but failed to come. The latter comes in the fore part of the new year, and then there is little rainfall until the next November. The early rains help to fill the storage reservoirs, and start the grass on the immense cattle ranches.

This winter there is little feed on the ranges. A quarter of an inch of water in six to eight months affords an alibi no one can question, and the serious matter now is whether the "latter" rains will come early in 1930. The Northwest had its drought broken by a deluge of water, but up there the normal rainfall is relatively heavy. The eastern farmer is not given to bragging on his particular part of the country, but he has a good deal to brag about.

Manure on Poor Land

Mr. Zinn has told us that he could have built up his farm in a much shorter time if he had understood the value of fertilizers and not depended chiefly on livestock. We know he is right, and we can accept the statement without marking down the value of manure as low as many scientific tests indicate.

When we compare manure with the right commercial fertilizer as a source of plant food for a crop, the value per ton is lower than we supposed years ago, but there is surprising ability in a light top-dressing of manure to get a catch of grass that is not shown by an application of fertilizer containing an equal amount of plant food. This effect of manure is known by most farmers. When we point out this effect to a scientist he talks to us about bacteria in the manure and bacterial action stirred in the soil. Doubtless he is right, and anyway the man who says "bacteria" always has the best of the argument because the other fellow has nothing he can say in reply.

The point that is important, as I see it, is that for a poor soil manure has a value not shown by analysis. The man who feeds livestock and top-dresses poor parts of fields with the manure before seeding down for a sod gets more per ton from it than the value usually placed upon it by those who test manure with fertilizers as a source of plant food for crops growing

in soil that is in pretty good condition.

Government Control

The telegraph, cable and radio people want the Congress to authorize a combination, and propose that the government regulate the combination. We now have the advantages of government control of railroads without the responsibility of ownership. All along the line competition is being dropped for gain in efficiency.

It was not many years ago that competition was regarded by us as a cherished possession that must be guarded by all means. Now we criticize the waste that necessarily attends competition and want service and goods in maximum amount and minimum cost, and that means mergers if only they are controlled.

I should keep up to date, but when one was trained to regard free competition as the birth-right of the American, it isn't easy to turn readily to the new attitude. I reckon the public must be right in the matter, and mergers do increase efficiency and raise the level of living, but the price we pay is much surrender of individual rights and opportunities and increased dependence upon the power of government officials.

We are going fast; if it is in the right direction, that is all to the good. Of course I have mentioned this before, and hope to do so again, because we should realize fully just what we are doing.

Needs and Wants

A most satisfactory present was a gift I made to myself. It is a carpenter's vise. I now have no particular use for it, and no friend would have selected it for me, but there was the hang-over in my mind from past years that it was among my wants, and that it would be a mighty handy thing to have around if any need for it arose. I sold one once along with the building to which it was fastened, and ever since I have wanted another but could not justify the purchase on the score of need. I did not think in a straight line about the matter, and it is worth mention because some others make the same mistake. It is entirely easy to get more out of a small sum of money in satisfying a want than a need.

When wives felt more dependent on husbands financially than is now the rule I learned by chance that there was a hardship in any accounting because one might be glad to ignore some need so that something wanted could be got in its stead. Needs of many sorts are a matter of convention, and decision is made by the general public. That applies to clothes, furniture and even kinds and quality of food. What others do we accept as necessary for us.

Wants, on the other hand, are a personal matter, and if one prefers to pass by something listed by convention as a need, and instead to meet a harmless personal want no explanation or excuse should be necessary. It is on that basis that I now own a carpenter's vise. The fact that I expect to find occasional use for it is wholly aside from the mark. I am wishing that people who are in a somewhat dependent financial relation to others could have the benefit of this view.

THE COVER THIS WEEK

ROGER WILLIAMS' Church, Providence, R. I., is the oldest Baptist church in America. It was founded by Roger Williams in 1638. The present building, shown on our cover this week, was erected in 1775. Commencement of Brown University has been held here since Revolutionary days.

Glass Houses

By FRANK K. RICH

"TAKE a man that's always lookin' out for blemishes in other people," Caleb Peaslee observed, "and it stands him in hand to be a mite careful of his own actions—safer way, you know. Wouldn't you say so, Hyne?" He partly turned his head toward Deacon Hyne, to give more force to his question.

"Anybody'd say so," the deacon grunted. "Who've you got in mind this time? Me?" He showed a degree of truculence that caused Caleb to raise a protesting hand.

"Not a mite of it, Hyne," he assured his companion. "I was jest thinkin' of 'Lisha Chadwick; he stopped here a minute this mornin' and on-burdened his mind c'ncernin' the shortcomin' of his wife, and the whole proceedin' give rise to thoughts in my mind that I had some idea of tellin' you about—if it happens that you'd care to listen to 'em, that is to say?" He darted a questioning glance at the deacon.

The deacon, his apprehension allayed, signified his willingness to listen.

A Wife's Faults

"I was out in front of the house," Caleb began, "paintin' the fence; my wife's been deamin' me to git about it for a month, I guess, so this mornin' I went to work on it. I'd jest got it cleverly finished and set the paint back inside the gate when 'Lisha come along. He had his lips pouted out and a kind of scowl on his face—signs 'nough that I was goin' to be treated to some kind of a lecture, 'less I headed him off; but I made up my mind to listen and let him git shut of his grievance.

"Sure enough, he come to a halt by the fence and hardly give me the chance to pass the time of day with him b'fore he begun.

"My wife's an awful heedless person," he says, lookin' at me 'sif I was in a measure responsible for her actions; not that he really thought so, but he looked it. 'I talk to her and c'rect her,' he says, 'and for all the good it does, seeminly, it might be a sparrow chirpin'.' he says, bitter enough.

"Well, well!" I says, soothin' him to tote him on. 'What's Luella been up to now?' I asked him.

"It ain't alone now," he says, pettish-like. 'It's day in and day out, day after day and time after time. She does things without ever lookin' ahead to see what the outcome'll be—careless things,' he says, 'that lead to trouble for her or somebody else—most of the time trouble for me,' he complained.

Careless Every Day

"I couldn't begin to tell you the number of things she does wrong in the course of a week," he says, "but I'll say this: that never a day goes by that I don't have to speak to her about some careless thing she's up and done—leavin' a door open so the flies come in, or settin' somethin' down on a chair where a person'll git onto it if they don't watch sharp, or somethin' else of that nature," he says. "Why'n't you look at a chair b'fore you seeddown in it?" I says. "That'd take care of a part of your troubles," I pointed out to him.

"A chair is s'posed to be a thing to set in," he snaps out, "and anybody but a woman'd take that thought and use it 'cordinly."

"And about the doors lettin' in the flies," I says, "most men'd think to put on a spring to keep the door shut of itself."

"A man can't think of everything," he says, "and anyway, there wouldn't be any need if he wa'n't so heedless."

"This very mornin'," he says, "he up and set a pail of sour milk on the back steps; she was goin' out to feed the pig, but I called her back to find

(Continued on page 38)

Spread the CASE way for increased yields

CASE TRACTOR PLOW does a remarkably fine job and there's practically no wear-out to it. Extra-easy to operate.

CASE TRACTOR DISK HARROW—deep penetration—heat-treated disks stay sharp and wear longer.

CASE LIME SPREADER attachment makes the Case Manure Spreader a double-purpose machine.

THE CASE Manure Spreader brings larger crops and extra profits because it spreads so finely and evenly that every square foot of ground gets its full share of valuable plant food.

There are no bare spots, no over-manured spots with a Case Spreader on the job—no waste—perfect coverage. Works fast, too—spreads 7 feet wide.

The Case Spreader loads easily, runs easily and turns short. Its construction is extra-strong—there's practically no wear-out to it—use it and see.

You can't buy a machine that will be more profitable over a long stretch of years than this low-down Case Spreader.

There's a Case dealer near you—make it a point to see him soon and get full details. Or write to factory for interesting, well illustrated folder—it's free.

DEALERS WANTED Write for Prices

LANCASTER BONE FERTILIZER CO.

Lancaster, Pa. Quincy, Ill. Peoria, Ill.

YOUR WHEAT

Will do better and pay better if you feed it the plant food it requires—nitrogen, quick-acting nitrogen. Chilean Nitrate of Soda.

As soon as spring growth begins, apply 100 to 200 lbs. of Chilean Nitrate per acre. This is the money making method. It increases the yield from 8 to 12 or 15 bushels per acre.

YOUR APPLES

Will respond immediately to a ration of Chilean Nitrate. Often it doubles the yield per tree. This quick-acting nitrogen fertilizer, applied in early spring, helps two ways. 1. It sets more fruit the same year. 2. Stimulates spur growth and increases fruit bud formation the following year.

Broadcast Chilean Nitrate around your trees. Quantity depends on tree age and condition, a few pounds per tree—say 15c worth—will do the trick.

Chilean Nitrate cuts down your cost of growing through the big yields it makes. It is the world's only natural nitrate fertilizer.

Free Book Tells How

Our new 44-page illustrated book, "How to Fertilize Your Crops" gives full information covering wheat, apples and all other crops. It is free. Ask for Book No. 1, or tear out this ad and mail it with your name and address

Now! Town and Country Home Owners Are Dressing Up Their Grounds

What a change in the last few years! No longer does one find the barren, uninteresting places of yesterday, for today they are dressed with colorful flowering shrubs, trees and plants.

For many years we have been assisting our friends and customers in beautifying their home grounds. In fact, so many home owners call upon us for advice that we have a special department to solve their home planting problems. We furnish complete plans that show just how to do it. These plans are free as explained in our new catalog.

New Varieties of Fruits and Flowers "Approved by Green's"

All have proved worthy of our endorsement—no we recommend them to you.

Here are just a few: Tallman Rose, Rosa Hugoni—"the golden rose of China," Watson's Delphinium, Viola Jarkins and Simpson's Delphinium, Vasey's Genie—two new perennials, Beauty Bush—a fountain of pink loveliness, Mastodon

Strawberry—Coco Grape—Bosc Pear—and the Cortland Apple—the scientifically improved McIntosh.

In addition to the many new varieties, we offer hundreds of others, including those good old standbys you just can't do without—ready to add beauty and value to your grounds and profits in your orchards.

Send for Green's Free Catalog now

It is distinctively different—illustrated in Nature's colors with 64 pages of helpful planting information for Home Owners and Fruit Growers. It contains many Special Collection Offers, such as 50 Cortland Apple Trees for \$12.50.

Buy direct from Green's at grower's prices—you save half. Cash Discounts for early orders—Satisfaction Guaranteed.

GREEN'S NURSERY COMPANY

57 Green Street
Rochester, N. Y.

By R. P. KESTER

WELL, Christmas is over and the work of another day demands our attention. This reminds us that, no matter how joyous an occasion or how high we may sail in the clouds of pleasure temporarily, we must quickly get back to earth and to work. I guess that it is better so. People who never have any work to do seem to have a harder time living their lives than those whose noses are kept pretty close to the grindstone most of the time.

We spent our Christmas this year at our son's home where a baby boy had succeeded in appearing in time for Christmas, having a margin to spare of sixteen days. It is needless to say that it was a happy Christmas in that home. The other small member of the family, a little twenty-three-months-old girl, is accepting the little fellow gracefully, but with more or less dignity. She is fast growing to love him, but watches to see that the elders do not act too silly about him.

The New Year has not made his appearance as this is written and we have had no chance to see what manner of fellow he is. But the advance pictures indicate that he is just about the same naked little fellow as has appeared each New Year's Day since I can remember. In other words, he is much like all new-born infants. They all look much alike. But people are earnestly hoping that he will have a kinder disposition than the old fellow who is just passing into limbo. As the year closes, many people feel that it has not been kind to them. There is unemployment, debt and some near poverty.

I have asked several merchants about their Christmas trade this year, and the replies varied from "poor" to "very good." I found that the replies depended upon the kind of merchandise carried. Those whose stores carried "practical" gifts, that is, articles which could be used and which were also suitable for Christmas presents, did a splendid business. The other kind of Christmas trade goods, those chiefly gaudy or ornamental, did not fare so well. This is probably because people did not have as much money to spend as they have been having for some years.

Catalogues from seed and nursery houses have begun to come in and they will help while away the tedious hours of winter, provided there are any of that kind of hours in your life. No kind of literature coming to our house is more welcome than nice catalogues from reliable houses. Modern business has developed the selling-by-mail idea to a fine art in this country. Not only is it fine from a mechanical point of view, but modern ethics have reached a point where the old school motto, "Honesty is the best policy" is recognized as sound sense.

Of course, there is some of the other kind also,—the kind of circular matter got out to send to the sucker list. But there is no need of being caught by it unless one is a sucker, or is so dishonest in mind as to be looking for something which is offered for nothing. If a person sends only to firms advertised in reputable journals for catalogues and information he will not likely be fooled. Sucker lists are got from others who have been fishing for suckers.

Every year adds conviction to the theory that money spent for good

fertilizers is a good investment. I remember that one year I put double the amount of fertilizer on one-half our sweet corn plot. The cost of the extra fertilizer was four dollars. That half of the plot produced just three times as much marketable corn as the other half. In other words, it produced a crop which sold for fifteen times the cost of the fertilizer, while that from the other half brought only five times the cost of the fertilizer. The work on the two parts from start to finish was the same.

Another feature of the fertilizer question which needs emphasis at this season when plans are being made is that of getting the greatest number of pounds of plant food in each ton. Surely, the time has come when farmers should stop the foolish custom of buying low-grade fertilizers. It costs in time and money to apply fertilizer, then why should they be spent in hauling, handling and applying material that has no more fertility in it than coal ashes?

Friendly Talks

By
Edgar L.
Vincent

"WHERE y' goin'?"

"Oh, I don't know. I'm jest goin'."

And so we trudge on. Foolish, isn't it? For the man who spends his time and strength traveling down a road which for him leads nowhere never does anything really worthwhile. And yet thousands of us are just that foolish.

Can you tell how much it costs you to grow a bushel of the potatoes you put down cellar last fall? What do the eggs we bring in mean to us in cost for care and feed? Don't know! We have to say it if we are really honest.

And that is one reason why so many folks are driven to say, "Farmin' don't pay!" No, farming done along that line does not pay. No business conducted on the "I-don't-know-where-I-am-going" method ever did or ever will pay very big dividends. Poking along in the dark is pretty lonesome business. But it need not be so.

Right now, at the turn of the year, is a good time to start out to know where the road leads. Go down town today and you will find men in the stores busy. Doing what? Finding whether they have been doing business at a profit or a loss. Every department is being thoroughly overhauled, and if any did not bring in a profit expenses will be cut down so that there will be money in it this year.

Now, every life that is lived on the don't-know plan is a big failure; and there is no doubt that thousands are just going on in the dark. Most of these good folks intend some day to top and take their bearings and shape their last days as they know they ought to be lived all the way along, but far too often that time never comes to them, and they go stumbling along to the end.

It need not be so. A good, kind friend has set a Big Light in the window for us all, and if we follow it now and always it will surely bring us safe home. And say, let's take all the home folks with us too. The Light is for us all. It is for you and me if we see it to point it out so that no one need be lost on the way!

No. 2

DO the rural districts of our country have a problem in Americanization? For all of the attention this question receives at the hands of newspapers and magazines devoted to the molding of public opinion or portrayal of conditions, it might not exist.

Of the need for schools in America, of the danger to the national life, and the menace to our traditions that the concentrated groups of foreign born located in our large cities have engendered, we, as a nation of readers, are very familiar. That the conditions and attitudes of mind prevalent in such groups constitute a pressing question that cries for solution, and that demands unremitting effort on the part of America's citizens and her statesmen, is well recognized.

Powerful social agencies have been at work for many years trying to overcome these problems of adjustment. They are doing excellent work and should be encouraged with open mind and hand. Any effort that aims at instilling American ideals in the hearts of our new citizens is worthwhile.

But hangovers of peasant philosophy, colored with superstitions, conceptions of government that still bear the taint of the Middle Ages, class hatred, and narrow foreign nationalism, have in too many instances been little affected by contact with our institutions.

Enough Troubles

Why should there be a German vote, a Polish vote, or even an Irish vote? Surely this country has enough troubles with problems of race, of prohibition, of religion, and of politics, without erecting any purely national barriers, based on European or Asiatic origin. Why divide our population into two groups, Americans and "foreigners"? Consciously and unconsciously we do this; sometimes deliberately, more often without thought of the significance of the act. It is the old, old, human urge, to think better of yourself and your class than of some other individual or class. The danger of such an attitude lies in that it is a state of mind, something intangible, that laws or legislation cannot change.

It would seem also to a thoughtful student of our national life that the blame for the existence of such a state of affairs can be laid directly at the doors of the self-styled Americans; that unknown to themselves they have failed to perpetuate and pass on to others the fine spirit of helpfulness and brotherhood, the lofty ideals of government, and the deep understanding of the ingredients of human happiness, with which the framers of our Constitution were so evidently imbued.

During the last decade our country districts, especially those in close proximity to the eastern manufacturing centers, have received a vast influx of foreign-born residents. Examine the taxing lists of any strictly rural township in the eastern and north central states, compare the names on the present list with those of ten years ago. The evidence is convincing.

Close to the Soil

Thousands of American families, unable or perhaps unwilling to conform to the depressed conditions of agriculture, resultant from the war-inspired over-production, sold their homes and moved into the towns. To have remained on the land would have necessitated, in most cases, a decided lowering of the standard of living reached during the war era.

Their places were taken by people hailing from Russia and Central Europe, particularly from Germany and the old Austro-Hungarian empire. Though largely of peasant origin, this group had, since coming to America as immigrants, been engaged as industrial workers. Always clever with their hands, the men quickly learned to run our machines. Economical and industrious, with a wage rate beyond their fondest hopes, they prospered and creditably saved money. This was invested in real estate, in Liberty bonds, and placed

Our Neighbors From Europe

By ARTHUR GAMBLE

on deposit in savings banks. A comparatively small proportion was sent to parents and relatives in Europe to help tide them over the lean years following the War.

This class of immigrant from the farming and fruit growing sections of Central Europe was by instinct very close to the soil. Their ancestors for generations, both men and women, had sown the crops, cultivated the orchards and vineyards, and gathered the harvests of their communities. They had not necessarily been land owning, often acting as tenants or serving as laborers on some large estate, but their feet had known the touch of freshly turned furrows, and their minds were attuned to problems of acres and seasons.

Consequently, their descendants, cooped in the crowded cities of our industrial districts, found life distasteful and unnatural. Their clean country-reared souls revolted at the dust, the din, and the ceaseless drive of shops and mills. The same sure desire for a better chance that had uprooted them from their ancestral surroundings and sent them wandering to America, with her promise of individual liberty and development, came to their aid once again.

So the immigrant purchased land with his savings and moved his family into the country, often retaining his job in the shop for a few years, while his wife and children raised the crops and fed the animals.

This settling on the land is one of the most hopeful phases of our entire immigrant problem.

It has changed his whole attitude toward his adopted country. In the act of becoming a land owner he has definitely allied himself with our national future. His welfare has become inextricably bound up with some particular community.

Heretofore it had been easily possible for our rural citizen to escape personal responsibility for sharing any concern regarding the problems of Americanization. But when he finds that his nearest neighbor, the man whose land joins his own, has a background acquired in the depressing atmosphere of Czarist Russia, he can no longer evade this responsibility, it has been brought to his very doorway.

It is impossible, even if it were desirable, to avoid contact with our immigrant citizen. Schools and business, social and community organizations make it necessary to deal with him constantly.

The Immigrant's Attitude

He is found to be hard working, simple, naive, and mostly honest, a good fellow ready and anxious to do his part. He comes, without doubt, to his new home in the country with high hopes of betterment for himself and his children, to a type of existence that offers full scope for his wife's ability as a manager and business woman. His attitude toward the older American families living in the district is always friendly and slightly deferential. He is eager to learn their ways, to adopt any custom that seems likely to identify him and his family more closely with their new surroundings.

The kind of life that he knew before coming to America, the suffering and privation, the despotism of which he was a victim, and all of the conditions that made him seek fortune in a new land, have combined to give our thoughtful immigrants a far more poignant (Continued on page 22.)

Florida and Cuba Tour

QUESTIONS and reservations relative to the Pennsylvania Farmer winter vacation tour to Florida and Cuba are arriving at our office daily. Briefly, the tour is run for the benefit of readers who would like a trip to the famous winter vacation section during mid-winter. Special reduced rates have been obtained, which mean a saving of about 50 per cent in cost of such a trip.

Travelers will leave Philadelphia and Harrisburg on February 18th, returning ten days later. They will go through Washington, D. C., and the coast states to Jacksonville, devote a week to Florida, taking in points of interest on both east and west coast as well as the interior of the state, and spend two days and a night in Cuba. Following are some of the questions readers ask about the trip:

Why are you in such a rush to get reservations early in January, when the tour doesn't start until February 18th? I would like a little more time to make up my mind.

February is the very peak of the tourist season in Florida and Cuba. The railroads have trouble finding enough Pullmans to handle the crowds. Every stateroom on the liners sailing between Miami and Havana is engaged months ahead. Hotels in Havana skyrocket their prices and turn away hundreds.

Pennsylvania Farmer already has engaged Pullmans, steamship staterooms and hotel rooms in Havana for the number of people anticipated for this tour. If we are going to need more than this number we must know at once so we can make every effort to accommodate every one. On the other hand, if we are not going to need all the facilities we have reserved, we must release them weeks before the tour starts, and it may be impossible to get them back again for the late comers.

What clothing will my wife and I need for the tour?

You will need nothing that you wouldn't take along if you were going to Harrisburg for the State Farm Products Show or anywhere else where you expect to stay for ten days. Of course, it will be winter when you leave the North and it will be summer in Cuba, so you will need some summer clothes. Detailed suggestions about clothes and baggage will be sent to those who sign up for the tour. It is usually best to travel light, but a few extras will not be a burden on this trip, since baggage need not be taken when we cross to Cuba may be left in your own Pullman section throughout the tour.

My wife and I and my brother-in-law and his wife are considering your tour. We are around sixty and not much used to travel. Do you think we would get along all right?

This tour has been arranged for people just like yourself who want a (Continued on page 32.)

A LITTLE MIXED

IF Senator Nye of North Dakota perseveres as a mixer of metaphors he may equal the Irish statesman who remarked, "I smell a rat. I see it floating in the air, but I will nip it in the bud." The Senator said in a recent discussion: "I feel confident that this troop of pirates in the grain trade, these economic leeches in the Northwest, these barnacles on the grain marketing ship, will be unhorsed and diverted from their purpose."

FROM LIFE

ABOUT forty years ago a young man inherited 3,000 acres of rich land with good buildings and sufficient working capital. Last year he died without any estate. He thought he could make money easier and faster by speculation than by farming, and he continued to speculate until he had nothing left with which to carry on. The great estate which his father had built up by farming and stock-feeding was lost by speculation. This man had no other bad habits, but the habit of speculation has dissipated many a goodly fortune.

A BETTER PROSPECT

THE first half of the current wheat crop year was marked by two major adverse influences—a large carry-over and liberal marketing. With full storages, and importing countries using their own wheat, naturally statistics of total production had less influence on prices than usual. In the other half of the crop year, which ends next June, supplies in storage will be reduced, while importing countries will find that they have used up much of their wheat. Under these circumstances, the total available and prospective supplies will have more influence on the market and the immediate supply less. The turn of the year shows more confidence in wheat, and any crop damage may have greater effect on prices than last year, when reserves were known to be large.

AN UGLY QUESTION

WHEN the wheat market went below the loan basis established by the Farmers' National Grain Corporation that organization offered to buy at the loan price. The market immediately reacted several cents a bushel and the corporation did not have to buy grain, its purpose being accomplished by merely making a bid. This is cited by some persons as a triumph for the Farm Board's new marketing agency, but in reality it is market manipulation by an organization financed with public funds. It is a dangerous policy and some day experience will demonstrate that it is. We would all like to see better wheat prices, but a policy which virtually fixes prices or manipulates markets is not likely to bring about any permanent improvement and

it may cause serious and costly derangements. There is no better price-making agency than the open market, which represents the composite judgment of all interests rather than the judgment of an organization which speculates with public funds. An ugly question has already come to us: "How much did the friends of the insiders make out of the bulge in wheat which the Corporation created by bidding above the market?" That question is bound to arise as a result of such a policy, regardless of the integrity of the Board's or the Corporation's relations with anybody.

THAT FLORIDA-CUBA TRIP

THOSE who know the cost of Southern travel in mid-winter know that our Florida-Cuba trip is not a money-making enterprise. It is in fact an opportunity for a limited number of persons to see what they could not see as individuals for three times the cost. Those who want to improve this opportunity should make their reservations at once. A lot of questions have been asked by readers who are interested and these are answered on pages 5 and 22 of this issue. We shall be glad to answer any others by mail. But the important thing is to make prompt reservation if desiring the trip.

HOG FUTURES

SOME weeks ago we announced that facilities for future trading in hogs might be provided before long. Last week the Chicago Livestock Exchange voted to approve the system and within a few weeks it is expected to be in operation. This is the first organized effort to establish future trading in livestock and nothing but experience will show whether it is a success or a disappointment. For many years future trading has been in effect in the country, under various forms of contract, but it has usually ended in disaster for the buyer or disappointment for the seller. The producer has little to fear from this new attempt to stabilize hog prices and perhaps not a great deal to hope.

NEW PROBLEMS

EVERY new thing brings with it some new problems, business and other. The new method of harvesting small grains brings to the fore a difficult transportation problem. The combine delivers the grain to a motor truck which carries it at once to the shipping station. Harvesting, then, then-hing and then hauling by wagon spread the delivery of grain over a period of weeks and even months. The combine and the truck deliver it within a few days. The railroads cannot haul it all without greatly increasing the number of freight cars, which would be needed for a comparatively brief period. Enlarging local elevator space is difficult too. Providing farm storages to keep up with the use of the combine and the truck is hardly possible. All these and some other difficulties, such as heating of grain in transit, arise with the change in harvesting methods in the grain country. Here in the East, where farm storages are usually ample and transportation is available, we hear nothing of these matters, but they are real problems in the grain country.

TO REDUCE PRODUCTION

IN an address before the American Farm Economics Association Alexander Legge, Chairman of the Federal Farm Board, made the following statement: "A 20 per cent reduction on an average of what he (the farmer) produces would make the tariff on grain effective and give him a higher level of prices. I think it is conservative to say that 20 per cent less production would bring him 20 per cent more money than he is now getting for what he produces." And Mr. Legge thinks further, "It is reasonable to suppose that in time he may grasp the simple problem that

if he can get more money for four bushels of wheat than he can get for five bushels, perhaps he will raise four bushels instead of five bushels."

The above statement was merely incidental to Mr. Legge's discussion but it created more comment than all the rest of his address. In this comment is evidence that the proponents of federal farm relief are not going to be satisfied with anything less than actual operation of stabilization corporations as provided in the Agricultural Marketing Act. An effort will be made to induce or compel the Federal Farm Board to establish stabilization corporations to buy, hold and sell as it has authority to do. Cooperatives which face losses will favor the same policy because the revolving fund may then incur the loss. Perhaps it is best that stabilization corporations should be formed promptly. For the sooner the country has an actual demonstration of the fallacy of this scheme the sooner it can get rid of it. Comment on Mr. Legge's proposal to reduce production by concerted action of producers is hardly necessary. It is an ancient dream that human nature thus far has forbidden to become reality.

A CHANGE IN BOARDS?

A BILL to abolish the Federal Farm Loan Board and turn over its work to the Federal Farm Board is now before Congress. Probably it will be wise to wait awhile before making such a shift. The money loaned to farmers by the federal land banks is obtained by the sale of bonds issued against farm mortgages. These bonds, like other bonds, are merely parts of mortgages, in convenient size and form for investors. It is evident that when investors buy these bonds at par or better the land banks can obtain money at low rates for mortgage loans. Also that when the public does not so buy the banks cannot secure cheap money. For many months the bond market has been in a bad way and the land banks consequently short of loanable funds. But it is not likely that the Federal Farm Board could do anything more than the law and under the circumstances. And it is probable that the public which buys bonds would have less confidence in the new body than in the older one, and less confidence in its securities.

CAREFUL DEMONSTRATIONS

A CERTAIN county agent planned for a demonstration to compare ordinary seed potatoes and high-class certified seed potatoes. The latter showed so much superiority that he became suspicious. Finally he found that the farmer who was cooperating in the demonstration, and who was anxious to show the community the advantages of better seed potatoes, had secretly applied certified fertilizer to the plot on which the certified seed was planted. The farmer meant to help a good cause but he ruined the demonstration. In looking over the results of a certain demonstration we could find no reason for a great difference in favor of one method above another then in comparison. Investigation revealed that the work done on one plot was according to specifications while on the other it was not. Of course the results were worthless, yet that demonstration was seen by many farmers and its results were even published.

All this is not to condemn demonstrations, for they are highly useful. In fact many programs for improvement could hardly be successful without them. It is for the purpose of safeguarding demonstrations so that they may continue to be useful. In all such work the utmost care is essential to secure sound results in which all concerned may have confidence. Most demonstrations are of that nature now, but there are exceptions and there should be none.

New Jersey Farm Comment

By G. W. HARRIS

RESIDENTS from all rural sections of the state, as well as many city dwellers, will turn toward Trenton next week when the Fifteenth Annual Agricultural Convention and Farm Products and Equipment Show opens on January 14th. Here farmers and their wives meet with distant neighbors to discuss through their various farm organizations problems of the past year and plans for the future.

Fourteen farm organizations will hold their annual meetings during these four days. United States Secretary of Agriculture Arthur M. Hyde will be present on Wednesday and will speak to New Jersey farmers on "The Application of National Agricultural Policies to New Jersey."

Four New Jersey farmers will be presented with Master Farmer awards for 1929 on Wednesday evening when the New Jersey Federation of County Boards of Agriculture hold their annual banquet at Hotel Hildebrecht. These men were selected by the Master Farmer Judges, Dr. J. G. Lippman, Secretary of Agriculture Wm. B. Duryee and H. E. Taylor, through the cooperation of Pennsylvania Farmer and the American Agriculturist.

Three state poultry organizations, the New Jersey State Poultry Association, the New Jersey Record of Performance and the New Jersey Baby Chick Association, will hold meetings on Thursday. "Results of 1929 Poultry Extension Studies" will be presented by L. M. Black, Extension Poultry Specialist, and Professor Wilbur C. Thompson, head of the poultry department at the State Experiment Station, will speak on "A Basis for Selection of Hatching Eggs" at the morning meeting.

W. C. Krueger, New Jersey State specialist in Rural Electrification, will give a talk on "Electricity on the Poultry Plant," while H. S. Palmer, Poultry Specialist at the University of Delaware, will give an address on "The Poultry Industry of Our Neighbors—Delaware," at the afternoon session.

The identity of the state's "Chief Spud" and "Big Spuds" will be a feature of the meeting of the New Jersey Potato Association on Thursday. These terms, despite their implication, will not be applied to potatoes of enormous size. Instead, they will be conferred, with appropriate exercises, on the Jersey men who grew 300 or more bushels of high quality potatoes to the acre in 1929. To the man whose yields are highest will go the title, "Chief Spud," while to others who win membership in the 300-bushel club, as it is called, will go the titles, "Big Spuds."

The problem of potato production and marketing will be thoroughly discussed at this meeting. Fertilization and lime, the use of green manure crops, the question of power cultivation and other means of lowering productions will be of interest to New Jersey potato growers.

Dairymen to Meet With Alfalfa Association

All the dairy breeders' associations will meet jointly with the Alfalfa Association at a morning session on Thursday which will include addresses by Dr. H. B. Sprague, agronomist, New Jersey Agricultural Experiment Station, on "The Best Varieties of Wheat, Oats, Barley and Rye for New Jersey," Dr. T. J. Headlee, entomologist at the State Experiment Station, on "What We May Expect from the Corn Borer," while the latest development in machinery for field crops will be described by J. C. Hamilton, Julietstown; Clifford E. Snyder, Pittstown; and Professor E. R. Gross, Experiment Station.

Theodore F. Gold, of West Cornwall, Connecticut, president of the Connecticut Holstein-Friesian Association, will be the principal speaker at the meeting of the New Jersey Holstein-Friesian Association. His subject will be "Herd Sires."

The Guernsey Breeders' Association will hold its sessions, featured by the election of seven trustees, presentation of Herdmen's Cups to New Jersey dairymen, and an address on "Infectious Diseases, Its Control and Its Effect on Milk for Human Consumption," by R. Lawrence Hanson of Princeton, president of the New Jersey Jersey Breeders' Association.

C. E. Hough, secretary of the Connecticut Milk Producers' Association, will speak on "How Can Eastern Dairymen Hold His Market?" at the Dairymen's Banquet Thursday evening.

The entire program of the New Jersey State Agricultural Society on Friday will be a discussion of the importance of better grading and packing in merchandising New Jersey fruits and veg-

etables. The committee in making up this program realized that the present reputation of New Jersey fruits and vegetables on the market, and among consumers, must be improved if growers are to compete successfully with their competitors in other districts. The question of grading and packing is a serious problem in New Jersey and no grower can afford to miss this meeting.

Apiculture is an active industry in New Jersey with more than 3,000 beekeepers having approximately 32,000 colonies of bees valued at one-half million dollars. Besides the commercial apiaries in the state, it is estimated that 2,000 colonies of bees were used as pollinators in New Jersey orchards this past season. The New Jersey Beekeepers' Association, which was organized 27 years ago, is credited with the success of apiculture in the state. This organization will meet on Thursday.

A Town and Country Church Conference will be held by the New Jersey State Council of Churches on Friday at the State Street M. E. Church.

The manufacture of ice cream has become a great industry. Above is shown the pasteurizing room in a Philadelphia ice cream plant. At the left foreground, sugar is weighed and added to the cream. In the center are pasteurizing tanks. The cream is then cooled over corrugated coolers shown at the back.

Speakers of national repute, special household demonstrations, a state-wide spelling contest, tours, banquets and luncheons are among the interesting features for the rural New Jersey women who will attend women's meetings during the four days.

The program, as prepared by the women's committee of the agricultural societies of New Jersey, will open Tuesday evening, with a banquet to the wives of the delegates to the State Agricultural Convention. This will be followed by an inspection of the new State Museum with an address on "How the New Jersey State Museum Can Cooperate with the Rural Communities," by Mrs. Kathryn B. Greywacz, Curator of the Museum.

The women will attend both sessions of the Convention on Wednesday and a luncheon, at which Miss Elizabeth C. White, of New Lisbon, will speak on "Journeys in Plant Breeding." The annual banquet of the Federation of County Boards of Agriculture will be held in the evening with Mrs. Charles W. Sewell, Chairman of the Home and Community Department, American Farm Bureau Federation, as the speaker.

Many Events Scheduled for Women

The Women's Day festivities on Thursday will be held at the Stacy-Trent Hotel, with Miss Edith D. Dixon, Specialist in Child Study and Parental Education at the State Agricultural College, presiding. Dr. Caroline B. Zachry, Director of the Department of Psychology and Mental Hygiene, State Teachers' College, Upper Merion, will speak on "The Wholesome Family." The luncheon speaker will be Miss Marion Butters, Assistant Director of Extension, State Agricultural Convention.

The afternoon session will be at the Armory, where the Grange state-wide spelling contest will be held as well as a furniture finishing demonstration by Mrs. Marion C. Bell, Home Management Specialist, State Agricultural College, and a meat-cutting demonstration and discussion of cuts by a Trenton butcher. Women will also attend the dairymen's banquet in the evening. Friday's events consist of visits to the Lenox Pottery, the State

Museum and the Old Barracks, Trenton's most interesting historical spot.

Not all time will be spent in meetings, for, as in former years, a display of farm produce and the most modern farm equipment will be held in the Armory. The farm product display will include a commercial apple show, corn show, potato show, sweet potato exhibit, and a certified baby chick show.

A COOPERATIVE to purchase seed, feed and fertilizer and to sell poultry, eggs, potatoes and garden products has recently been organized by the vocational agriculture class in the Newton, New Jersey, High School. This is known as the Future Farmer Cooperative Association.

They plan to buy a carload of certified seed potatoes for use in their farm projects and if there is a surplus to sell to farmers of the community. The teacher in commenting on this newly formed organization says, "I can't tell yet how successful this organization will be, but I am sure the boys will get some good business experience out of it."

The work of this young farmers' cooperative will be interesting to follow. Undoubtedly the farm boys and girls interested in club and vocational work are better cooperators than many of their parents.

DEVELOPMENT of a broader market for Delaware farm products by keeping prospective buyers and dealers informed as to the quality and size of crops in advance of harvest is reported by Wilmer T. Derrickson, Director Delaware Bureau of Markets, in the annual report of the Delaware State Board of Agriculture, just issued. He says:

"In our effort to widen the distribution of Delaware products and thus assist in stabilizing prices, we are constantly in communication with buyers and dealers throughout the country. Before the beginning of the shipment of most of our important agricultural commodities, we send a letter to a selected list of from five hundred to fifteen hundred buyers and dealers, informing them as to the condition of the particular crop that Delaware producers are about to harvest and advising that, if they are not already connected with producers and shippers in Delaware, we will be very glad to give them the names of firms and individuals who will take care of their requirements. Delaware is the only state that does this, and the results have been very satisfactory. We have, in some cases, received replies to approximately 75 per cent of the letters sent out and our growers and shippers have advised us that through our efforts they have made satisfactory sales to buyers and dealers in markets that they had not previously been shipping to."

Mr. Derrickson reported also that "the year ending July 1, 1929, was the second year of operation of the law which was passed by the Legislature in 1927, requiring that all closed packages of apples packed in this state, and intended for sale within or without this state, must be marked or branded with the owner's name and address, the grade, the variety and the minimum size or range of sizes. This law was revised by the Legislature in 1929 and we believe is more effective now than previous to that time; however, the law has the active support of practically every grower and shipper of apples in the state and we believe that fully 95 per cent of all apples shipped in closed packages during the year ending June 30, 1929, were marked or branded in accordance therewith. This law in its final analysis only requires that the owner or shipper of apples in Delaware mark his packages in accordance with the contents thereof."

During the year under review the Delaware Bureau of Markets inspected and issued shipping point inspection certificates on 865 cars of perishables. Official shipping point inspection was also provided at two tomato canneries.

THE one-week course in flower gardening offered annually by the College of Agriculture, Rutgers University, will be given this year, beginning on February 24.

Work of the course, for which there is no tuition charge to residents of New Jersey, is planned to help any one interested in flower gardening. The subject matter considers the needs of the home owner who wishes to landscape and beautify his grounds, and also the professional gardener.

A field of dandelion. Alfalfa or clover would pay better.

Plans for a Weed Campaign

By DR. E. M. GRESS

WEEDES are an annual aggravation to the farmer. Some folks think they are a necessary evil that must be endured, hence give little or no thought to their control or extermination. Indeed, some may still believe that weeds and insect pests are sent upon us as a punishment for our wicked deeds.

Every good farmer in winter works out plans for his farm activities the coming summer. He knows what crops he is going to plant, the amount and kind of fertilizer he will apply, and variety and quality of seed he will use. But relatively few have given thought to the battle that must be waged with his enemy the weeds.

We often hear a weed defined as a plant out of place. This definition is true but not comprehensive enough. A weed is more than a plant out of place. It is, in addition, a plant so hardy that it will withstand almost any kind of adverse conditions. The ground seldom becomes too dry or too wet, and never too rich or too poor for the growth of weeds. And then, too, most weeds have ways of reproducing themselves that make them difficult to eradicate when they once get a start. They usually produce seeds in great abundance, and the most noxious have underground parts such as bulbs and hardy roots that can withstand the severest winter freezing.

Why should the farmer plan a weed campaign early in the season? First, because no other factor can at least be partially controlled which is causing so much loss as weeds are. Second, because at no other time in the year are weeds more easily killed than in the early spring when most of them are still in the seedling stage.

How do weeds cause this great loss to farmers? They rob the soil of nourishment and moisture that should go into the crop plants. Nowhere in the state is the soil so rich that any nutriment can be spared for the growth of weeds. Therefore, every bit of nourishment that goes into the weeds leaves that much less food for the growing crop plant.

In Pennsylvania our average rainfall is about 30 inches, which is scarcely enough to mature our crops. Indeed, we must conserve this moisture if we wish to secure a maximum yield. Therefore, again all the moisture that goes into the weeds is just that much less for the growing crop plant. The weeds, too, are so much more rugged and hardy than the cultivated plants that in their struggle for existence the weeds crowd out the other plants by excluding air and sunshine.

When the crop is mature and we begin to harvest the farmer suffers loss by having to do extra labor in cutting and handling the crop, to say nothing about the wear and tear on the machinery used in harvesting and threshing. When the crop is stored it may spoil, because the weeds which are usually hard to dry prevent the crop from drying sufficiently to keep it from heating and moulding. This is especially true of forage crops such as clover and hay of all kinds.

And last of all, the quality of the product is impaired and often the farmer must suffer a discount in the selling price. There is still one more way that weeds may cause loss that must not be overlooked. It is the reduction of the value of one's farm. Indeed, many farmers fail to consider this loss at all. Perhaps the value of an otherwise good farm may be lowered by thousands of dollars because of the prevalence of some noxious weed such as Canada thistle, quack grass, garlic or horse nettle. Most of the weeds that will give trouble during the summer will start from the seeds that are already in the soil.

Some of these seeds have been there for a number of years awaiting favorable conditions for germination, while most of them dropped out of last year's mature weeds. The spring sunshine and moisture will cause many of these seeds to grow very early in the spring and it is at this point that the weed is most easily killed.

A seed has sufficient food stored in it to start a new plant with a few roots and some small leaves. When this food has all been used and before the weed has begun to manufacture its own food in any large quantity a little disturbance will kill the young plant, which at this point is called a seedling. Of course, not much can be done

Canada thistles six feet tall. It would have been easy to eradicate these when they first appeared.

against the weeds in the winter wheat or in the field which is still in sod. The place to begin, however, is in the field that is to be planted in corn, oats, potatoes, or some other spring planted crop.

Much of this land was plowed last fall as every farmer knows it should have been, for various reasons which cannot be discussed here. We shall, however, mention those which are pertinent to the question which is being discussed. The roots of the old weeds were turned up to the surface where the freezing during the winter killed many of them. The weed seeds will also start to grow more quickly and more rapidly and will thus be killed by the harrowing and cultivation preparatory to planting the crop. It is, indeed, this point above

Chleery growing in oats. The farmer is going to suffer a loss in this crop.

all else which we wish to impress on the farmer. No farmer pays better returns than that given to the preparation of a good seed bed. Perhaps it is no exaggeration to say that an hour's labor in the harrowing preparatory to planting the crop will kill more weeds than a day's labor several months later when the weeds have become well established.

A battle well begun is half won is certainly true in keeping the weeds under control, but let us not quit with the battle half won; let us carry it through to the end of the summer by being vigilant and by killing the weeds when they make their first appearance, whenever that is possible and practical.

In the control of weeds prevention is much easier than extermination after they have become well established and this leads me to say that never should unclean seed be sowed or planted. Seeds that contain weed seeds are dear at any price. Therefore, be sure that your crop seeds are of the highest quality that it is possible to get, even if you must pay a good price for them.

The Selling End

SELLING farm produce is becoming more complex with each passing year. This is due largely to the fact that grading has eliminated much of the competition between commodities and transferred it to a competition of salesmanship.

In the case of potatoes, for instance, if one hundred farmers grade their potatoes with a mechanical grader the potatoes offered for sale by each of the one hundred farmers, as far as size is concerned, are so nearly alike that there is no competition between them. The grocer or consumer might just as well buy from one of these farmers as another. There might be a difference in the cooking qualities but the general public is not educated to a nice discrimination in the cooking quality of potatoes; and as far as I know, no data are available showing a wide variation of food value in potatoes grown on different types of soil or in a different climate.

It takes salesmanship to sell farm produce today. And along with salesmanship must go good equipment for giving prompt and efficient service. Today the farmer who would sell his own produce successfully and continually must develop a sales ability that will convince the merchant or ultimate consumer that the produce and the service he offers are especially superior in some particular feature. The eggs that he offers are strictly fresh, all white, clean and large. The grading of the potatoes or apples is given his personal attention. The food for the consumer's Sunday dinner have been fed and drawn in the most sanitary manner.

All through the list the special care taken to make the produce outstanding and of first grade must be noted and used as talking points for making a sale. The competition is not so much between commodities as it is in salesmanship. The best salesman is the one who can back up his sales talk with goods as represented and with courteous and regular service, is the one who gets the business.

It might be said that the farmers would be better off they would remain at home and produce and let the cooperative sell their produce for them. In fact I have heard grocerymen say that it is the farmer's business to produce. He should stay at home on the farm and let some one else do the selling. This may be all right when the market is in some distant city and the only way out is to combine the co-

Cactus and Cackles

By ALBERT LENT

IF you have ever traveled the seemingly endless desert of the Southwest, a description of this type of country is unnecessary, for it will be indelibly imprinted on your mind. If not, imagine a wide, level valley, imprisoned on all sides by serrated mountain ranges. A desert vegetation of greasewood, mesquite, palo verdes and cacti of many kinds covers the ground. Every detail of the picture denotes barrenness to eastern eyes.

In three short years a great transformation takes place. Alfalfa, fruit trees, flowers, friendly bungalows and rank after rank of chicken units have pushed back the desert and a thriving poultry colony forms an oasis. Flock after flock of White Leghorns are scratching in the warm sunshine and the comfortable homes are surrounded by gardens and flowers which flourish the year around. The man to whom this transformation must be credited is a husky Pennsylvanian from Butler county, a former student of the Pennsylvania State College, A. J. Emery, known to every one around Tucson, Arizona, as Judge Emery.

In founding this poultry colony at Emery Park, which now has its own postoffice and may be found on your new maps, he recognized several broad basic conditions which his foresight connected together and which promised success. He knew that these conditions were true:

First: Arizona was importing 165 carloads of eggs from California each year besides those coming from other states and by truck.

Second: That ideal production conditions would allow eggs to be produced as cheap or cheaper in Arizona as in the states that were supplying the market.

Third: That the number of families emigrating to the Southwest yearly for reasons of a more equable climate or for health, was increasing; that their capital as a general rule was limited and when this was used up in rent and the necessities of life, the load on the community trying to absorb them into its economic system was excessive.

Fourth: That the percentage of failures of those entering the field of commercial egg farming was heavy and was often caused by misdirection at the start.

From thirty years of experience with poultry from both the standpoint of the producer and judge, Emery had garnered and tried ideas, culled the poor and retained the best until he had devised a system, which when followed would assure success. He realized that there was a great need of some plan to establish incoming families on a sound economic basis so that they would react beneficially, not detrimentally, for the good of the community. So securing land close enough to the city in order to have all of its advantages, he adopted a slogan.

"Health, Home, Happiness and Independence," patented his system and in April 1926, began to clear the land of its desert vegetation. Unlike Horatio Alger, the trials and tribulations of the embryo colony must be passed over, for its present status proves that they were met successfully. As the present colony consists entirely of commercial egg farmers, a brief description of their two and one-half acre ranches will not be amiss. Each lot is standard size 157 1/2 feet by 600 feet deep. In the front, facing the street, is ample room for the home, lawn, shrubs, grapes and any other landscaping that is desired. The laying units, a semi-monitor type of continuous house, extend entirely along the right side of the lot. Outdoor

runs are provided with shade and water.

The potential capacity of each tract, when developed to its capacity, is 2,500 laying hens. This also allows space for the brooding of pullets for replacements, ample room to grow green feed, space for strawberry beds and vegetable plots. Alfalfa suffices for green feed nine months out of the year and barley or oats make a desirable substitute during the winter season.

The eggs are taken to a grading cellar on the day that they are laid. There they are graded and candled, each egg being weighed during the process. They are put in attractive cartons and marketed by the cooperative association which pays monthly, not only for the number produced but for the quality as well. As the attractive cream-col-

View of Judge Emery's demonstration farm.

ored truck rolls out of the grading station with its cargo of eggs, one thinks of the days when it was necessary to turn eggs in on groceries in order to sell them.

In visiting this colony and driving up and down the streets, the story of modest beginnings and constant progress is clearly reflected. The colonist is always encouraged to start modestly by putting most of his capital into the part that will pay returns. Some use a temporary type of garage or feedroom house to live in until their project is paying.

To an eastern mind, accustomed to big two-

Pullet range in young orchard.

story farm houses, the thought of living in one or two rooms is abhorrent. Here, however, it is the style, for every one lives out of doors most of the time and the winters are so mild that thick walls and heating plants are unnecessary. But modest appearance is no indication of the comfort contained in these small houses, for ingenuity has made them into real homes.

Each year finds many new farms developed in the colony, two new tracts have been opened since 1926. A new plan for developing poultry plants for non-resident owners will soon be under way. Under the ambitious plans and guidance of this transplanted Pennsylvanian, "Arizona Whites" bids fair to be the next grade of eggs listed in New York City.

Poultry production here is a specialized business, unlike that in much eastern territory, but the principles of quality production which are necessary for the existence of the industry, in the desert are likewise the means of success anywhere, as eastern poultrymen will agree.

Permanent type home.

The Rural Church

By F. M. DAY

THE rural church is an institution that will live, although changes in rural life have left many churches in barren fields. The church is a part of Christian leadership.

It is hard to bid farewell to an old church where many sacred memories have clustered about it. The old rural church has not lived in vain. The Gospel has been preached there by godly men,

souls were born into the Kingdom, and loved ones united in the holy bonds of matrimony. Many of those who have passed on were laid by the altar while the last comforting and consoling words were spoken and now rest in the shadows of the rural church, which stands as guard to their memory.

The rural church is like old homes which were once humble mansions; their walls are tumbling down and they are no longer thought of as the worshiping places of our forefathers and mothers.

Like our own lives, let us consecrate the problems of the church with the living. Various places in rural districts each family works independently on their own farms and churches and other religious matters are often much neglected.

A better system of education must be worked out before the rural churches can come back to their own. Quite a number of farm families send their children to high schools in the cities. Many such children are lost to their home communities and churches forever, yet these churches are the most productive places for evangelism. The problem is great. Most all of our city churches' membership has been increased by people moving in from the rural districts.

The rural church's contribution to the nation's life is so great we should preserve it at any rate. Any movement that helps stabilize country life will help the rural church. With the stabilization of land values we will have another generation of home-loving people in the rural districts. They will take the place of the greatest generations of people who ever lived. They will rebuild the churches of our forefathers.

I believe the time is not of a far distant future when we will witness the building of one of the greatest rural life programs of any country. Good roads, the automobile, the telephone and the radio are now common. Business men and city workers will come to live in the open country to enjoy the fragrance of the flowers, the shade of the trees, the songs of the birds and the fresh air and sunshine.

At this time of the year we have been thinking about unity and church and the birth of Christ, and the rural churches will have a large part in the program that will be rendered in the honor of the Son of God.

Beginning the New Year

AGRICULTURE enters the new year with no depressing surpluses of food products to be worked off before the planting of the 1930 crops, according to the January 1 report on the agricultural situation, issued by the Bureau of Agricultural Economics, U. S. Department of Agriculture.

Crops of the past year show an increased valuation of about \$85,000,000 over 1928, due mainly to the increased value of potatoes; and livestock sales show an increase of about \$80,000,000, practically all of which was in hogs. The most striking increase in crop values, says the Bureau, is in potatoes, in that a crop nearly one-fourth smaller than in 1928 is valued at \$170,000,000, which is approximately double the value of the 1928 production.

THEY had hardly reached the appointed place when Rose made a dramatic gesture. A pale glimmer of yellow sand was struggling up through the green of the water.

"Jump!" he ordered.

The last man was hardly clear of the rail when the Blue Heron struck. She stopped almost dead in her tracks and all her insides seemed to tear themselves loose and keep on going till they piled up in a murderous heap in her bows. Steam came out of her everywhere with shrill roaring. A half acre of yeasty water boiled around her.

Fortunately every man could swim. They cut along like fishes chased by a porpoise, with the expert Rose keeping watch over his shoulder. Presently he yelled out for them to dive. As their heads obediently disappeared the Blue Heron blew up with a thunderous report. Smoke and steam hid her from view. A rain of fragments began to plop into the water like a descending charge of shrapnel and the veil of black and white vapor lifted sluggishly, revealing the shattered, blazing hull.

Not a man had been so much as scratched and in a few minutes they were standing knee-deep on a higher elevation of the long flat. All at once Rose seemed to find something humorous in the affair. He subsided helplessly into the water roaring with laughter. He laughed like a Titan, the ripples shaking around his waist. An answering dry grin broke out on Volney's face and he too sat down and began to cackle. Toots and Rand caught the infection. The four of them rocked back and forth with merriment. The longer Hakewill's face grew the more hysterical they became.

"This may look funny to you, gentlemen," said Hakewill ruefully, "but I fail to see the joke. And in about two minutes we'll have those seiners aboard of us mad as hornets."

Rose stopped with a snort. "That's right," he said, eyeing the advancing rowboats. He got up and seized a piece of wreckage floating close at hand. It was at least six feet long and very heavy, but he brandished it as if it were a cane. "Let me conduct this seance," he said.

"No. You gentlemen aren't in this," replied Hakewill. "The fault is mine and I'll pay the damages. There won't be any row if I can help it."

"You're to blame, sir. There's nae doubt aboot it," said Volney, judicially. "And dinna trust to the law. Settle out o' court, Mr. Hakewill, settle out o' court."

They stood knee-deep in the water like five bedraggled limps while the rowboats came swiftly on. The steersman in the leading boat shook his fist at them and began to jabber fiercely. All of the men looked ugly. Hakewill raised his hand pacifically and advanced toward them.

"We're not running away," he shouted. "The boot's on the other leg. We've been run away with and lucky to get off with our lives. I trust I haven't hurt any of you men. This thing was an accident, but I'm ready to make good any damages."

"We reckon so," replied one of the rowers angrily; but it was obvious that Hakewill's speech had made an immediate and favorable impression.

"Has any one been hurt?" repeated Hakewill. The men admitted there had been no physical injuries.

"I'm mighty glad of that," said the collector. "If you gentlemen will take us over to the fleet and show me the damage I'll keep my word about paying for it."

Jack Rose had grown tired of playing second fiddle. He waded to the nearest boat and grasping the gunwale twirled it around as if it had been a child's toy. "Now you're facing the right way," he said.

At this exhibition of strength the seiners stared at him goggle-eyed. Rose gripped the stern till the boards cracked ominously. "Some of you lubbers get out," he said. "This boat's too trifling to hold a man of my weight. Afraid of wetting your feet are you?" he continued good humoredly. "All right, I'll transfer you."

He reached out and picked up two men by their waistbands, and holding them dangling in air, waded over to another boat where he gently deposited them. The seiners were as delighted as children over a conjuror's trick.

"By golly, mistah, I reckon Samson must uv been your greatgranddaddy or somethin'," laughed one of them.

"Huh! Samson would uv run like a cottontail if this gentleman had come a-foolin' round him," said another. "An' his har ain't long neither. How powerful be you, anyhow, Mistah?"

"I'll show you boys if you keep me standin' here much longer," retorted Rose.

This was the kind of repartee the seiners appreciated. They took the party aboard without further delay and as they rowed back to the fleet the men in Rose's boat were in a continual gale of hoarse merriment over his rough witticisms. Between Hakewill's square attitude and Rose's per-

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Slocum Company

Synopsis

Toots Pouche, an orphan boy with no job, spends his last dollar to rescue a dog from a fight with a captive wildcat. The boy secures employment at the Broad View Hotel, a likely place run by a southern gentleman apparently more for love than for money, since it is evidently not a paying proposition. The Colonel dies suddenly after arranging for Toots to have his library. The boy and his dog are now part of the crew on Jack Rose's craft the Stingaree.

The ship's cook, Zach, and Toots have an exciting experience in the village when Zach is mistaken for a chicken thief. Back on the ship all hands are now interested in an ancient, shelly-looking craft anchored in the harbor.

sonal magnetism they were in a state to discuss the question of damages without rancor. There was no reason why Rose and Toots should remain while these were being estimated and Rose hired two of the seiners to row them back to the Stingaree.

"I'm sorry for this piece of bad luck," he said to Hakewill, "but I guess you can count me out of the thing. Investin' in unmanageable old steamboats don't call to me with a siren's accents."

"You'll regret it when you see me at the top of a paying line," said Hakewill.

Rose was firm and they parted in a friendly way. The seineboat made the trip back to Shell Harbor in about half an hour and Rose went ashore to arrange for the delivery of some provisions. All indications pointed to fair weather for some time to come, and Toots expected that they would clear away for a long southerly run, but Rose seemed undecided when he returned.

"These calm spells are misleadin'," he said disparagingly. After an irritated glance at the sky he added rather solemnly: "All jokin' aside, Toots, that little jaunt on the Blue Heron might have

The Cheerful Plowman

CREAM CAN ON PEDESTAL

THE carrot crop may sometimes fail, the plums and parsnips too, the catmint may turn sick and pale and not be worth a sou; the roosters may contract the pip and lose their plumage and pride, the pigs may wilt and lose their zip, get blisters on their hide; the wheat on yonder wrinkled field may feel the touch of frost, the juice in oats may be congealed and all its fire be lost; but though this, that and 'tother fails, I'm here to say and swear the cream can filled from brimming pails will ease my grief and care. The barley may all shrivel up, the flax may lose its oil, the hail may mar my pointer pup, the spells may heat and boil; the corn may drop its silken beard too early in the fall, while wanton winds both wild and weird may rob my guinea stall; the buckwheat may have gripe and flu and glanders may appear to make my mule team black and blue and put it out of gear; but come what will of beastly luck to horse and hen and hare, I shall not sink into the muck while that cream can is there.

No, by the bones of Saint Jerome, Saints Patrick, Jake and Jim, and other saints in yonder home beyond the earthly rim, the man who pins his final faith to cream cans such as this, can laugh at all the devil saith, make all his arrows miss. The man who pins his hopes upon the cream can, hark to me, can trot his kiddies, Nell and John, at evening on his knee, and know those kids will always have enough of food and clothes; and that is wondrous mental saive, I'm here to tell you those.

—J. E. T.

been our last. Things like that kind of make you think o' home, eh?"

"If you have one," said Toots. The remark seemed to disconcert Rose. "Well, I guess the Stingaree's mine, in a sense," he acknowledged. "What I mean is—well, I suppose I'm a mite run down. I ought to have a rested a spell in Carrbury last time. The fact is I've about made up my mind to put back. This little trip's been expensive. Losin' ten dollars worth o' good grub, for instance. And that boy Zach's too fly. You've noticed that, haven't you?"

Toots scratched his head thoughtfully. When Rose repeated his question more insistently he was compelled to answer. "Well, I don't know as I can exactly say I've noticed it," he confessed. "Oh, you haven't. Maybe you think I'm too particular—or cranky even?" As Toots maintained his former non-committal attitude Rose exploded. "By the Great Horn Spoon, if I wasn't afraid of injurin' you for life I'd try to knock some respect and intelligence into your head. What are you sittin' round here for anyway? Why don't you see if you can sharpen yourself up by doing a little work? You might find the change agreed with you. We'll get under way for Carrbury."

Toots suspected that Rose's temper was the result of his disappointment over the Blue Heron fiasco. Rose was always keen on the make and he had been highly hopeful of the success of Hakewill's venture. The big man's ill-nature, however, was never more than skin deep. Toots gave it a chance to blow off harmlessly by keeping out of his employer's sight as much as possible during the rest of the day.

It was Zach who told him the real reason for Rose's decision when the Stingaree was almost at her home port. Toots had sought the galley for a snack. "Tain't Carrbury so much ez Missus Nesta Ham," Zach observed grinning. "Mistuh Rose am powerful stuck on de widder Ham. I reckon she'd hab him too if it warn't fo' dat sistuh, Miss Orianda. She don't tol'rate matrimony nohow. Miss Orianda. Allus did think men was brutes and Mistuh Rose the brutes' ob de lot. If I was de boss I'd hab too much 'spect fo' myself ter keep a-hangin' round."

Toots finished his sandwich of hoe-cake and molasses and went thoughtfully aft to rejoin Rose at the wheel. Here he got another shock. The big man was in high good humor owing to the proximity of the town where the widow Ham resided, but good humor did not mean reckless extravagance with Rose.

"It's likely I won't put out again for sometime," he began. "That'll practically mean tyin' up the Stingaree to her anchorage."

Toots considered this. He looked at Rose, who met his eye once and then avoided it. "I see," remarked Toots reflectively. He said no more though Rose was evidently expecting him to go on. His taciturnity seemed to irritate the big man slightly. "Well, if you understand, it's all right," he said presently. "I'd like to keep you on as a hand, but of course that would be foolish with the Stingaree lying at anchor and Zach able to do what little work's necessary."

"I THOUGHT I was hired for a certain trip," said Toots with his air of detachment.

"You must have imagined it, sonny. But don't fly off the handle before you're hurt. You're so darn quick with your rules and rights you don't give a feller a chance to finish what he's sayin'. Of course I don't mean to dump you down here for good, but you see how I'm placed, don't you? Just as soon as I'm ready to go I'll take you on again. Maybe you can get a nice little job in Carrbury. There's considerable work here for an enterprisin' young feller to pick up. Anyways I'll see you through somehow."

"All right," conceded Toots. "Your word's good enough for me, Mister Rose."

Rose went ashore when they had come to anchor off the town, leaving Toots and Zach to make everything snug. After tying his boat to the pier he walked up the street that led to the landing and entered Tigert's general store. "Well, an' how's the Capt'n?" he enquired jovially as he closed the door behind him. "What's the news since I left?"

"Hello!" exclaimed the stout proprietor, extending a floury hand across the counter. "Greetings, Jack." They shook hands and Tigert, shedding his official apron, led the way to his private cubbyhole of an office, remarking that business was about over for the day anyway.

"Business is as good as over, I suppose?"

"It's almost too good," replied Tigert. "I can hardly keep up with it, doin' most of the work as I have to. You know what help is around here. About as useful as nothin' at all. I have got a man on the delivery team, but inside the store I have to do all the waitin' on customers, book-keepin', tidyin' up an' everythin'. Slavery ain't over yet by a long shot."

(To be continued.)

The Farm Home

Out-of-Door Play Suit

"JOHNNIE! Put your coat on, or come in the house this minute!" Johnnie's coat is thrown on the ground and Johnnie is playing tag with two or three other coatless youngsters. "But, mother, my coat gets in my way. I'd much rather leave it off. Tommie's taken his off too," hopefully. But mother retorts, "You'll catch your death of cold," and forces the unwilling child to handle up again. She is right, of course, and in a measure, the child is right too. The coat is in his way. How can he be kept safe and warm out-of-doors without impeding his activities?

To meet this situation the Bureau of Home Economics has designed a number of winter play suits especially for the runabouts of preschool age, who ought to be outside as much as possible to take advantage of the short stretches of sunshine and the crisp, cold air. All of these suits are loose and roomy, and made of strong, warm materials, but all unnecessary bulk has been eliminated. Some of these suits are intended to be worn in place of an overcoat. Others, of rain-proof fabrics, take the place of a rain coat and may be worn over a similar play suit of light-weight wool or cotton.

As it is important for the child at this age to learn to dress without help, every detail of these play suits is planned to encourage self-help and independence. Front pockets are used wherever possible, and large, flat findable buttons with button-holes, or heavy cord loops. Pockets are placed at the waist line, or just below it, after careful tests made with nursery school children, to find the best location for them. At least eight different pockets have been designed, but they are all alike in one respect. The top edge flaps diagonally outward and downward.

The suit illustrated is made of paper-mill felt, a heavy wool fabric. It has all these features and several others. Notice that the ankle placket is around in front where the child can reach it, instead of on the side seam, and that the leg of the garment is shaped to get rid of bulkiness. The elastic which holds the legs down fits snug under the instep where it is out of the way and subject to least wear.

This elastic is sewn on inside the leg after the edge has been faced, because even with the best of care it will need occasional renewing. The sleeves have plenty of fullness through the elbow and are held in at the wrists by a loop and button. The patch pocket is diamond shaped to give a slanting top. Some of the suits have a square pocket with the outer corner smartly turned back. The cord which forms the loops for the buttons is carried along between the material and the facing and thus makes the edge of the suit firmer. The opening of the front extends almost the entire length to the crotch and toward the bottom of the edge is shaped out slightly to make a more secure closing. Five buttons are sufficient. A matching, close-fitting hood is worn with the suit. It has a short circular cape or collar on its lower edge to protect the neck and shoulders.

Games to Play

Spool Bubbles

ON wash days give the children a bowl of good strong soap suds and several empty spools. By dipping one end in the suds and blowing through the dry end large and lasting bubbles can be made.

Find the Word

THIS is an interesting game for older children. Send one player from the room. The others then select some word such as "can" which has several different meanings. The exiled player

is then called back into the room and given sentences, each of which must contain the word. When he finally guesses it, the player in whose sentence it was takes his place. Sample sentences would be: "I like to play ball when I can get the time." "I am looking for the boy who tied a tin can to my dog's tail." "My mother promised to can all the berries I would gather for her and now it's snowing." If the sentences are made laugh provoking they are less likely to be guessed.

Choosing Partners

A NOVEL way of selecting partners for games or a dinner is to write half of a word on a slip of card board and the other half on another slip. Only compound words should be used. As the guests pass the boxes in which the slips have been placed (one for girls and one for boys) each

draws a slip. The boys must then hunt out the girl who has the second half of the compound word. Suggested words are bird-cage, hall-tree, lamp-lighter, moving-picture, dining-room, door-way, book-case, hen-house. And a party is well started by the time John finds the rest of his fire (fire-place) and Jack having pan locates the girl who is cake (pan-cake).

L. M. T.

Know Your Business

THE sisters who were interested in budget making last April will be grateful for Mr. Zinn's article under the above heading in the issue of December 21. This is a timely topic as valuable to farm folks as to any city business or industry. Housekeeping is a business second to none in its importance to mankind. When we can measure up to all its possibilities in health, mind and character building only the best sanitariums, hospitals and colleges will be in our class.

Of course a housekeeper's budget must include many small details in its assets, and its liabilities would mean the large obligation to provide all that can minister to the health and best welfare of the family. But there is a very real gain in facing these facts and naming the obligations which we accept, precisely as there is a gain in seeing the figures that make last year's records of income and outgo for any business or industry. Naturally, the survey for this year must be adjusted to the resources of the family firm and plans for a safe margin on the right side must be made from the beginning.

But while we are lining up our business in this fashion we are getting ready to meet the question soon to be asked by the census-taker, "What is your occupation?" Then we shall say with a new pride, "I am a housekeeper." So let us read Mr. Zinn's article not only once but several times, buy a new ledger that will hold a record of at least ten years and get to work.

Because there will always be many things that we have wanted for a long time and mean to have and should have as soon as possible, our list

of actual and present necessities must come first. Our best asset, even our capital, is health, the health of all the family, and to secure this end we must have plenty of good, nourishing food and comfortable clothing. This is merely a familiar commonplace to people of experience, but experience is sometimes lacking and there are many new beginners. Let us call this survey a rule of all Big Business.

Our assets are everything we have in hand that will help meet our needs and a careful study will bring out some surprises. The farm that can furnish plenty of good milk, butter, apples, meats, vegetables, whole wheat flour and yellow corn meal has the best that money can buy. In the matter of clothing, any family of five or six persons of different ages has material that can be utilized as an asset for comfortable clothing. Everything depends on the business manager and the housekeeper is the business manager. Hepsy Neff.

Saturday Night

THE health extension specialist at a large western university tells of a woman who would never say "fail." She wanted her family to bathe in comfort but they lived on a farm, had no water in the house, and were too poor to get it.

She had a tub put right in her large kitchen, put a lid over it which was hinged to the wall at the back, and hung curtains around the three sides. When wanted, the lid is raised, and there you are. The water must be poured in, but she had a pipe built so the water will drain away and not need to be carried out. A curtain strung in wires to be drawn about the tub, a home made screen, or sending the rest of the family to the living room will insure privacy. Florence C. Hibel.

Heavy meals should be followed by light rather than rich desserts.

In rooms in material tend to run, launder in cold water and wash and dry rapidly.

Marion C. Brackin.

Health Brooder saved 95% of chicks. Blue print free.

Fewer chick deaths, faster growth with CEL-O-GLASS Health Brooders

Now bring more chicks through the "Danger Period" than you ever have before.

With CEL-O-GLASS all your chick brooding can be done indoors. Your chicks get all the benefits of outdoors with none of the dangers. You prevent such outdoor dangers as coccidiosis, worm infestation, deaths due to chilling, drowning and crowding. Indoor brooding with CEL-O-GLASS saves you the constant worry and attention associated with brooding during the windy, muddy, rainy months of early spring.

CEL-O-GLASS floods your brooder house with life-giving ultra-violet rays of sunlight which cannot penetrate ordinary glass, soiled muslin or other soiled cloth curtains. These rays promote the building of bone and body tissue, kill bacteria, prevent leg weakness, and check disease. They cause the chick's blood to manufacture Vitamin D without any additions to a normal diet.

The first 10 weeks are the danger period for chicks. Bring them through with CEL-O-GLASS

Experiment Stations and thousands of farmers everywhere are getting remarkable results with CEL-O-GLASS. You, too, can do the same thing. Just remove the glass or soiled cloth curtains from the front of your brooder and install CEL-O-GLASS frames.

If you're planning to build a new brooder, write us for blue prints. They're free. Mail the coupon below.

CEL-O-GLASS also prevents stiff legs in swine, brings disinfecting sunlight into dairy barns, eliminates bad weather breakage on cold frames, etc.

With the proper care CEL-O-GLASS lasts for years. The full story is told in this valuable 64-page book, "Health on the Farm." Write for it or check the coupon.

CEL-O-GLASS in 28" and 36" widths can be bought at hardware, lumber, seed and feed dealers in any quantity. If your local dealers cannot supply you, please write Acetol Products, Inc., 21 Spruce Street, New York.

HEXCIDE Disinfectant

Another HEX Product

POULTRY LOSSES caused by DISEASE can be reduced to a minimum by following a simple and well defined sanitary program. Start with the incubator and follow with the brooder and laying houses.

For this purpose use HEXCIDE because:

1. HEXCIDE will remain effective in contact with filth, droppings, etc. (other types of disinfectants become ineffective.)
2. HEXCIDE does not lose strength on exposure to air—one gallon mixed with water makes forty gallons of strong milky emulsion. This mixture may be used repeatedly (other types oxidize and become inert.)
3. HEXCIDE does not leave a salty deposit on metal work, is non-corrosive and will not rust metal.
4. HEXCIDE is recommended and used by large, successful poultrymen—follow their lead.

HEXCIDE may be purchased in 1 or 5 gallon cans, 30 or 50 gallon drums.

Ask your dealer for our pamphlet "Poultry Sanitation." If he cannot supply you, write to us, or ask us for it at the Madison Square Garden Show, January 13 to 19.

The Women's Market

THIS particular market is open every Saturday afternoon and operated by a number of farm ladies in a small college town. They have sold produce in the same part of the town ever since it was started several years ago but have had to change to a larger empty room several times. One person is manager and she buys all the necessary supplies such as paper plates, paper bags and all other containers, pays the bills and sees that the business is straightened up at the close of each market day.

As each lady reaches the market with her supplies she deposits them on the tables or counters and marks each article with a slip of paper containing the price and her own initials. When any one has a customer she goes with this particular person until she has finished her purchases. The saleslady takes the tags from the different articles with the money to the desk of the manager and this is kept up till everything is sold.

The manager then sorts out each lady's slips, adds the sums on a small adding machine and after deducting a small commission which each one pays as her share of the expense turns over to each member her share of the day's business. Of course each lady is anxious to contribute as much as possible to the market, for she adds a considerable sum to her income each week in this manner.

The articles brought to this market are of a very great variety. Several ladies make cottage cheese which always sells readily. They also bring milk, buttermilk, cream and butter. Eggs, dressed poultry and chicken noodles are always in demand.

One of the ladies sometimes brings as many as twelve or fourteen dressed chickens. Some have taken orders for poultry through the week and some have standing orders for one or two chickens from week to week. One lady specializes on cakes of different sorts. She and her daughter are up early in the morning to make as many as possible. One lady gets up at three o'clock on market day to get her bread, buns and rolls ready in time. Many pies are sold. One lady disposed of fifty pounds of dried corn in a few weeks. In summer fresh vegetables and fruit, as well as cut flowers, are in demand.

Some of the customers are the same who began to patronize the ladies

when the market first started. The wife of the college president comes with her basket and is a regular patron. By five o'clock generally the market is over and each woman is paid her share of the proceeds. The amount of business done at this market for almost a year amounted to nearly three thousand dollars. As the same ladies, with the exception of one who moved away, are still in the group it is proof that all are pleased with this fine outlet for their produce.

Clothing Aids Health

KEEPING fit in cold weather and avoiding colds and sore throats may depend largely on clothing. For good health, the body should be maintained at an even temperature, since both overheating and underheating are dangerous; and clothing has much to do with the temperature of the body.

Clothing is not warm nor cold in itself, but acts on the body by holding in or conducting away the body's natural warmth. Dry air is a poor conductor of heat and the air spaces in clothing, rather than the clothing itself, are what actually keep the body warm.

For this reason loose, light-weight, porous clothing is recommended for both children and adults. The garment next to the skin is especially important. Porous garments which hold air and help in the ventilation of the body are more healthful than heavy, compactly-woven underweaves. A porous union suit of cotton generally gives enough protection and is more sanitary than wool because it is easier to wash thoroughly. An underweave fabric that is too thick to let the air through is less warm than a loose fabric that holds air in the meshes. For the same reason too light-weight garments, such as a sweater and a light coat, are often warmer than one heavy one.

Too little clothing wastes the heat of the body; but too much is enervating, for it increases perspiration and a subsequent evaporation may cause a feeling of chill.

Shoes, overshoes and hose are also important for good health. Shoes may be light indoors but for outside wear the feet should be well-protected from cold and dampness. Children's knees should be well protected in winter.

Timely Tips

WORN out bath robes and flannellette gowns or kimonoas that are no longer fit for wear may be used for several household helpers. Out of the largest pieces make roll-ups and covers for the extra silverware. With the freshest looking parts, make covers for the hot water bags and bottles so much needed in cold weather. Do you know they stay hot longer if covered?

You can also make warm bed socks or shoes so comfortable to older folks during winter months. Any remaining pieces always make fine polishing cloths—whether silver, furniture or even shoes are considered.

I have the most fun making jelly right in mid-winter. I am not so hurried as in summer, there are no flies to bother me, and the fragrance in the house is so enticing. Here is a popular with children and mother alike. It is more laxative and more agreeable to take than the "gar-coated" pill.

Use one pound each of figs, prunes, dates, raisins and sugar. Also one cup cherries, two cups water and two pounds walnut meats. Stone the prunes and dates, then chop the figs into small pieces. Boil together the fruits, sugar and water for one and one-half hours over a slow heat. Add the drained cherries and nuts and boil five minutes longer. Pour into hot clean jelly glasses and seal.

Mrs. C. C. Garey.

Nest Box Notes

By R. L. SCHARRING-HAUSEN

THE other day a number of poultrymen in my neighborhood made up a little party and we drove some 80 miles to Vineland where a heavy correspondence is handled.

UT in the incubator rooms I was especially interested in a battery of seventeen 12,000-egg all-electric incubators which were just being set up, as they were of the same make as the one I have just purchased. There is an interesting story connected with the purchase of these incubators, which take the place of old equipment. Last year the owner, during the season found that it hatching a greater percentage of chicks than did the incubators he was using, and at the same time required a minimum of attention and labor. After some figuring, it proved profitable to replace the hot-water long incubators with the all electric incubators, so the change was made during the fall in time to start this season's hatching.

OME of the party, who are in the broiler and capon business, found great deal to see in the battery room, where 11,000 chicks were started, a short but busy life which is to terminate over the coals a few months hence. This battery room is a padded affair, specially heated and ventilated, with the chicks in tiers from floor to head-high.

Any phase of farming is headed toward the big-business, mass production idea it certainly is the hatching of chickens in these big incubators and the raising of them for part of all of their lives in batteries.

SMALLER battery room connected with the chick packing was the product of another company, but worked along similar lines. During the hatching season a great many transient and unexpected customers come in for small orders of chicks, and this smaller battery is for storage purposes to meet this demand, which sometimes takes several thousand chicks over a week end.

HIS hatchery is specializing on two crosses for broiler, roaster and capon purposes. One is a White Rock-Brahma cross, and the other is a White Rock-White Wyandotte cross. These crosses are made each year by pure-bred males to pure-bred female flocks, and the chicks from these crosses are considered by many to be superior in every way to pure-bred chicks for meat purposes.

One experiment of using Cornish was once tried, but the result was a hard-meated bird inferior for table purposes to soft-meated birds from the other crosses.

AFTER going through the hatchery, we inspected several outcrops of White Leghorns in the neighborhood which helped to supply the hatchery eggs. These flocks, under state inspection, had been tested, and were headed by pedigree males, insuring the purchaser of high quality of chick. Lack of time prevented us from seeing flocks of other breeds, which, however, are of some high quality.

492 out of 500 with Eshelman

M. L. DERSTINE of Harleysville, Pa., raised two pens of Rhode Island Red Chicks. He fed nothing but Eshelman Feed—and raised 492 out of 500—98%. No wonder he's one of the many men who say "I'll stick to Eshelman." You'll say the same after you've had similar results.

Every Eshelman Feed has the record of such results: Chick Starter, Chick Feed, Intermediate Chick Feed, Growing Mash, Fattening Mash, Scratch Feed, Laying Mash. Put your flock on a 98% profit basis with Eshelman—like Mr. Derstine did.

JOHN W. Eshelman & SONS
ESTABLISHED 1842
LANCASTER, PA.

Since 1842 four generations of the Eshelman family have been in the feed business. Located in Lancaster County, one of the richest farming counties of the country, the men who make Eshelman feed for you are most of them farm-raised. They bring a knowledge, an interest, a pride to their work—which produces better feed.

Eshelman
GUARANTEED FEED

for cows, calves, steers, hogs, horses, pigeons and poultry

Eshelman
LAYING MASH

Rich in protein and carbohydrates. Hens clean it up because of its appetizing flavor. Has produced unusual records.

Eshelman
GOLDEN ROD 25

A high grade, high protein, dairy ration, without molasses. Palatable and highly digestible. Especially well adapted for use with low grade roughage.

Eshelman
SCRATCH FEED

An excellent grain supplement for the laying mash. Scatter in litter and make the birds work for it.

There is an Eshelman Guaranteed Feed to meet every feeding requirement of live-stock and poultry—backed by 87 years' experience—made of only the finest materials—economical.

Experience with Poultry

By JEANETTA P. NORTON

I STARTED my poultry in a blundering sort of way. I didn't know a thing about chickens. I'd never lived on a farm until my brother John and I came out of Baltimore fifteen years ago. My family for generations back have been farmers, my father was a Maryland tobacco planter, but I was city raised.

John had been raising pure-bred English Yorkshires for seven years when I took the poultry fever and bought my first fifty hens. That was eight years ago. It took me three years to convince my brother that White Leghorn chickens can make twice as much money as white hogs. He sold the hogs and turned the lots into chicken pens.

I didn't intend to do more than have a small flock and buy part of our groceries with the eggs. But I hadn't been at it a year until I got interested in the marketing end.

Market Preference

My first hens were Barred Rocks. I bought a 50-egg incubator and started to learn how to hatch eggs. That first incubator ran a temperature from 40 to 120 degrees. The little brown book of instructions said to expose the eggs to the air one minute for every degree over normal temperature. I had the top off more minutes than I had it on. Some nights I sat up straight through until morning cooling the eggs and heating them up again. But luck was with me. Almost every egg was hatched. I realized so many pullets I had to think up a way to sell the eggs.

Our farm is only 25 miles out of Baltimore. Why not a direct-by-mail market? I interviewed the buyer of the best fancy grocery in the city. He was interested until I told him that my chickens were Barred Rocks. Brown eggs—and the deal was off. There I learned my first lesson—eggs must be white to sell at fancy prices in Baltimore. He offered me the wholesale price, plus 20 per cent, for all the white eggs I could produce.

I sold my flock and started over again with White Leghorns. I added a 150-egg incubator and two outdoor brooders. One of these I made myself with a big drygoods box, a hotbed sash and a heater. That home-made brooder brought my first tears. It was a hot day in May. The sun beat down on the glass cover. The oil lamp kept on doing its best. I went out to feed my first hatch. There they were stretched out—120 baked chickens—with the brooder temperature soaring at 185 degrees.

A Proud Day

The first year with my White Leghorns I averaged 105 eggs to the bird. I should have done better, but I didn't know a thing about feeding—just fed anything I got my hands on. Lack of equipment was another handicap.

Again I went into Baltimore, this time with sample dozens of my white eggs, to visit a lunch-room. To my surprise I sold them on the idea of quality eggs shipped in three times a week from our farm. That was the proudest day of my life.

From then on I was a business woman. I can remember yet the novelty of reading the daily market quotations. It pays to read them too. My selling price was to be five cents above the price of extras on South Hail Street. In making out my checks the purchasing steward used quotations issued by the United States Bureau of Markets. This is the average price for the leading markets and it is usually from five to eight cents lower than the local price. Keeping up on the markets saved me an extra \$4 or \$5 a week.

In the third year of my venture I added two more lunch rooms as regular buyers. This time when I called

to present my plan I took with me sample case of eggs and left me to trial. The next week I came again. Both lunch rooms gave me for more. They liked my eggs so much that in five weeks they were paying me ten cents a dozen over wholesale prices.

The Hardest Work

With a demand for more eggs in my flock could furnish it was up to me to increase production. I began feeding for eggs. I had been feeding almost all grain, only a little meal and that without animal protein. I rationed called for 100 pounds of meal, 100 pounds of shorts and 60 pounds of tankage. In the winter we add per cent of corn meal.

Our grain mixture the year around is 100 pounds of corn, 100 pounds wheat and 50 pounds of oats. This always fed in the litter. We use rape and stock beets to supply salad in the diet. Cabbage, too, one of our favorite greens. On ration I brought the hens up to 144-egg average in two years. Last year the average production per hen was 160 eggs.

My hardest work comes during brooding season. I often have eggs incubating at a time and temper gets particularly ruffled when a city friend says, "Chickens—a lovely thing to raise!"

I like raising chickens or I would be doing it, but I don't think being a poultry woman is a snap job. During the brooding season I'm up every morning at five. Some years I'm from six to eight pounds during the weeks. Last spring I hatched 120 chicks for our own flocks. I hatch any later than the last week in May.

We keep very close accounts, costs us \$2 a year to feed a hen, a net profit averages between \$3 and a bird. During March, April, May and June we average a lay of about 100 per cent production. In the winter get around 50 per cent production. From October to April we use artificial lights, switched on by the clock system.

A Quality Product

The eggs are gathered twice a year round and three and a half times in the winter. Every egg is graded according to size and is candied against blood spots before it is shipped. Our shipment express go out three times each week.

There have been times when I've solved to sell every chicken and egg. One morning, a year ago, my brother and the hand drove to the city and left me alone with the farm. I was one of the laying houses when door slammed and locked. I had get out to take care of the chickens and watch the incubators meant the loss of a good many lars if I stayed locked in for the night.

There was one tiny door, ten by square, not more than five feet to the ground. After an hour of huffing for a toe hold I kicked down the door. Each kick shot up my temper and degree. And I blamed it all on chickens.

I made \$4,300 net profit last year on 1,500 hens and pullets. They are served only in Baltimore and rooms. Sometimes I sell 5,000 a week—more than sixty dozens a day—at eight to ten cents a dozen at the top market price.

Restaurant trade isn't easy to and, once you get it, keeping it still another thing. I do it by personal contact and a quality product. Strictly fresh, absolutely clean, white—that's what restaurants of an egg. One bad egg and you dropped from the list.

Animal Protein

Since the baby chick for several days feeds on the egg contents, it is imperative that the breeding stock be fed a ration rich in the elements required by the chick. It has been rather definitely established that several sources of animal protein products are to be preferred to one. For that reason milk, fish meal and meat scraps are a part of all breeding, laying and chick rations used on the poultry farm at the Pennsylvania State College.

Since tender, juicy green food is difficult to obtain during the winter months, alfalfa leaf meal has been added to the ration for breeding hens at the rate of ten pounds in each 100 pounds of mash. One pound of cod-liver oil in each 100 pounds of mash is fed to all stock of all ages. There is a firm conviction in the minds of some that the use of cod-liver oil in the ration for laying fowls, materially aids in the structure and appearance of the egg shell. A strong egg shell is essential for hatching purposes. The other principal ingredients in the ration may be yellow cornmeal, wheat bran, wheat middlings and ground oats.

Management of Breeding Stock

By H. C. KNADEL

THIS is the season when one should be laying plans for the 1930 chick crop. This crop is primarily dependent on the condition of the breeding flock. It is to be supposed that the hens were severely culled last fall and only the late molting, vigorous individuals are to be used as breeders. To these should be mated a male with a known pedigree. Of course, pedigrees are often misleading. Of greater importance than a high pedigree is a family tree which is consistent.

This morning I spent some time in the examination of the egg-laying records of pullets which were hatched during the season of 1929. It was not difficult to find Barred Rock pullets which had laid 100 eggs in four months, but it was some task to find a hen which had ten offspring or more that as pullets in four months have laid 100 eggs.

Individual high egg production may not mean very much. If, however, a family is found in which all offspring are of good quality though the egg production of no one individual may be extremely high, as breeders such individuals are to be preferred. Hence, it is a good plan when purchasing breeding males to be sure that they have firmly fixed the desired traits which you consider important.

Change in Management

During the past few years the management of breeding stock, so that it will produce eggs when most needed, has changed considerably. This change has been made necessary because of the fact that chicks are being hatched earlier than before. Commercial poultrymen have discovered that the February and March hatched chicks are less liable to serious infection from coccidiosis. Furthermore, intestinal parasites are less liable to attack early than late hatched chicks since these organisms do not get steam ahead until the warm days of spring and summer.

In addition to the above reasons, high egg prices have moved toward the early fall months. Thus a group of chicks hatched in February or March will start to lay in July and August and continue perhaps throughout the season without a molt. Even though a molt does occur, the eggs previously laid will, because of high prices, be profitably produced.

The use of artificial light as a means of hurrying the fall molt of hens is now considered good practice. Breeding hens, which are to be called on to produce early hatching eggs, should now be under lights. If morning lights are used, they should not be turned on earlier than 4:30 a. m.

Colds or Bronchitis

I have a flock of White Leghorn hens which seem to cough and breathe with difficulty. Sometimes their eyes go shut. They lose weight and finally die.

YOUR fowls are unquestionably affected with colds or bronchitis. Colds, of course, may develop into bronchitis, roup and canker. It would be well first to remove the affected birds from the rest of the flock and place them in a building by themselves. As soon as other cases develop they likewise should be removed. All drafts which strike directly on the birds should be eliminated. It will be necessary to change the litter frequently in order that the fowls are not compelled to work or stand in wet litter. Probably the use of potassium permanganate in the drinking water will be desirable. Enough should be used to make the water a purple color.

As an individual treatment for the birds affected, I would suggest that you use cressatin, which is a coal-tar derivative. One small drop of the substance is put into the windpipe of the fowl. This causes the bird to choke for a moment and then cough out a long, stringy mass of pus and blood. Relief is noticeable immediately. The throat and mouth may be sprayed with cressatin in an atomizer. Usually one or two drops are sufficient.

It is a good plan to place more breeding males into the pen than are actually required. For instance, in a pen of 100 Leghorn hens eight males may be used. Four are allowed on the floor each day. By alternating the males in this manner, better fertility and hatchability are secured. Then, too, less scrapping is liable to occur, and though a male may go down for the count of ten, there is a sufficient number left to carry on.

Heated Houses

Will it do any harm to laying pullets to heat the coop during cold weather? During the present cold spell they have decreased about eight per cent in egg production. What will be the best way to heat a coop, steam, hot water or coal stoves?

AT the present time several experimental stations and numerous commercial concerns are investigating the advisability of heating houses for laying hens. As yet no conclusive evidence has been presented which demonstrates the proper room temperature for mature fowls. Certain poultrymen who have been experimenting with heated poultry houses claim that an average temperature of 40 degrees during the winter months is advisable.

Hot water heat would maintain a more even temperature than steam or hot air from coal stoves. Care should be taken not to over-heat the house.

Chronic Coccidiosis

What is wrong with my chickens? I have 125 Plymouth Rock pullets. They get lame in one leg and in a day or two their backs are affected so they cannot walk. Droppings are thin and of a yellowish color.

A DISEASE similar to that affecting your flock is common throughout the entire country. Birds, which as growing stock were affected with coccidiosis, when mature develop a chronic form of this disease. It is indeed difficult to cure the chronic form and we have no suggestions to offer other than to eliminate from the flock all affected birds and rigidly cull each week.

The use of Epsom salts once in two weeks at the rate of one pound per hundred adult fowls is probably advisable. The use of enteritis powder has given some satisfaction. H. C. K.

Colds or Bronchitis

I have a flock of White Leghorn hens which seem to cough and breathe with difficulty. Sometimes their eyes go shut. They lose weight and finally die.

YOUR fowls are unquestionably affected with colds or bronchitis. Colds, of course, may develop into bronchitis, roup and canker. It would be well first to remove the affected birds from the rest of the flock and place them in a building by themselves. As soon as other cases develop they likewise should be removed. All drafts which strike directly on the birds should be eliminated. It will be necessary to change the litter frequently in order that the fowls are not compelled to work or stand in wet litter. Probably the use of potassium permanganate in the drinking water will be desirable. Enough should be used to make the water a purple color.

As an individual treatment for the birds affected, I would suggest that you use cressatin, which is a coal-tar derivative. One small drop of the substance is put into the windpipe of the fowl. Hens Do Their Very Best on this great oatmeal feed

THERE seems to be something about oatmeal that makes hens go to work in earnest. Not just oatmeal, but oatmeal as it is combined with other purposeful ingredients in Quaker Ful-O-Pep Egg Mash.

At any rate, time after time, the ability of this great oatmeal feed to speed up egg production is proved by unbiased feeders. We know it's the very best egg ration that all the resources of The Quaker Oats Company can produce, but the hens themselves deliver the proof.

Why not put your flock on this profitable mash? No time like the present, for in addition to providing you with an increase in eggs, Quaker Ful-O-Pep Egg Mash will help you to get the best hatching eggs, the sturdiest baby chicks

And it's easy to use. Easy to get, too—just see the Quaker Dealer in your neighborhood. Ask about Quaker Ful-O-Pep Chick Starter, and Scratch Grains, too. SEND THE COUPON below today if you want some interesting information.

Our Neighbors From Europe

(Continued from page 5.)

realization of the privileges and opportunities that Americans enjoy, than we who take such things for granted can possibly understand. Surely fertile soil of this kind should have made assimilation easy.

How has the American, the typical farm owner of British or German descent, risen to this evident challenge to his belief in the doctrines that make our country more desirable than any of the older nations as a home? Did he welcome his new neighbor, and make an effort to transfer to the alien-born his own democratic conception of what was great and valuable and worthwhile in our national body politics? Have our farm organizations, our rural women's clubs and kindred societies given any continued thought to this most pressing problem present in more or less degree in practically every one of their communities?

Sad to state the evidence is against them. Go into any of these invaded sections where for several years the two groups have lived side by side. Has any progress in assimilation been made? In most cases there exists a very definite line of division. On one side you will find the "foreign element" and on the other everybody else who may consider himself superior socially, or ancestrally, to these newcomers.

The Language We Speak

Resentment is shown toward the late arrivals as a class, to their standards of sanitation and of living, and their old world instinct to barter in trade. The charge is often made that they are filthy and vulgar in their talk, but here again are differences in standards to be reckoned with, and it must, in order to form anything like a fair judgment, be remembered that the language they speak is not their own, and that their knowledge of it has come only through contact. It should make any self-respecting American blush with shame to know that often a foreigner's entire vocabulary has been acquired from sources that make it a lifetime handicap to him.

Before this influx of foreign born into our established farming communities, any social divisions to be found there were mostly a matter of difference in religious belief. If two or more churches were supported, each had its group of followers, who were apt to be antagonistic toward the members of any other group. This condition has always stood in the way of the fullest development of community life and cooperation. Add to this religious grouping another element of division, that of national origin, and your local problem of schools and administration have vastly increased.

To one who loves his country, not loudly nor perhaps even patriotically, in the common conception of patriotism, but deeply and passionately, conscious of qualities in our national structure that have made for greatness, cognizant of the fact that it is these same qualities permeating our national life that have enabled us as a people to reach a common height of human happiness and welfare superior to any other in the entire world, the presence of this threat to the very heartstones of the nation, the farming communities, must surely give the gravest concern. It should not be passed over lightly with the usual thought of "Let George tend to that." "George" is a busy fellow and may neglect it entirely.

A Far Cry

Let every individual and organization in districts where investigation reveals that the birthright citizen has neglected his duty to his foreign-born brother, take stock of their possibilities, work up a real live interest in the problem and press for its solution.

Remember that the solution must of necessity require a long time and will be largely a matter of example and association, a transferring of the things that we have found good about America to these later comers, so that they may find them good also.

Get away from the "holier than thou" spirit, or rather the "more American than thou" spirit. Give the neighbor credit for the progress he has already made. To do this you must know the background from which he has come. In many instances an immigrant family has made more worthwhile progress in the course of a few years than our own could show in several generations.

It is a very far cry from a dirt-floored Volhynian peasant hut to an American farm home, and that our immigrants have reacted so marvelously to the stimulus of American example should give high hope for the future.

Where Did the Money Go?

TIME to make your 1930 budget—but before you can do that intelligently 1929 must be reckoned with. Unless you have an accurate idea of what you spent this past year for each group of goods and services the family uses—food, clothing, housing, running expenses and so on, you cannot tell how much to allow for those items next year. Making a summary is both a mental and a moral exercise, for as you proceed with it you are at times overwhelmed with the way certain kinds of expense have played havoc with whatever plan you made at the beginning of 1929.

If you have had one of the account books or "Record of Family Expenditure" designed by the Bureau of Home Economics of the United States Department of Agriculture, it will not be necessary to tell you how to make a summary. A double page is provided for this purpose, corresponding to the estimate for the year, and if the book was properly kept, all the entries have been made. All you have to do is to add them up and compare the totals with what you planned to spend under each classification. Then you are ready to plan your new budget, using this record as a guide.

If you did not have one of these account books, by all means get one for 1930. Send fifty cents in coin or postal order (not stamps) to the Superintendent of Documents of the Government Printing Office, Washington, D. C. Go over your accounts for the past year, if you kept any, and classify the items as far as you can. It will mean a great deal more work to do this with haphazard accounts than to summarize well-kept records, but unless you do it, your next budget will be largely guesswork.

Perhaps you can find out from your summary whether or not your methods of buying food are economical, whether you have spent an undue amount for help in tasks you might have done yourself, or whether, if you had better equipment, the cost of some things could be reduced. Your summary should tell you how much has been spent for clothes by each member of the family, and, by checking over the items, you can see which of the larger expenditures, such as suits and coats, will not be necessary in the year to come.

Erie County Layers

A PEN of ten birds entered by the Toivonen Leghorn Farms of Erie county in the 19th Annual International Egg-Laying Contest, conducted at Storrs, Connecticut, has jumped into the lead among the White Leghorns in that contest. They produced 349 eggs during the first six weeks

Look! Look!....it rises twice.. ...not once

It's wonderful how CALUMET'S DOUBLE-ACTION makes all your baking better

MAKE THIS TEST—Naturally, when baking, you can't see how Calumet's Double-Action works inside the dough or batter to make it rise. But, by making this simple demonstration with only baking powder and water in a glass, you can see clearly how baking powder acts—and how Calumet acts twice to make your baking better.

Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The rising fine bubbles will rise slowly, half filling the glass. This is Calumet's first action—the action that takes place in the mixing bowl when you add liquid to your dry ingredients.

After the mixture has entirely stopped rising, stand the glass in a pan of hot water on the stove. In a moment a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's second action—the action that takes place in the heat of your oven.

Make this test. See Calumet's Double-Action which protects your baking from failure.

Perhaps you have heard people tell of the wonderful "luck" they always have with Calumet. It is Calumet's Double-Action that causes that "luck." Two leavening actions—not merely one. The astonishing test described on this page will show you Calumet's Double-Action.

In baking, Calumet's first action takes place when you add the liquid to the dry ingredients. Then, when you put the batter into the oven, the second leavening action begins, swells through the batter and makes your baking rise beautifully—even though you may not be able to regulate your oven temperature perfectly.

When women have pulled one perfect Calumet cake after another out of their ovens... when they have found that biscuits which used to be only pretty good, are simply delicious when made with Calumet... they naturally tell their friends. That's why Calumet is now the largest selling baking powder in the world.

All baking powders are required by law to be made of pure, wholesome ingredients. But not all baking powders are alike in their action. Not all can give you equally fine results in your baking. Calumet is scientifically made of exactly the right ingredients, in exactly the right proportions to produce perfect leavening action—Double-Action—your surety of perfect baking results.

Be sure you get some muffins by the easy recipe on this page, and see what fine results you get. Notice that the recipe calls for only one level teaspoon of Calumet to each cup of sifted flour. This is the ideal Calumet proportion and should be followed for best results—a real economy, too. Send the coupon and Marion Jane Parker will send you the new Calumet Baking Book—free. A collection of splendid up-to-date recipes prepared by baking experts.

A RECIPE FOR CALUMET MUFFINS

2 cups sifted flour
2 teaspoons Calumet Baking Powder
2 tablespoons sugar
1/2 teaspoon salt

1 egg, well beaten
1 cup milk
4 tablespoons melted butter or other shortening

With one hand, add baking powder, sugar, and salt, and mix well. With the other hand, add milk and egg, and mix gradually, beating six or eight times. Bake in greased muffin pan. Bake for 20 minutes at 375° F. (7° F. over medium heat).

Hiking from California to Maine

How far do farmers walk in caring for their cows?

In three months, according to a check made by the University of Wisconsin, 100 farmers with an average of 27 cows apiece, hiked a total of 3,500 miles—just in feeding and cleaning chores for cows, in stalls only!

That will give you some idea of the distance you're walking every day on your farm. And human feet, remember, are one means of locomotion for which you can't buy spare parts anywhere!

So give your feet all the ease and comfort you can. Thousands of foot-careful farmers from California to Maine find the maximum of comfort surely and economically from "U. S." Blue Rib-

bon Footwear. For the United States Rubber Company has built the "U. S." Blue Ribbon line not only to wear and wear and wear—but, above all, to give long-lasting, foot-saving comfort.

See it—wear it, the 44-part Boot!

Rubber boots may look like simple things to make. But not this "U. S." Blue Ribbon Boot. It is made of 44 distinct parts—all fashioned together with such skilful workmanship that one day in them will prove that they're the most comfortable boots you've ever slipped your feet into.

This 44-part boot is made over a specially designed last so as to assure perfect, exact fit for any but abnormal

feet. There is a shape-in effect between heel and ankle. This special shaping of the boot, plus the rocking chair curve in the sole, and the square flat heel gives you a springy, "carry-through" stride that spares your strength.

A set of bracing rubber ribs extend down over the front of this "U. S." Blue Ribbon Boot, so that it won't buckle over the instep and press on the big veins of the feet.

Every feature of the "U. S." Blue Ribbon Boot is the result of years of experience and effort to build the most comfortable rubber footwear it is possible to make. There's a type of "U. S." Blue Ribbon Heavy Footwear for every member of the family.

1. A Family Rubber Line

All the family can have "U. S." Rubbers—men, women and children—high-cut, storm, foot-hugging, heavy service or dress.

2. This "U. S." Blue Ribbon Boot

is built to wear long—and comfortably. Used by farmers everywhere.

"U.S."

BLUE RIBBON

foot-saving heavy footwear

6. Keds for Swift-footed Children!

Full protection for young feet—yet barefoot freedom in Keds, the most popular boys' and girls' shoes in America. Neat—smart-looking. Made only by the United States Rubber Company.

3. Neat, Sturdy Arctics

There is extra warmth in the fleece lining of these neat-looking, long-wearing "U. S." Arctics. Fine quality cashmere upper. In red soles or Ebony with white soles. 4- or 5-buckle lengths.

4. In addition the "U. S." Blue Ribbon Walrus (all-rubber arctic) is a most useful shoe. It slips right over your leather shoes, kicks off in a jiffy, washes clean like a boot. Gray soles, red uppers, 4 or 5 buckles.

5. A Tip to Farmers' Wives

You'll not only find comfort and wear—but style, too, in these Gaytees for town and neighborly calls. "Gaytees" is the trademarked name of these stylish, tailored overshoes made only by the United States Rubber Company. Gaytees come in cloth or all rubber—in high or low height with Snap fastener, Kwik-glide fastener, or 4 buckles.

FREE BOOK!

The Care of Farmers' Feet

Combined with a beautiful history-calendar. Get the new free book on foot health written by Dr. Joseph Lelyveld, Director of the National Association of Foot Health—combined with a beautiful history-calendar. Dr. Lelyveld discusses such problems as bunions, corns, ingrown nails, chilblains, callouses, fallen arches, how to care for itching feet, and many precautions that lead to health and comfort. He also tells how to greatly increase the life of your rubber footwear by following a few simple rules. Address United States Rubber Company, Dept. FFF-10, 1790 Broadway, New York.

IN THE GREAT FARMING CENTERS AS IN THE CITIES

People buy from two to five times as many new Buicks as any other car in Buick's field!

When the man from the farm and the man from the city get together and start talking automobiles, both discover an interesting fact. And here it is:

In agricultural America, as in industrial America, people favor BUICK so strongly that they buy from two to five times as many new Buicks as any other car in its field. In fact, during August and September of this year, public preference for Buick ran so high that Buick won 41% of the total sales of all cars in its price class. Month after month, demand for Buick has surpassed the demand for any other car in its field by the widest margin in Buick history.

When the man from the farm and the man from the city start naming the reasons they favor Buick so strongly, both arrive at the same conclusion.

Never before in motor car history has it been possible to get such outstanding value as in the new Buick for 1930. Never before has Buick revealed such clear-cut superiority over its field in all elements of performance, appearance, stamina and reliability. And never before have motorists found Buick cars available at such remarkably attractive prices.

Only Buick's tremendous manufacturing resources and overwhelming sales leadership make it possible, for example, to offer six of the fourteen luxurious Buick body types at prices under \$1300. f. o. b. factory. This is all the more apparent when you realize that the new Buick combines such outstanding features as:

Buick's great new Valve-in-Head engine—developing 80½ horsepower in the 118-inch series and 99 horsepower in the 124 and 132-inch series—achieving the very perfection of performance, with improved economy.

Buick's beautiful new low-swung Bodies by Fisher, handsomely finished and appointed, incorporating such remarkable advancements as waterproof, wearproof, dustproof upholstery; new Non-Glare Windshield; adjustable front seat and adjustable steering column.

Buick's new Controlled Servo Enclosed Mechanical Brakes; new frictionless steering gear and new Road Shock Eliminator; new, longer rear springs with Lovejoy Duodraulic Shock Absorbers; and many other advanced features.

The new Buick models for 1930 are unrivaled values. Feature for feature and dollar for dollar, they represent

more motor car for the money than even Buick has ever offered before. These are strong statements, but they are true statements, and Buick is eager to have you prove them to your own satisfaction.

See the new Buicks. Drive them. Make a feature-by-feature comparison with any other car anywhere near the Buick price. Then you'll know why men and women on the farms, in small communities and in large cities alike are buying from two to five times as many Buicks as any other car in its field. Then you, too, will decide to make Buick your choice.

January 11, 1930

Engineering

Basement Wall

A SUBSCRIBER WRITES about a basement wall for his home, stating that he is planning on a thickness of only five inches of concrete. So far as strength is concerned, a thickness of five inches of the very highest grade of concrete wall reinforced with steel would probably be sufficient to carry the weight of a single story, frame house under all ordinary conditions; and still it cannot be considered safe or satisfactory basement wall construction.

But the average farmer or the average small contractor does not make a wall of the very highest grade of concrete. He is much more likely to try to save a little on the quantity of cement, to use bank-run gravel rather than to screen it out into sand and coarse gravel and then recombine it in the proper proportion, to assume that the sand and gravel are clean when they actually may contain enough clay or silt to injure the quality of the concrete, to use too much water because the sloppy mixture is more easily handled, and the neglect of the daily sprinkling which is essential to good curing. Hence there will nearly always be spots in such a wall that are neither of full strength nor full waterproof.

Hence, most of the building codes specify eight inches as the minimum thickness for a foundation wall even for a single story house; and for large barns and two-story houses, 10 and 12-inch walls are none too heavy. The small saving in the cost of the cement used hardly pays for the much greater care required for building forms and putting in reinforcing and the possibility that the thinner wall may fail to be waterproof when finished.

Cayenne Pepper in Oil

A subscriber recently inquired for some remedy for preventing mice from gnawing his harness. I have had fair success along this line by mixing cayenne pepper with the oil when greasing the harness, using enough to make it pretty hot. I hope this may be helpful to other readers.

C. S. C.

THIS is an entirely new suggestion, and it would seem that there might be some merit to its use. Although our reader does not say how much pepper to use, I would judge that a tablespoonful to about a quart of oil would not be far off, and what oil was left over from this would be just as effective the next year.

A great many of our readers have found that salt put on the barn timbers in the neighborhood of the harness is a good preventive, the mice apparently nibbling the salt in preference to the harness. Several have found that mice have a marked dislike to pine tar and that if it is smeared on the posts and timbers above and below the harness there will be no trouble from the mice gnawing the harness.

I. W. D.

To Clean A Vinegar Barrel

Would like to know how a vinegar barrel could be prepared so it could be used for curing meat in brine. D. S.

USUALLY very little cleaning is considered in the case of a vinegar barrel, other than to let it stand several days full of water, let the inside dry out, then burn a few handfuls of excelsior or shavings or dry straw in it, then scald thoroughly with boiling hot water.

Any of our readers planning on killing and curing farm meat should by all means write to the U. S. Department of Agriculture, Washington, D. C., and to their own and one or two neighboring agricultural colleges for free bulletins on the subject.

ONLY A TEAM OR TWO FOR THE ODD JOBS ~ ~ That's All You Need With A JOHN DEERE GENERAL PURPOSE

When one man with his John Deere General Purpose Tractor plants from 30 to 40 acres a day, cultivates 25 to 40 acres, mows from 25 to 35 acres, plows at the rate of about an acre an hour, disks, hoes, harvests, threshes, picks corn, does all the major field and belt jobs with this equipment the need for horses fades from the farming program.

Only a team is needed on the average size of farm for the odd jobs—two at the most on the larger farms. No tractor does more in reducing the number of horses.

Spencer Plumb of Hudson, Illinois planted and cultivated 175 acres of corn with his John Deere General Purpose. He has but one team on his half-section farm.

"It would take 16 to 20 head of horses and four men to handle my 450 acres, 230 of which

are in corn," says, Fred Parks of Minonk, Illinois. "With my John Deere General Purpose and another 3-plow tractor two men do all the work."

Besides the big reduction in horses, consider the labor bill that is saved by this fast-working, efficient equipment. When you can save one to three men during the crop season at around \$60 a month, not including board, you are plugging up a big hole in your bank account—this money is saved by General Purpose users.

On the larger row-crop farms where plowing, disking, threshing and other heavier work requires larger capacity in order to effect maximum economies, the John Deere Model D 3-4 Plow Tractor can be profitably used in combination with the John Deere General Purpose.

INVESTIGATE NOW

Here is power equipment worthy of careful investigation by every corn grower regardless of his acreage. See your John Deere dealer and write today for literature that tells all about this tractor and its equipment. You will find it the most interesting fact-story on farm machinery you have ever read. Use convenient coupon at right.

JOHN DEERE

THE TRADE MARK OF QUALITY. MADE FAMOUS BY GOOD IMPLEMENTS

Pulls a two-bottom plow with a straight center hitch for plow and tractor—easy to guide—no side draft.

Plants three rows at a time, 30 to 40 acres a day. No planter lever—power lift raises and lowers runners.

Cultivates three rows at a time, 25 to 40 acres a day—no cultivator lever—power lift raises and lowers runners.

With power driven mower big acreage can be cut per day—25 to 35 acres. Easy to attach and detach.

Grinds feed, fills silos, operates the threshing—does all field and belt work within its range of power.

—USE THIS COUPON—

Orchard Windfalls

By S. W. FLETCHER

THE program of the annual meeting, to be held at Harrisburg, January 21-23, is now being distributed to the nearly 1,000 members. Out-of-state speakers include M. C. Burritt, of Hilton, New York, who will report on problems of the western New York fruit district, which is the chief eastern competitor of Pennsylvania, giving special attention to fruit cooperatives and to the compulsory grading law. The latter subject will be discussed, also, by W. S. Campfield, of Staunton, Virginia, who is convinced that it is working out well in his state. All this is preliminary to a discussion of what we should do along this line in Pennsylvania.

F. H. Beach, of Columbus, Ohio, will judge the fruit show and will tell of his experience in the thinning of fruit and with the newer varieties. R. A. Van Meter, of Amherst, Massachusetts, will speak on the "McIntosh menace," as some alarmists call it—the increasing dominance of this variety in eastern markets—and what it means to Pennsylvania. It is expected that a member of the Federal Farm Board will speak at the banquet on Wednesday evening.

About twenty-five Pennsylvania growers will participate in "Growers' Experience—Five Minute Talks." H. G. Baugher, a nurseryman, and F. N. Fagan, a college professor, will argue the respective merits of one and two-year-old apple trees for planting; and there will be many other good things.

The Federal Farm Board
Pity the harassed members of the Federal Farm Board! They are driven from cover to cover by earnest seekers after a juicy slice of the \$500,000,000 melon. Many of the requests for help are sincere and meritorious, but the percentage of wheat to chaff must be surprisingly small. Then it has to contend with all sorts of subtle self-promotion schemes.

For example: The officers of the State Horticultural Association recently received long distance telephone calls and telegrams urgently requesting their attendance at a meeting in Washington, to perfect plans for nation-wide advertising of fruit. It was represented that this meeting was being arranged with the approval and in cooperation with the Federal Farm Board. Coming from such an august body, the invitation could not be declined. Representatives of the Association attended the meeting, only to find that it was drummed up by a ubiquitous advertising agency. The Farm Board had no part in it: no members of the Board were present, but one of their employees showed up to learn what it was all about.

Loud and raucous is the American advertising ballyhoo and numerous are the itching palms stretched pleadingly toward the federal purse. May the Farm Board be blessed with the wisdom of Solomon; this, and more, will be needed if it is not to flitter away its substance.

Apple Varieties
During Horticulture Week at State College, R. S. Sudds gave a summary of the variety preferences reported by several hundred fruit growers in different parts of the state. This is reliable counsel to prospective planters; these are the varieties that the growers have found most profitable. He has divided the state into five horticultural districts, based chiefly on geography and climate.

Southeastern District: (South of a line from Harrisburg to Stroudsburg, and east of the Susquehanna River.)—Stayman, Rome, Grimes, Smokehouse, Delicious, Jonathan, Summer Rambo, Southern Belle, Franklin Adams, York, Cumberland.)—York, Stayman, Grimes, Jonathan, Summer Rambo, Delicious, Smokehouse, Rome, Ben Davis.

Central District: (The mountainous section of the central and southern counties.)—Baldwin, McIntosh, Stayman Jonathan,

Spy, Grimes, Rome, Summer Rambo. **Southwestern District:** (West of Somerset and Indiana counties and south of Mercer.)—Baldwin, McIntosh, Spy, Rome, Wagener, Jonathan, Wealthy. In the southern part of this district, Stayman, Delicious and Grimes are added.

Northern District: (All the northern counties, and including Cambria and Somerset counties.)—Spy, McIntosh, Baldwin, Wagener, Stark, Wealthy.

Among the varieties that are definitely black listed by commercial growers for one reason or another are: Mann, Fall Pippin, Gillflower, Ewalt, Winesap, King David, Yellow Bellflower, Pewaukee, Salome, Smith Cider, Wolf River, Alexander, Roxbury Russett, Follawater, Hubbards-ton, Spitzenburg, King.

The reports indicate that there is very little new planting of apples in immediate prospect in Pennsylvania.

By the way, did you note Ben Davis on the list for the Southern District? It is at the tail end to be sure, as though Mr. Sudds, being a college professor, was ashamed to include it, but was forced to do so at the last moment. And why? Because many of the growers in this district report that Ben is making them more money than any other sort. And some are even planting trees of this contemptible variety. There ought to be a law against it!

Trellis or Arbor

WHEREVER grapes are grown they must have either a trellis or an arbor to grow on to keep them off the ground and to keep the fruit clean and easily accessible for spraying and picking. If the garden is small and the space for the vines is limited a trellis is usually used. If the garden is large enough the grape arbor is a pleasant addition to the permanent fruit garden.

In building a grape trellis the same kind of construction is needed as for the construction of a good grade of wire fence. The posts must stand about five feet out of the ground and for this reason the line posts of the trellis should be at least seven feet long. The end posts must be very well braced, as these will have to hold up most of the weight of the vines and fruit. Although some use No. 12 wire for a grape trellis I do not believe that it pays to use anything smaller than No. 10 and a No. 9 wire will give more satisfactory service. This wire should be well galvanized to make it last longer.

If two wires are to be used on the trellis space them 30 inches and 56 inches above the ground. If three wires are to be used space them 20, 40 and 56 inches above the ground. If the grapes are to be trained according to the modified Munson system of training the posts must be set about five feet out of the ground each with a cross arm at the top made out of a 2x4 two feet long. The poles should have a three-eighths-inch hole bored through them about six inches below where the wires will be that are stapled to the outside ends of the cross arms. A third wire is then run through the poles to complete this form of trellis.

In making an arbor for the grapes somewhat longer poles will be needed. These should be set in two rows about eight feet apart. They should be about two to three feet in the ground and from seven to eight feet above the ground when set. One-by-two-inch slat is nailed across the tops of each pair of poles along the line of the arbor to carry the wires that are strung fifteen inches apart across the top to form the roof. Other wires are stapled to the sides of the arbor 30, 48 and 66 inches from the ground. If the grounds near the garden are large enough the arbor is sometimes built in a hexagonal shape and is used for a summer house. W. E. Wiecking.

FARQUHAR NEW INTERCHANGEABLE GRAIN DRILLS

Here is the most completely satisfactory Drill combination. Sows accurately all kinds of grain with wide range in quantity; grass seed; fertilizer sown according to the latest approved method. Well balanced, light draft and easily operated.

But the Big Outstanding feature is the simple method of changing the Hoe drill to a Disc Drill—and this change can easily be made in 20 minutes. Ask for Big Bulletin No. 330.

MARKET PLACE

By W. R. WHITACRE

A REFRIGERATING truck has been developed by a California inventor that generates its own cold as it travels. It has been tested in the deserts of Southern California and at the end of the journey perishable products were found to be in perfect condition. The apparatus is compact and derives its energy from the drive shaft. A similar truck working on somewhat the same principle has also been developed but it has the additional advantage of being adaptable for work in cold districts as it prevents freezing.

I do not believe that either of these trucks is on the market as yet but it will be only a matter of time before they appear. The business of hauling fruits, vegetables and other perishable foods by truck has grown rapidly, and one of the disadvantages in the past has been that temperatures could not be controlled as well as in a refrigerator car.

There is a great field for inventive genius in improving the marketing of perishables. The refrigerator car while it has enabled California and other distant states to ship to eastern markets has room for improvement. Ice bunkers take up room that could be occupied by paying load, temperatures are not as uniform as might be and icing is expensive.

I have heard that experiments have been made with mechanical units but there are times when the cars are standing on track, or on a siding and there has been no practical way discovered to apply energy at this time. Solid carbon dioxide is another possibility, as it has small bulk with great cooling power. Heating devices for cars of potatoes which must pass through very cold temperatures can be improved. The charcoal stove in the bunker requires care, attention, gives off poisonous gases and is not entirely satisfactory.

Treating fruits and vegetables with gases or chemicals to preserve them and to prevent decay has been done to some extent. Apples and oranges from the West have been given a chemical bath to aid in the prevention of molds. A gas has been developed which hastens the coloring of oranges and other citrus fruits.

Color is one of the greatest factors influencing the sale of apples and it may be possible to develop some process that will give them the desired degree of color. The apples themselves throw off gases which when confined in a basket or barrel cause scald. The shredded oiled paper which is being used extensively today, is supposed to absorb these gases and to control this damage to a large extent. These are but a few of the possibilities that will be perfected and further developed in the future.

A Trench Disposal Plant

A NUMBER of years ago we solved the problem of disposing of tin cans, broken glass, crockery and such refuse as could not be destroyed by fire. Digging a rather shallow trench in a low part of the garden we began filling it with trash and pounding it down with an axe or mallet. Dirt was filled in and asparagus planted on top. Then by degrees we filled in the low place, which was well drained, and the asparagus yielded a fair crop the second year.

Seeing the good results we planted trees and shrubs in various places. Two cherry trees grew as high as the house in a few years, while apple and peach and plum succeeded just as well. A big hole was dug for each tree and filled almost to the top with refuse, then tamped down, earth filled in and the tree set.

I offer you BERRY PLANTS at WHOLESALE

Don't waste time on ordinary plants. My Hardy, Northern Grown plants are bred and grown scientifically and then carefully selected, one by one for shipment. They are not taken from old fruiting beds, but are grown for plants alone. Set some of my plants this year, in both the older, well known varieties and the Newer Better ones, and assure yourself a giant crop of choice fruit that will bring premium prices. In addition to this extra quality I offer you real wholesale prices on a few plants or many.

Send for My FREE CATALOG

It is free for the asking, and I want you to have a copy. All of the new as well as the old favorite varieties of Strawberry, Raspberry, Blackberry, and Grape plants are fully described, illustrated and the cultural directions given. Write for this catalog today, and see how I have made a better berry crop possible for you, and why I can sell you cheap, guaranteed, disease-free plants at wholesale prices. Don't buy until you get it.

PREMIER CONCORD
Premier, the earliest June strawberry, is frost proof, and will yield loads of fancy fruit very early in the season. It is the highest quality I offer you real wholesale prices on a few plants or many.

LATHAM
Latham, the new red raspberry, yields extra-big, continuous crops. Will not "winter kill." Fruit ripens evenly, and brings premium prices. Every plant double-inspected and disease-free, very high grade.

ALFRED
The new "Blackberry without a core," the greatest blackberry ever introduced in every way. My plants are the highest possible development of the strain. Very hardy, productive and vigorous.

THE YOUNG PEOPLE

A Cheerful Flower

The Jonquil

THERE is no flower more cheerful looking than a jonquil. A bouquet or flower pot of these blossoms seems to fill the room with sunshine.

We cannot always have real flowers but we can make glowing paper flowers that are so realistic that often one has to feel of them to find out that they have not been picked from the garden. Then there is a ready market for these flowers the year around.

For the jonquil you will require crepe paper in light amber for the petals, dark amber for the pistil and center tube, sand color for the sheath, and moss green for the leaves and stems.

Pistil and Tube

For the pistil cut across the grain a half-inch strip of dark amber allowing two inches for each pistil. Stretch the strip and fold the end of it in a tiny ball. Beginning with the ball, tightly roll the paper diagonally downward, around and around at the end.

For the center tube, cut across the grain a half-inch strip of dark amber allowing two and five-eighths inch for each tube. Fold a two and five-eighths-inch strip to six thicknesses. Round off the corners very slightly and flute each scallop once. To "dute," hold the edges of the scallop between the thumbs and forefingers, and push away with the left thumb, and pull forward with the right forefinger, stretching slightly with this motion. To form the tube, paste the straight edges together, one on top of the other, and overlapping only enough to hold securely.

The Petals and Sheath

For the petals cut across the grain a strip of light amber four inches wide and allowing three inches for each strip of three petals. Divide the three-inch edge into three equal parts, slashing inward two inches, and making these slashes one inch apart. Cut the corners around, and point the end. Two of these strips of three petals each are required for each jonquil.

The sheath is cut from the sand crepe paper, and the tiny leaf-shaped sheath is cut from sand crepe paper. It is cut with the grain running lengthwise and is one-half inch in the center taper to one-fourth inch at top and bottom. Wrinkle this slightly to give the appearance of a dried petal.

Leaves and Stem

For the leaves cut pieces of moss green crepe paper 10x1x1/4 inches, running with the grain of the paper. Fold this in the center with the grain and then shape the leaves by tapering one end, rounding the line gradually towards the point.

For the stem, cut across the grain a one-half-inch wide strip of moss green crepe paper, through the entire thickness of the fold. It requires about twenty inches for each stem.

To Assemble the Flower

To assemble the jonquil, place the pistil in the center of the tube, so the ball comes just below the edge.

Tulips, Jonquils and Roses are yours for the making.

and gather the tube closely at the bottom. Place a strip of three petals around the tube so the petals will project about one-fourth inch above the tube. Each petal will overlap the other slightly at the base. Full the remaining three petals around the outside so they will come between the first three petals. Twist a ten-inch piece of spool wire firmly once around the fullness, and cut away the surplus paper one-half inch below the wire.

Winding Stem

To wind the stem, fasten the end of the half-inch strip of moss green crepe paper to the base of the jonquil. Stretch the strip and wind closely around the base two or three times and down one inch. Brush the even end of the sheath with paste and enclose it in the stem wrapping. Place a twelve-inch strip of stem wire along side of the spool wire, continue the stem winding for three inches by holding the wires in the right hand, and twirling the stem around, guiding the paper, slanting it downward, and stretching it so that it will wrap the

Add a Line

TO the one sending in the best line to complete the poem, a prize of a book will be sent. Just write your line on a sheet of paper with your name and address and send it to Puzzle Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Mr. Hen

There was an old lady of Wooster
Who was often annoyed by a rooster
She cut off his head
Until he was dead—
(Add the prize line.)

New Year Resolutions

1. Do my home work every night.
2. Always do my lessons right.
3. Don't eat too much sweets or candy.
4. Always keep "spick and spanly."
5. Don't stay out late at nights.
6. Right your wrongs; keep your rights.

Little Folks' Corner

THE birds were all gathered by a brook down South. They were having a reunion. There were robins, red birds, orioles, sparrows and all kinds of birds. They had not met for several months. Mr. Robin is telling them of an adventure he had.

"When I was up North, I built my home close by a farm house. At this house there lived a little boy and a little girl. The boy's name was Frank and the girl's name was Elsie. One day when Frank and Elsie were playing they came near my home. How frightened my wife and I were. We flew around the nest crying for help. When Frank and Elsie heard us, I heard Elsie say, 'Those robins have a nest close by.' So they began to hunt for the nest, and very soon found it on a corner of the fence."

"Oh!" cried all the birds.
"Cheer up," said Mr. Robin. "They did not harm my nest at all. They only looked into the nest, where they saw four pretty blue eggs. Then they went away, and as they went I heard Frank say 'We shall come to see this nest again tomorrow.'"

"That was a wonderful adventure," said Mr. Catbird, "but if I were you I would not go back to that farm house again, to build my home."

The other birds then told of their adventures. The bluebird told of how he had been caught in a snare. The wren told about building his home in

a bird house, and about a little boy killing his mate. The oriole told about a man snaring him and putting him into a cage, and how a little girl came along and let him out. Each one had a story of his own to tell.

Then they sang songs and had a very merry reunion. Then Mr. Barn Swallow led them all to his home under the eaves of a barn where they saw his nest made of mud, in which there were four pretty eggs.

The Modern Farm Household is Happier Because of the McCORMICK-DEERING Engine

FROM dawn to dark, any time during January, February, March, April, May, June, July, August, September, October, November or December, there's likely to be work for a McCormick-Deering Engine. It is always there, always reliable, portable, versatile, uncomplicated. It works through meal-time, week days and Sundays, and all night long if need be. Give it 2 cents' worth of fuel and it will pump 3000 gallons, or separate 4000 pounds of milk, or do a week's family washing, or what have you?

McCormick-Deering Engines have high-tension magnetos for easy starting; sturdy, one-piece main frames for heavy duty service. They are built with removable cylinder heads, long connecting rod bearings, enclosed crankcases, speed govern-

Running water in the house! No more pumping. No more lugging heavy buckets. Think of the time and effort you save. Consider the convenience and added pleasure it will bring to your household.

nors, heavy, drop-forged, heat-treated steel crankshafts, and large, wide main bearings. All parts easy to obtain and easy to replace.

The four sizes of McCormick-Deering Engines—1½, 3, 6, and 10 h. p.—are available at the McCormick-Deering dealers' stores at fifteen thousand points in the United States.

The Hand That Rocked the Cradle

Chapter II

By W. D. ZINN

ABRAHAM LINCOLN once said: "All that I am or hope to be, I owe to my angel mother." There are two women to whom I am greatly indebted for whatever success has attended my efforts in life. The first of these was my mother. The second was a young lady with whom I, at the age of 22, formed a partnership for life. This chapter is written in loving memory of the woman who rocked my cradle and guided me through the precarious days of my youth.

My mother's childhood days were spent in a very humble farm home in a county adjoining the one in which Woodbine is located. Her father, James Gawthrop, was the pastor of several country churches. Her mother, whose maiden name was Hulda Waldo, was the daughter of John Waldo, a physician for both physical and spiritual ills. These grandparents, as well as my father, were all missionary Baptist preachers. Grandfather Waldo was indeed a missionary, for he rode horse-back over four or five counties ministering to the sick and preaching the Gospel in every home where a few people were gathered together.

A story is told of Grandfather Gawthrop, that he preached fifteen years for one church and the only compensation he received was from one old brother who, out of the generosity and goodness of his heart, gave his pastor twenty-five cents. My grandfather said: "Here is sister . . . She needs it much worse than I do. I shall give it to her." He preached twelve years for another church where his pay was a pair of woolen socks donated by a faithful sister of the church.

In Line of Duty

My grandfather was a very good man. As sure as there is a heaven, he is enjoying its felicities today and receiving his reward for his self-sacrificing work. But with all due respect for his blessed memory, there is considerable doubt in my mind whether he did right in serving gratuitously a people who were well able to pay him a living salary. While he was thus serving his brethren without pay his faithful wife was at home doing not only the indoor work but much of the farm work as well. She plowed, harrowed, sowed the grain and reaped it.

One Friday my grandfather sowed some oats. It was necessary for him to leave early Saturday morning, before all of the seed was harrowed in, for his Sunday appointment. My grandmother, with only one horse remaining went to the field and caught a colt that had never had the harness on. Putting one of the children on the old horse to drive, they harrowed in the oats with this improvised team.

I relate this story to show how resolute my grandmother was. I do not believe that the Lord requires of any man that he should neglect the wife in order to serve other people. The Bible says we shall forsake father and mother and cleave to the wife. My grandmother, however, bore all these privations and hardships uncomplainingly and felt that she was doing no more than her duty.

Valued Education

The church to which we all belonged was located near "Woodbine." This was four miles from my grandfather's home. Many times, when my grandfather was away from home, my grandmother would ride those four miles on horse-back to the church for the evening service and go back home alone after the meeting. In my imagination I can still hear her sing "Rock of Ages Cleft for Me," as she rides away in the darkness after being us goodnight.

Lucinda A. Zinn, the mother of W. D. Zinn.

I have never known a more cheerful woman. She lived to the ripe age of ninety years. She had a very happy disposition, and spent the last few years of her life a cherished member of our household.

My mother had an insatiable thirst for an education. At a very early age she became an incessant reader. The tallow candle was about all the artificial light other than the wood fire that homes had in those days. Even the candle was expensive. My grandfather was not a man of much money, as I have already said, he gave his time to ministering to others.

Economy was practiced in this well as in most of the homes of the day. In order to save the candle, mother often provided herself with lot of kindling wood and spent many hours at night sitting by the hearth reading, making a light by throwing one splinter after another on the fire. I wonder how many of our young people today would pay that price for an education!

My mother was a student at what was called Rector College, located in Pruntytown, W. Va. In this school she obtained part of her education, but the larger portion was obtained around the fireside in the home. In spite of difficulties she not only acquired a good knowledge of the English language but became proficient in Latin and Greek as well. She studied the sciences being particularly well versed in astronomy.

I taught more than twenty terms school before and after her marriage to my father.

Cure for Quick Temper

One of the first schools I attended was taught by my mother. This reminds me of an incident that occurred in this connection. I was studying arithmetic and had been trying to solve a problem in long division. Many unsuccessful attempts at the solution of the problem had caused me to lose my temper. In a rage I flung the arithmetic to the outside corner of the school room. Sooner had I done this than my mother, the teacher, marched promptly to my desk, commanded me to arise from my seat and gave me a well-deserved thrashing. I was not very severely shocked or surprised, for I had

The Weed Hog Amazed 4000 Farmers

A short while back 4,000 farmers saw a demonstration of a machine which no rain had fallen for weeks.

The cause of their amazement was the WEED HOG—a new type of harrow.

The WEED HOG was taken into a field of stubble on which no rain had fallen for weeks.

But the WEED HOG with its long SPIRAL teeth of tempered spring steel, dug in FLOW DEPTH, plowed up the ground, ripped out the stubble, mixed it with the soil and left the land ready to seed.

And not a single WEED HOG tooth stretched, bent or broke.

The WEED HOG was then taken into corn stubble 12 inches high where it repeated the performance.

The farmers who witnessed this job expected to see the WEED HOG clog, but their admiration knew no bounds as it ripped up the ground and stubble without clogging.

Next the WEED HOG was taken to a piece of fresh plowed ground to test as a seed bed breaker.

Again its SPIRAL TEETH dug in FLOW DEPTH, broke up lumps and clods, pulverized the soil, worked the humus down deep and left a fine, deep, well-mixed potato seed bed. Incidentally, it dug up a hush of spuds that the digger missed.

A REMARKABLE IMPLEMENT

The WEED HOG is fast making other types of harrows, especially the spring tooth, out-of-date.

For it does everything a spring-tooth harrow does and lets it do it faster.

The WEED HOG'S SPIRAL TEETH may be set to cut from 1 to 12 inches deep. They may also be spaced on the tooth bar as desired.

The WEED HOG is about the only implement that can be used in stony, rocky soil. Its teeth get down under and alongside stones and rocks, thoroughly work the soil WITHOUT BREAKING, BENDING OR STRETCHING. They are GUARANTEED FOR LIFE against this.

BEST FOR ORCHARDS

The WEED HOG has no equal as an orchard tool. It breaks up sod, keeps weeds down and mulches the soil.

FAST WORKER

The WEED HOG is a fast worker—especially in trash and barnyard manure for it works deep with practically no clogging because of its extremely rugged, FLEXIBLE frame and the ABSENCE of the usual trash-dragging front bar.

similar experiences at home.

Here let me say to the parent who is afraid to punish his child for fear it may not love and respect him later in life, that in my judgment this is a mistake. In our home my mother did most of the chastising and, while I have great respect for both of my parents, if there is any difference it is in her favor. It was she who subdued my stubborn will and developed in me a more wholesome view of life. But this chastising was not always done with the rod. As I remember it now the punishment that pierced my heart most severely and was the most lasting came about in this way.

No Love Like a Mother's

After I had disobeyed my mother and she had punished me with the rod, she often took me into her private room and kneeling down, with tears streaming down her cheeks, she implored her Heavenly Father to have mercy on her erring boy and to help her bring him up in such a way that he might be a blessing to the world. Ah, my dear readers, in imagination I can hear those pleadings and see those tears as plainly as I heard and saw them sixty years ago. True, it is that there is no love like that of a mother.

My mother lived nearly forty years after the death of my father. For many years we lived with her, that is, she was the mistress of the home. When, on account of the infirmities of age, she was forced to give up the cares of the home, she lived with us and my wife became the mistress of the home. As will be disclosed in later chapters of this book, I have been a very busy man. That is, I did not feel that I could afford to spend as much time with mother as I would have liked. Often when I went into her room she would look up and with a pleasant smile say, "Can't you sit down and talk with your mother awhile?" Those are also words that ring continually in my ears and I can say, without any reservation whatever, that the recollection that I failed often to comply with her request gives me more anguish of heart than any other thing I ever failed to do.

A Business Woman

Aside from being well posted on a great variety of subjects, my mother was a splendid business woman. The late Samuel Woods, at one time judge of the Supreme Court of the State of West Virginia, paid her this compliment: "I consider your mother one of the best business women and better posted on the topics of the day than any woman I ever knew." I felt that this was no little compliment to be paid my mother by one having the judgment and wide acquaintance of Judge Woods.

When I think of the character of the one who gave me birth and who did everything in her power to incline the twig the way it should grow, and then think of how little I have done for the world, I not only am ashamed of my accomplishments but I feel that I have never been duly grateful for the mother of whom God made it my privilege to be a son.

For Poultry Protection

POULTRYMEN in many sections of Pennsylvania are pestered with chicken thieves. How to prevent this nuisance is a common topic of discussion among them.

An active shotgun well loaded still proves to be an effective check. Appeals to the State Police force have in a number of cases brought arrests and a check of the nuisance. Many poultrymen are turning toward the tattooing of their initials on the inside wings of their poultry. While this will not necessarily stop the stealing it is a means of recognizing birds after they are stolen.

There is no doubt that the State Police force today offers one of the best means of breaking up these gangs of chicken thieves. But to make its work most effective, it is important that all cases of theft be reported to it promptly.

M. H.

South Texas

HERE is an empire in the making. Sunny skies, a mild climate, rich soil and abundance of water for irrigation have attracted farmers from almost every state in the Union. South Texas is developing at an almost unbelievable rate, yet the surface has only been scratched. Here are unusual opportunities for energetic, ambitious and big visioned men who want to work their lands the year around, who want to better their incomes and live in a pleasant, hospitable climate.

Chief of the more rapidly developing sections of South Texas are "the Winter Garden," south and west of San Antonio, and the Lower Rio Grande Valley at "the Tip o' Texas". In both of these production of citrus fruits, winter grown vegetables, nearly all kinds of staple crops, dairying, poultry and live stock raising offer a wide range of profitable farm activities.

The advantages of these sections are set forth in new illustrated booklets which are yours for the asking, issued as a part of the Missouri Pacific Lines' efforts to further the development of South Texas. Address . . .

No Land for Sale But Free Aid for All Our Farmers

The Missouri Pacific Lines have no farm lands for sale. We are, however, vitally interested in the development and prosperity of sections we serve. To that end the assistance of the Agricultural Development Department is available to every farmer living on or near the Missouri Pacific Lines. L. W. BALDWIN, President

Farm and Dairy

By L. W. LIGHTY

EROSION or washing away of the soil is a problem on the great majority of farms. Always the finest and best soil goes, the soil with the most and best plant food. At the same time the gutters, gullies and ditches that zigzag down the incline render the use of many implements impractical.

Even on a gentle slope some soils will erode rapidly. I watched a two-hundred-acre farm without any real steep slope wash away gradually so that from a very productive farm it came down to an almost nonproductive farm. It was sold lately at \$13 an acre, which was comparatively a very good price for it and it would have brought much less had it not been adjacent to the solid through road. It required forty years of neglect to accomplish this.

I just read a statement made by one of the guessers in the Department of Agriculture. His figures are appalling, but from personal observation I think his guess is quite within bounds and possibly too low. He estimates that 1,500 million tons of soil carrying 126 billion pounds of plant food is annually lost by erosion. I am not sure if I know what a billion pounds really is, but after observing for half a century the hundreds of farms that were ruined or nearly so by erosion I am inclined to credit any figures a fellow sets down when the whole country is concerned.

A Perpetual Fight

But I am concerned only with my farm, as you are with yours, and mine has been a pretty big concern from the very start. Fully a third of it was denuded completely when I got it. That is, all the top soil was gone and in places the gullies and gutters were from two to six feet deep. I conquered in so far as to enable us to use any kind of implements over the entire area. But to keep the newly made soil from washing away has been a problem and in fact a fight to this day. During the heavy freshets the water gathers in the old depressions and it will start gullies.

Often when the frost is coming out of the ground we have heavy rains. The earth is heaved and is very loose. In a few hours a number of ditches will be started that have to be attended to at once or the damage will be serious. Promptly I would place obstructions in the ditch like evergreen bushes, corn fodder or swale grass, but to hold it in place is a troublesome matter. I would drive stakes or weigh it down with stones, but these are a nuisance when we came with the implements later.

I just ran across an idea in the Kansas report of their State Board of Agriculture that I shall promptly make use of. The device looks just like the original Breed's weeder of long ago with the handles and shafts eliminated. A two-by-four stick is used. Half-inch iron rods are inserted in this two to three inches apart and two to three feet long. After the soil catcher and holder has been put in the ditch this device is inserted and stuck well down into the soil across the ditch. This is movable and when we want to use implements can easily be moved from place to place. If the stick is cut and joined in the middle with a hinge it can be handled and used more conveniently.

I am sure this device will be a great help, because if we can keep the swale grass or other earth catcher in place until it is weighted with earth all is well and the ditch closes itself. After applying ten to fifteen dollars worth of lime and fertilizer to the acre we cannot afford to let it go down the incline by erosion if we can prevent it. I have found by eternal vigilance we can do this.

To Limit Production

It is unfortunate that widely circulated periodicals should print misleading material relative to farmers' farming, but I find plenty of it in my reading. I just read an article most splendidly written on limiting production, but the writer displays the most woeful ignorance of farm conditions, and yet he proposed to settle the question of limiting production for all time.

He cited for his example a common everyday manufactured commodity and indicated how easy it was when a surplus accumulates simply to slow production by ceasing to operate a certain number of machines. So in the same way all the farmer need do is to put out of commission so many productive acres and prevent the production and the price is stabilized. Simplicity simplified that office desk.

This expert logician knows that loom will weave practically the same number of square yards one year or the other, but he does not know that an acre of soil may produce ten times as much of a crop one season as another. Here is where his pretty theory goes to smash.

My records show I had an area of corn and it yielded 1,480 bushels. A year later the same area was in corn and it yielded 510 bushels of a poor quality corn. This soil in the meantime had been improved in fertility and as a mere machine should have yielded ten per cent more. But weather conditions and pests unforeseen and uncontrollable reduced my crop to nearly two-thirds, while the acres remained the same.

The practical farmer of course knows all this, but the writer of magazine articles doesn't know he doesn't know. Thanks be the feeding of the world is not in the hands of the logician.

Changeable

In the old almanac where the weather was foretold for a year or most the half we were told was changeable, and so it turned out most of the time. That is the way with the weather and we are used to it. But the constant changeableness of the laws, regulations and rulings that govern states and communities often are annoying, unpleasant and may be destructive.

A number of years ago legal provision was made to encourage the growing of trees along the highway. Every land owner who would plant and start growing a certain number of trees was paid a small sum for the helping to beautify the landscape and bring the benefit that growing trees bring to an almost treeless country. Not many trees were thus planted that I know, but a few roads that travel occasionally show the advantage and wisdom of that plan.

But at this time the rulings are to destroy all the trees on both sides of the road regardless. I watched the destruction on a little stretch of road this summer. Among the many trees cut down was a line of the most beautiful weeping willows. Since the road has been finished I am convinced the trees would never have interfered with traffic and why they were destroyed is an enigma, because they were a thing of beauty.

The old saying is that it takes God a hundred years to grow a large oak but a fool can destroy it in an hour. We need not go far for verification.

A Feed Mixture

Please send me a formula for mixing feed for dairy cows. My roughage is mixed clover and timothy hay and corn fodder. I feed about the same amount of each.

I have my own grinding outfit. I use plenty of ear corn and some wheat. I wish to mix one bushel of ground

It Pays To Buy Good Machinery

A GOOD ensilage cutter pays for itself in one or two seasons. After that, it puts extra profits in its owner's pocket for 10, 15 and even 20 years. Papec Ensilage Cutters must be good because there are more of them in use than any other make.

Here are some Papec features that will appeal to the farmer who knows machinery:

1. Extra large, flaring table for feeding direct from the wagon.
2. Can elevate 80 feet at 400 r. p. m. without plugging.
3. Better than one ton per hour capacity for each horse power applied.
4. Adjustable lower casing to offset fan wear.
5. Six fans with replaceable fan plates.
6. Knives easy to adjust and sharpen.
7. Rockwood fibre driving pulley to prevent belt slippage.
8. Few gears and no springs.
9. One-piece frame to insure permanent bearing alignment.

It's some job to lead in Illinois

When cows do as well on a dairy feed as H. P. Zurbriggen's did on Gold Medal Dairy Ration, a lot of talk about quality becomes unnecessary.

Mr. Zurbriggen's herd is one of the highest producing herds in Illinois. Not long ago he led the entire State for three consecutive months.

Mr. Zurbriggen says:

"This high production I attribute to Gold Medal Dairy Ration as a big factor."

Gold Medal Vitamin Dairy Ration contains every element necessary for big milk production, and for maintaining herd health. It takes the guess work out of feeding because it was proved in countless tests under actual farm conditions before being offered to you.

Gold Medal Vitamin Dairy Ration is rich in vitamins, high in digestibility and made from clean, wholesome ingredients. It contains no filler or off-grade material.

Every bag is guaranteed to satisfy you, or your money back. Give it a trial—and you'll have healthier cows and bigger milk checks.

wheat with five bushels of corn and cob meal. What do I need in addition to these two grains to make a balanced grain ration? C. B. Mason.

I WOULD suggest that you make the following mixture after you have ground together one bushel of wheat with five bushels of ear corn, 100 pounds of corn and wheat chop, 100 pounds of ground oats or wheat bran, 100 pounds cottonseed meal, 100 pounds of linseed oilmeal, or peanut meal or soy-bean meal. Feed this grain mixture to Holsteins and Ayrshires at the rate of one pound of grain for approximately four pounds of milk. Feed Jerseys and Guernseys one pound of grain for approximately three and one-half pounds of milk, in addition to all the roughage they will eat up clean two or three times a day.

Trouble with Butter

In the winter I have been having trouble in making butter. I think the cream is sour enough. It just swells and foams till the churn is full and keeps that way.

Reader.
DIFFICULT churning is frequently encountered at this time of the year when the cows have been fresh for a considerable period of time and have been receiving no green or succulent feed.

I would suggest that you heat the milk nearly to the boiling point, separate and cool the cream and handle it as usual or else that you heat the cream to 110 degrees F., hold it at this temperature for a half hour, then cool the cream to churning temperature and hold it at that temperature for one hour or more prior to churning.

At this season of the year it may be necessary to raise the churning temperature to between 65 and 70 degrees F. under exceptional conditions.

A. A. B.

C. T. A. Reports

Cumberland County
THE Second Division finished its second year October 1, 1929, with 23 members. Their records show that there were 344 cows in the Association during all or part of the year. The results for the two years' work in the Association are as follows:

Year	Av. No. Cows	Lbs. Milk	% Fat	Lbs. Fat
1927-1928	221.75	8334	3.4	285.7
1928-1929	248.91	9328	3.5	332.0

Thirty cows produced over 400 pounds of butterfat. The complete list of these is too long to publish here.

J. P. Shughart, W. I. Galt, Tester. County Agent.

Oxford
THE Oxford Cow-Testing Association finished its second year, January 1, 1930, with 24 whole-year members. In addition four members were in the Association for part of the year. The total number of cows for all or part of the year was 543.

Thirteen herds with an average of five or more cows exceeded an average of 300 pounds of butterfat. A complete list of these herds follows:

Owner	Breed	Lbs. Milk	Lbs. Fat
Norman Thompson	G.J.	9123	438.0
Scott Bunting	R.J.	7258	383.5

Jos. S. Oberle, Charles M. Pyle, County Agent. Tester.

THE GENTLE BULL

Once a farmer had a bull. 'Twas hard to find his "double." Why, sir, that farmer led that bull Without a bit of trouble.

However, sir, there came a time When bull changed his way. The farmer sleeps beneath the sod. The bull still lives today.

—Bill Bunkum.

"As thou sowest, so shalt thou reap"

FRUITFUL indeed is the money spent by the farmer for high quality seed. For here is not only an investment that is returned many-fold, but also a crop insurance of the highest order. In an item so essential to success, it is indeed shortsighted to gamble on the long chance of saving a few dollars by using seed of uncertain origin.

High quality seed is chosen and certified by men who are scientifically and practically trained in just this work. When certified seed is used good stands and high yields are insured, other factors being equal.

Sow high quality seed and reap, not the "tares," but the most profitable, marketable crops your acreage can produce.

Agriculture and transportation are linked closely as the nation's two basic, essential industries. Experience has shown that, in the one as in the other, there is no greater asset than far-sightedness.

FREE Cow Book

Written in the language of the layman by a veterinary authority.

Here is an unusual new book for owners of dairy cows. Authoritative and complete—fitted to the everyday reference needs of the cow owner. Tells how to quickly recognize cow ailments by their symptoms—how to treat them and reduce your loss from disease. Illustrated—and full of general dairy hints and information. Send today for your copy.

Pep up the laggards and DOUBLE your profits .

IF YOU are tired of carrying your dairy through the winter with little or nothing to show for your hard efforts—try this new plan. NEW to you, perhaps, but tested and proven by thousands of money-making dairymen from coast to coast.

You'd not expect smooth-running, efficient winter service from a motor car adjusted, lubricated and fueled for summer use. Neither can you expect your cows to produce profitably under the terrific strain of winter feeding conditions—without special aid and support for the digestive and milk-making functions. Winter dairying disappoints when expensive feed goes to waste—fails to be converted into milk. It only takes a few laggards in the herd to eat up the profits of the good producers.

Use KOW-KARE for winter conditioning

Conditioning of the dairy herd during the period of barn feeding is the new money-making plan now coming into general use. Instead of a health-destroying drive to get a

disappointing yield from overworked cows, KOW-KARE conditions and regulates the digestion and assimilation—makes it easy to convert dry, hard-to-digest foods into a normal, profitable yield. This famous formula of Iron, the great builder and blood purifier, and medicinal herbs and roots costs only a few cents per cow per month, helps the cow to conserve her feed and ward off disease.

Try the KOW-KARE conditioning plan yourself on the laggards NOW. Remember that in an average dairy an increase of only 10% in the milk yield will *double the net profit* of the herd. The extra quarts are decidedly worth going after.

Freshening Cows Need KOW-KARE

The ordeal of calving is a serious drain on the productive vitality of any cow. Many serious ailments have their origin at this

time of lowered resistance. Every cow about to freshen should have the aid of KOW-KARE, fed in the ration for two or three weeks before and after. It is a small price to pay for cow health and peace of mind.

Mix Your Own Complete Mineral

For cows in need of minerals, an inexpensive mixture of recognized conditioners of value is made by mixing 30 lbs. salt, 30 lbs. fine-ground limestone, 30 lbs. feeding-pose bone meal and four cans (large) KOW-KARE. For well under \$6 per hundred you will have an unbeatable mineral. Use 80 lbs. of this mixture to a ton of grain.

KOW-KARE feeding directions are on each can. Sold by drug, feed, hardware and general stores—\$1.25 and 65c. If your dealer is not supplied we will mail, postpaid.

DAIRY ASSOCIATION CO., Inc.
Dept. 24, Lyndonville, Vermont

Use BAG BALM for Cows' Udders

For chaps, cuts, cracked or injured teats—for treating caked Bag, Bunches, Inflammation of the udder and similar troubles. Bag Balm insures quick healing, comfort, easy milking. Pleasant to use—cannot taint the milk. Big 10-ounce package, 60c—at stores. Mailed direct, postpaid, if your dealer is not supplied. Be sure to keep a can on hand.

"It sure does get them—all four at once and just one (1) late spraying is necessary"

the most economical delayed dormant spray on the market today"

Presidents and past presidents of several State Horticultural Associations—leaders among growers—are using Sunoco Spray. There are good reasons.

SUNOCO is economical because—(1) It costs less to buy—contains no water. (2) It covers more tree surface—(3) It will not freeze—(4) It saves time and time is money. Always ready to use.

Now an additional saving in cost is announced. Due to increased sales, the price has been reduced and your dealer will quote F.O.B. your nearest railroad station.

If you are not using SUNOCO, you owe it to your business to find out about it. Talk with friends who are using it and talk with your nearest SUNOCO dealer.

See your nearest dealer or write today for information—use coupon.

Farm Facts and Fancies

By ALVA AGEE

THE fact is that farming in this country is on the up-grade in respect to income. Nobody knows how much climbing it will do, and "climb" may seem a too ambitious word to use anyway, but it is up a bit, and quite a bit. The reflection is seen in a better feeling about land prices. They have been hit from three directions at once, and the wonder is that their bad situation was not worse.

In the first place, income from land did not encourage people to buy. That was serious enough. On top of that have been the forced sales and the effort of banks and other institutions to get rid of farms and loosen up their assets. That was a big influence in many states, and continues to be. The third sort of incessant pounding on prices has been the constant advertising of doleful conditions. It was believed to be in the interest of agriculture for which national consideration and aid were needed.

This third influence is now far less exerted, the second one has eased up, and farm income is better. The net result is that farm prices are to be given a fair chance, and that means that the market for farms is to be less depressed, and is less depressed now. More hopefulness and cheaper money are favoring land prices.

Others' Troubles

Much distress is relative. It is hard to be poor when one's associates are rich. It has been said right along that everybody has been prospering in recent years except the farmers, and we have overlooked the plight of hundreds of thousands whose income stayed fixed while the cost of living went way up.

Nearly every reader knows some folks in this class. Elderly people who depend on income from mortgages, annuities, bonds and like investments, all sorts of folks who had fixed incomes from savings made by themselves or by relatives for their support, a great company have found that their incomes were cut about half in two.

Some of them had made liberal provision, and the cut leaves them outside the class we have to pity, and others—and a host of them—are necessarily living on a poorer scale than hard work and saving earlier in life had led them to expect. They have been caught in the jam the war produced.

Cost of Services

We are told that the great industrial prosperity of this country in recent years was possible only through the high earning power and purchasing power of the workers. That is fairly obvious. Labor, using the term in its restricted sense, and all other workers of all sorts, has its price for service rendered reflected in the price we pay.

More serious for many of this great company of people dependent on fixed income is the price paid for services outside of the strictly industrial class. I am in contact with some of these folks, and the fear of the draft on their savings that illness may bring hangs over them. Anything they want or need costs them in a way they had not figured when capital was accumulated.

I believe it is a good thing that earning power is high, and the general level of living is much higher as a result, but there are people who see only hardship in it.

An Intelligent Man

The man driving the delivery wagon looked intelligent, and I was pretty sure he was so when he cheerfully made the guess, "One of these days none of us will work over five days a week." Of course he was not thinking

of farmers, but of employees in factories, stores and all that.

I should like to guess that if depression in industry becomes marked in the first half of this year while the basis is being made for a saner and surer prosperity, an impetus will be given to the movement for a five-day labor week. The argument will be that the available labor should have better distribution. Some trades now have the shortened week, and the trend that way is distinct.

The old socialistic plan of slicing off a part of the savings of the thrifty and dividing among those who have less seems crude compared with this new method of leveling. The arguments in favor of the five-day week for people rendering services of many kinds may seem plausible enough to some, but the cost necessarily falls back on those who have some accumulations of capital, either in land or some other form.

Doing the Driving

Forecasts in farm production are presumably an aid in planning for one's own farm. Others' "intentions" when known, should modify our own. Theoretically all this is fine, and in a way it has big practical value, but I have known many successful farmers that made no changes in acreage of crops year after year, and the rotation had been fixed so that the farmer could take care of his work on time and not let it do the driving.

It does not work very well to expand the acreage of potatoes or any other crop in a farm 25 or 50 per cent one year and to drop off the next. A forecast might indicate the wisdom of the change, but the farms I have in mind ran smoothly because a certain acreage was easily handled, and the work was well done, and I think the owners were better off than they would have been if they had made much change each season.

This is rather too old-fashioned thinking for a day when we have more data and should get value out of the information, and people who are specialists, and those with a habit of plunging, should make use of it, but the farm that easily carries a certain amount of livestock, and has a pretty well fixed acreage of crops, averages up well in the long run without paying much attention to what others are proposing to do. For one thing, the work is kept in hand and gets done well.

Forecasts that favor some cutting down have a surer value than those which lead to expansion and partly because the work does less crowding.

Diet Advisers

Citrus fruit growers made a big success in calling attention to the virtues of orange juice. The demand for the fruit increased. Now scores of fruits and vegetables have their health value boosted over the radio and in the newspaper health columns.

Nuts had their inning many years ago, milk rightly had and has a big place, and the corn bread and pork that gave strength and long life to the southern negro remain nearly alone with virtues unheralded. If we would return to dinners of corn bread, pork and beans, there would be less need of resting two full days out of seven—except, perchance, in the case of a few who might enter endless rest.

THE COVER THIS WEEK

WE may debate the quality and economy of home-made vs. bakery products almost indefinitely, but thousands of women know that the bread wagon makes less work than the bread board. However, the march of progress does not disturb the Taos, New Mexico, Indian woman shown on our cover this week as she takes the "staff of life" from her primitive oven.

"That's the sign of MORE QUALITY for the same money"

"LOOK here . . . do you see that—that Red Ball? Well, that's how you tell 'em. More value than ever before—without any boost in the price. And, believe me, that's saying a lot. Dad always wore 'em, and the best was none too good for him."

Yes, "that's how you tell 'em". The Red Ball trade-mark has been the farmer's guide for generations in his choice of rubber footwear. And today he's more loyal than ever. He knows the Ball-Band line keeps pace with his changing needs with new and improved footwear year after year.

The great Ball-Band factories prepare many different compounds of live, tough rubber, all devoted to one purpose—the manufacture of lasting footwear. Every item in the line is made up of several compounds, each selected to give greatest service for the job it must do—one for the heel, one for the sole, one for the toe, and so on. That's what gives this built-to-the-foot line the reputation for more days wear. Stout linings and fabrics are knit in Ball-Band's own mills at Mishawaka for—and only for—Ball-Band footwear.

Look for the Red Ball trade-mark on the rubber footwear you buy.

"THE BETTY"—a dainty style with lacy cuff. Easy to put on and take off because of its simple snap-fastener, adjustable to fit. This styled-to-the-shoe galosh is made in two-tone combinations in wool jersey, "Rayton" and cotton jersey.

A SMART NOTE in style footwear—the "easy-to-clean" Savoy all-rubber galosh. Combines lightest weight with complete protection. Each Savoy is "styled-to-the-shoe" and fits the foot and ankle as though moulded over them. Comes in a variety of pleasing colors and beautiful patterns.

There are 800 styles to choose from, including the famous Mishko-sole leather work shoe. There's a Ball-Band dealer near you (if not, write us). Ask him for Ball-Band by name.

MISHAWAKA RUBBER & WOOLEN MFG. CO.
484 Water Street, Mishawaka, Indiana

SNUG FITTING CLOTH ARCTICS. Deep warm, bitter cold, need hold no fear for you—if you wear these snug fitting Cloth Arctics. Also made in a 6-buckle height and in all-rubber styles in various heights.

pasture experts speaking:

"We cows get good grazing on our farm. Our Boss limes his pasture and gives each acre 600 pounds of his potato fertilizer when grass first starts in the spring. We work only a couple of hours to fill up on fine green feed. Our energy is saved to make milk."

"We had a hard time before our pasture was fertilized. All day and half the night we were searching for good grass. We had to be fed in the barn to keep us producing. Our Boss got tired of most of his milk check going for feeds. He decided to fertilize an acre of pasture for each cow."

"Pastures, like potatoes, are a cash crop and need balanced plant food. Potato fertilizer, containing plenty of potash, brings back clovers and good grasses and crowds out weeds. It keeps our pasture in tip-top shape. No wonder we are contented cows."

These three plots in a Maryland pasture show the value of the proper fertilizer treatment. The plot at left was fertilized with superphosphate alone. The center plot received superphosphate and limestone. The plot at right received limestone and a complete fertilizer containing plenty of potash. During an extremely dry season the right plot yielded 7,411 pounds more green weight than the center plot.

FARQUHAR

"Non-Wrap"
SPREADER

MAKES AN
EVEN DISTRIBUTION
of any kind or condition of Manure; therefore
increases Soil Fertility and assures largest crops—

The beaters cannot wrap and must deliver the manure to the distributor in an even stream. The 16-point Distributor completes the pulverization and spreads the manure evenly over every square inch of ground.

The "Non-Wrap" Spreader appeals to the farmer's good judgment. He sees its big advantage, the labor saving and ultimate profits. Strongly built, low down and easily operated. Write today for big folder giving full details of the oscillating beater arms and why they do not wrap.

By R. P. KESTER

PART of the joy that comes to one who writes is derived from the letters received from readers. During the past month I have received an unusually large number commenting on subjects mentioned here—garden tractors, the tariff, social customs, farm relief, flowers, children, mulch paper, log-rollings, the schools, prohibition, etc. Most of these I have answered, or will answer, by mail. Every one contains something which would make interesting reading if passed on. This, of course, is impossible, but I shall continue quoting from some which have a bit of advice or information of value to others. I wish to repeat my expressions of appreciation from the many friends who have written and hope they will continue to feel free to write any comment or criticism that comes to their minds.

We dug up some of our parsnips during the warm spell the first week in January. They grew well and showed great promise last fall. While they are big enough, they are not nice. They are prongy, scraggly things and are hard to prepare for cooking. What's the reason? Is it due to the fact that the summer was so dry? I have thought that they probably sent out several root prongs in order to get more moisture. Usually, we have grown fine, clean, straight parsnips. To forestall a possible explanation from somebody I will state that the soil is deep and has plenty of humus.

Friendly Talks

By
Edgar L.
Vincent

A reader in Bedford county, Pa., writes as follows:

"I would like to hear from readers of Pennsylvania Farmer who tried paper mulch last summer. I tried it on strawberries and garden vegetables. I used boards, two-by-fours and stones to hold it down. Where this material was on the paper, the paper rotted in about two months and weeds grew through the rotted paper. Has any one found a better method of holding it in place?"—C. E. S.

Another reader, this one from Centre county, who has evidently read Neshaminy Garden notes with considerable concentration, says, in part: "I have read your recommendations in regard to blanching cauliflower. I use a different method very successfully. When the cauliflower is ready to head 'kink' the ribs of the leaves and lay them over the tops of the heads. Kink them a little higher to allow for growth of head. I found that by tying the leaves they slip from under the string as the head grows. But by kinking the leaves the head can grow and expand all it wants to and the leaves will lie flat on the head."

"Two years ago a storm blew off a good bit of felt roofing from my barn. There was a good bit of it and I tried it for mulching paper on my tomatoes and had the best crop I ever saw. They were nice, clean and big. But I think the price of the paper is too high, and I do not like the expense. Have been thinking of using a cheaper grade of roofing paper, but I do not know how long it would last. Considering the labor saved, it would be cheap at the price, providing it would last more than one year."

"In regard to dwarf pears, would say I have had good results with Bartlett's; but Clapp's Favorite did no good. Have had splendid success with the plum Waneta. It is something like Bradshaw, but is more solid."

"Thanking you for all the advice I have received from your writings, and wishing you Godspeed for the coming year, I remain, yours sincerely"

V. G.

It is my opinion that the 'ideal' mulch paper would be one that would sell at such price as would not require saving to use another year. In fact, that is the intention of manufacturers now. But can it be used at a profit? That is the final question. I believe in the principle of mulching paper for some crops. The things it must do are to save enough by bigger and better crops, and by the reduction of hand labor, to overcome the cost of paper and its application.

Ninety per cent of the 1929 graduating class of the New York state college of agriculture are engaged in agricultural occupations.

Farm Pests in Ancient Times

By E. K. EVANS

It happened down in Maine some thirty years ago. In the sparsely settled sections many of the churches had resident ministers only in summer when students at a local theological school went out, to practice their eloquence Sundays, and week-days practice their calling. One such student, stating on his rounds of a Monday espied (so runs the story) a parishoner working in his garden.

"Oh, good morning," said the embryo parson. "And eh—what are you doing?"

"Weedin' my beans," said the somewhat terse reply.

"Well, don't you want me to help you?" queried the future servant of humanity, who had never raised beans except from his plate to his mouth.

"Tain't necessary," replied the gardener.

"Oh, but I'd like to help. That's what we're here for, to help one another." And without more ado he climbed over the fence, knelt down at some risk to his trousers, and—lo, after a few moments up came a hill of beans. Then after a few remarks on the joys of farming he moved along and—up came another hill of beans.

"There," he said as he proudly surveyed his harvest. "I've helped you a little anyway. Hope I'll see you next Sunday." And he climbed back and rambled on down the road.

"What did you let him do it for?" inquired a neighbor.

"Har," answered the victim with a resigned smile. "I wouldn't have stopped the little fool if he'd pulled up the whole farm."

Serious Annoyances

Now possibly any study of farm pests should begin with a chapter on the human pests who, if they do not pull up the beans, stand around to ask foolish questions, or give absurd or superfluous advice. Fortunately for them the average farmer is good natured, may even regard them as a diversion. Not so, however, when he confronts the four and six and many legged varieties, or sees where they have been at work. Then his forbearance ends. When it comes to Colorado beetles, and Hessian flies and army worms and corn borers and cotton weevils and all the rest of the "brood of Satan," that in 1904 were estimated to cost more than the United States government, and in 1919 to have destroyed a tenth of our farm crop—why silence will not suffice even though diluted with Bordeaux mixture.

A half dozen years ago out of the 73 "worst insect pests" in our own land 37 were imported. The full list of immigrants at that time included about a hundred Latin names. Many of these, of course, were old acquaintances of the European gardeners; but some, one suspects, were fairly new at the game, like our own Colorado beetle which after living a retired life in the Rocky Mountains broke forth into public notice about 1855. Unlike the Rocky Mountain locust which sometimes sails 200 miles a day with a good breeze, it took him about four years to reach Des Moines and some twenty to gain the Atlantic Coast.

What lured him forth on his long journey? A new and attractive food, the potato, of course—within easy reach, the temptation was too much for him. And so too with other citizens of the insect world. As long as farms were relatively scattered, commerce in the staple foods chiefly local, wild grains handy or as long as some improved garden crop did not entice them away from the rougher herbage

on which they had hitherto fed—why they might worry along, yet have a purely local range or do so little damage that they would hardly be considered pests. For such insects, as for man, modern agriculture and transportation have opened new and larger opportunities.

Bugs not in Evidence

This is probably the reason why the ancient farm-writers gave them so little space on their pages. True, they do refer to some of them, including several—the locust for instance—still doing a thriving business. True, also, the silence of Theophrastus, "the father of Botany" (about 300 B. C.) or of Pliny, author of that wonderful "Natural (and sometimes unnatural) History," does not absolutely prove the others were not on hand. No one knew about bacteria till the development of the microscope in the 17th century, but they were there just the same. Possibly, indeed, in the lost 160 notebooks of Pliny (till his death, in the famous eruption of Vesuvius, he was, like Mr. Pickwick, always taking notes) contained a full biography of a score of modest little caterpillars. But the chances are against it.

And if one urges, "Well, the ancient naturalists were not strong on entomology anyway; while the widespread belief that worms and insects sprang from decaying vegetation, etc., did not stimulate close observation," to this we may answer that they did study the bees closely, even though the drones bothered them, while Pliny has a "king bee" ruling the hive, and Vergil suspects they come from flowers. Altogether then though the ancient farmer had troubles enough, Heaven knows, 'tis probable that some of the bugs had not yet found out where he lived, or else were shyly keeping out of sight till some of his other pests moved on. Of course, as already stated, a number did take a chance and "made good"—from the bug's point of view that is. This was especially true in the vineyards and orchards. "Some diseases of trees" writes Pliny, quoting from Theophrastus:

"Some diseases are common to them all, worms for instance. This the birds are able to detect by the hollow sound procured by tapping at the bark. These

worms even now have begun to be looked upon as delicacies and the large ones found in the pear are held in higher esteem by the epicures and are even fed with meal in order to fatten them."

This way of keeping down the worms has never been systematically studied at our agricultural colleges. Pliny goes on:

"But it is the pear, the apple and the fig that are most subject to their attacks. Of those which infest the fig some breed in the tree itself. They all emit a small, shrill noise. There is a kind of fly that is very troublesome to some fruits, acorns and figs for instance. It would appear that they breed from the juices secreted beneath the bark which at this period are very sweet."

The ants knew better. As to the olive:

"Rain, too, is productive of the caterpillar, a noxious insect which eats away the leaves, and if the sun should happen to shine after this and burn them up, this pest only gives place to another just as bad."

Presumably he refers to the ichneumon which breeds on the caterpillar in accordance with the famous law:

"Big fleas have little fleas upon their backs to bite 'em and these again have other fleas and on ad infinitum."

Remedies Recommended

Coming to remedies, he describes one mixture of sulphur, bitumen, etc., for anointing the trees and vines, then:

"Some rub the pruning knife every time it is sharpened upon a beaver skin—and after pruning with the blood of a bear." Many people preserve apples from caterpillars as well as from rotting by touching the top of the tree with the gall of green lizards."

Probably this last method was scarcely as successful as another too little appreciated till recent years. Nowadays even the most crabbed, tone-deaf farmer listens sympathetically to the prayer of the Birds in the last act of Rostand's "Chanticleer":

"Oh, God of birds, or rather for the Hawk
Has surely not the same God as the Wren,
Oh, God of Little Birds!
Who breathed into our wings to makes us light,
And painted them with colors of his sky,
All thanks for this fair day, for meat and drink—
And thanks for these good little eyes of ours
That spy the unseen enemies of man,
And thanks for the good tools by Thee bestowed
To aid our work of little gardeners,
Trowels and pruning hooks of living horn."

"Tomorrow we will fight borer and blight.
Forgive Thy birds tonight their trespasses,
The stripping of a currant bush or two."

"If man the unjust pay us by casting
stones
For filling field, and wood and eaves with
song,
For battling with the weevil for his bread,
If he lime twigs for us, if he spread
snares,
Call to our memory Thy gentle Saint
Thy good St. Francis, that we may forgive
The cruelty of men because a man
Once called us brothers, 'My brothers the
birds!'"

When one remembers that 95 per cent of the house-wren's food is insects, 65 per cent of the downy woodpecker's, who can keep back an "Amen"? Thus today when the dainty house cat and the shotgun and air rifle have done their deadly work, the weevil is very much in evidence. In ancient times, however, it was the other way. They did not have shotguns. Nor were cats as common. So birds were probably more plentiful and weevils less so.

Unfortunately, it was just a case of nerves on the part of the farmer, of ignorance on the birds' share in farm economy, or were there really not enough weevils to go around? Anyway 'twas the birds which seem to have been regarded as the greater pest. Curious the methods employed at times to escape their visits. One

Southern Trip Shapes Up

THE special cars ordered for the Pennsylvania Farmer winter vacation trip to Florida and Cuba are rapidly filling up as reservations reach us daily.

We shall try to take care of late comers, but cannot promise to do so. However, we believe that all those who send in reservations now will not be disappointed.

For detailed information about this trip see Pennsylvania Farmer for January 11, also previous issues. A good crowd of fine people will be on the tour. If you would like to go along mail us request for reservations, using the coupon printed below.

Four Manager,
Pennsylvania Farmer,
7301 Penn Avenue,
Pittsburgh, Penna.

Enclosed find deposit of \$20 per person for reservation on the Florida and Cuba tour. Balance, or \$164.50 per person, will be paid before February 1, 1930. (Remittance should be made by check or money order—not cash.)

PROLIFIC

THE London Livestock Journal reports that a sow, the property of Mr. T. Fardy, Foulksmills, County Wexford, has given birth to 26 pigs, "all in strong healthy condition." Her two previous litters were 18 and 19 respectively, or a total of 63 pigs in three litters. Any American hog raiser any remarks to make?

A MODEST QUESTION

AN official announcement says that several bureaus of the Department of Agriculture, representatives of forty-one state colleges and fifteen representatives of the Federal Farm Board will participate in a series of conferences prior to the publication of the agricultural outlook for this year. Wouldn't it tone up this crowd a bit to include a few agricultural editors?

FROM LIFE

WE have known two men of modest means who were breeders of trotters in a small way. Each of them succeeded in producing a speedy colt and in developing it until a long price was offered. One man accepted the \$30,000 tendered him, bought a good farm with the money and erected thereon a monument to the old mare which had raised the colt. The other man refused the \$15,000 offered him, then his colt went wrong and was never worth much to anybody. It is usually wiser for a poor man to take a high price for an animal than to refuse it. Better take the cash and let the buyer take the risk, then try to breed another good one.

SOMEWHAT BETTER

THERE are a few things aside from the tariff which promise some improvement in the woolen textile industry, the market for our wools. Manufacturers are cooperating as never before to eradicate abuses or unsound trade practices which have proved so costly in the past. They are cooperating also in promoting the use of wool fabrics, not merely as in the past but in new ways and products. The manufacturers have learned, from a succession of unprofitable years, some things that will be helpful in the future. In all this progress the wool grower has a certain interest, for he can't find a good market with a depressed textile industry and closed or busting mills.

TWO GENTLE ONES

LAST week J. Frank Radabaugh, assistant farmer at the Methodist Children's Home near Mechanicsburg, Pa., was so badly gored by a bull that he died within an hour. Mr. Radabaugh was leading the bull to water

PENNSYLVANIA FARMER

when it attacked him. The account which comes to us says: "Attendants at the Home cannot explain the bull's action, as it never before caused trouble."

Charles Ludwig, a 65-year-old farmer of Clinton county, Mich., was leading a bull to water when the animal, which was considered gentle, turned on him, breaking several ribs, the breast bone and puncturing one lung. Mr. Ludwig is reported in serious condition.

The gentle bull, the unexpected attack, the death of the victim, all these are familiar to our readers for whose protection we have recorded about 200 cases. There is no way to explain any bull's sudden attack, but no explanation should be necessary after so much evidence that every bull is always an uncertainty, always a potential murderer.

E. P. SNYDER

ONE by one our old friends fall before the scythe of Time. Last week E. P. Snyder, for many years a valued contributor to these pages, died at the ripe age of eighty-nine. Mr. Snyder was a soldier of the Civil War, twice captured by the enemy and once severely wounded. As soon as he recovered from his wound and his experience in Andersonville prison he became a school teacher. Out of his meager salary he saved enough to make a small payment on a farm, and he was a farmer the rest of his active life. His success made him welcome as an institute lecturer and as a writer for the press and he was highly useful and helpful in both. Mr. and Mrs. Snyder reared six children and gave them all university education; but better than that they made every one of them an asset to the country, honorable and useful men and women. And again we ask: How can we despair of agriculture when it yields such men?

NO NEED FOR BOOMING

IN his weekly letter Mr. W. F. Jensen, Secretary of the Association of Creamery Butter Manufacturers, says: "The present situation is the natural outcome of the great stimulus that has been given to dairy production for quite a long time by business men's organizations, chambers of commerce, state and federal officials and others. The industry should now be given a rest until the public can absorb and consume the production." Among the "others" mentioned are banks, railroads and service clubs, all promoting the dairy industry in various ways.

For years we have protested that this program of expansion was unsound and predicted its inevitable end. But the depression was much longer in coming than we expected, due largely to the reduction in number of cows by the campaign to eradicate tuberculosis and to the improvement in the beef industry. Experience has proved that no booming of any line of agricultural production is necessary in this country. The natural expansion following profitable production will be sufficient in any case.

AN EARLY WARNING

THE Federal Farm Board makes a clear statement of its position in regard to cotton acreage, telling producers that it cannot protect them if they "deliberately overplant" and warning them that what it will do with this year's crop depends on what they do at planting time. Since planters know that the Board has authority to deal with surpluses, and expect that it will deal with them by buying and holding if necessary, will the Board's words of warning have the desired effect of reducing acreage? Will cotton planters be governed by the Board's present expression or by what they think will be its future acts? This year's cotton acreage should give us some idea of the ability of a powerful official agency to regulate crop areas by propaganda.

Thus far all such appeals and warnings have been disregarded, but none has been issued heretofore by such a body as the Federal Farm Board.

FOR ORDERLY MARKETEERS

THE Food Research Institute of Stanford University says: The statement is frequently made that wheat prices are usually depressed much more than they should be in the period of heavy farm marketing just after harvest. This view is widely accepted and has given rise to agricultural discontent, to criticism of wheat dealers and of the wheat marketing system and to much of the expectation of substantial gains from large-scale cooperative marketing, or from governmental price stabilization. A recent investigation by the Food Research Institute of Stanford University, California, suggests that this view is quite unfounded. During the 15 pre-war and seven post-war years covered by the investigation, the post-harvest depression of wheat prices in the United States was insufficient to yield gains from storage adequate to cover the storage costs of many if not of most wheat farmers. Farmers, with lower costs of storage than most dealers, could have profited by holding wheat for sale in the spring months only by wise selection of the years in which to hold. It is admitted that much wheat must sometimes be stored by dealers in terminal markets and they should not be called upon to store the wheat at a loss, the post-harvest depression during the years cannot be regarded as excessive.

That is a very conservative statement, about ninety-nine out of every hundred persons believe that wheat prices are greatly depressed while farmers are selling and greatly enhanced afterward. The records show that the case is as stated by the Institute and the present system of marketing is responsible for it. Yet we are told by those who have never studied nor understood the problem that this system, evolved for the purpose of avoiding waste, cost and risk, is a wasteful system and should be supplanted by some other that will insure "orderly marketing." We venture to predict that the present system will not be replaced by another very soon. Also that any new methods in marketing wheat will utilize the current system in Canada rather than abolish it as in the dreams of the orderly marketeers. A system which business, that great seeker and finder of economies, has evolved from many years' experience is not likely to be submerged by a theory based on assumption.

A PENNSYLVANIA PROBLEM

ONE of the problems to be discussed at the many state organizations which meet at Harrisburg next week is the future of the annual Farm Products Show. The problem is stated fully and fairly on the page of this issue, so we need not go into details here. We wish to suggest, however, that with proper patience and diligence it may be possible to have two great agricultural events in Pennsylvania instead of one. On the success of the mid-winter Farm Products Show it may be possible to build an autumn livestock and fat stock show that adequately represent the great animal industry of Pennsylvania and of other eastern territory. And this without sacrificing any of the commercial or popular good will that has been developed for the Farm Products Show. We speak of this as a possibility, but it may not be so remote as the proponents of an immediate shift to an autumn show suppose. Space is going to be inadequate for two great shows in one, though it is adequate for either of them. And we might better resolve to develop both separately with ample facilities for each than to attempt both at one time with insufficient facilities for either. At least a trial of the policy of development, without special state aid, is better than jumping to the conclusion that the mid-winter show should be abandoned for the autumn event. We hope that those who are earnestly striving to solve the problem will come to some such conclusion.

DO New Jersey farmers need the aid of the Federal Farm Board, do they cooperate with the Board, and in what way? In order to get some answer to these questions and in response to a request from the Federal Farm Board, a marketing conference was called at the New Jersey Agricultural College and Experiment Station to consider with other agencies in the state plans and policies for cooperating with the Farm Board.

All of the present work of the State Department of Agriculture and the college pertaining to the marketing of New Jersey's farm products was viewed during the morning session of the conference on January third. The afternoon was given over to a discussion of the marketing problems which confront the farmers in the state at the present time.

Congressman Fort, in speaking of the Agricultural Marketing Act as it applies to New Jersey, said that while the industry has organized during recent years so that there is a coordination of production, agriculture is not kept pace. Industrial products are standardized, widely advertised and sold through organized distribution. Farmers in the West and South have more nearly met these requirements than farmers in the East and have organized into cooperatives, standardized their products and advertised them.

"There is danger of New Jersey losing its market to the West and South," said Congressman Fort. That New Jersey products should be advertised and recognized on the markets as fresher products in order to compete with the influx of Western and Southern produce, was suggested.

Here arises a question: Are the products of New Jersey quality products? Fresh produce and nearly all New Jersey products are of high quality.

New Jersey farmers are often blinded by the illusion that they produce quality when they do not. With every high quality package sold there is another on that same market from the same farm or adjoining farm containing small and wormy apples, sweet corn nubbins, rusty beans, etc.

Nearly Market Complications

Markets nearby to New Jersey add complications to the problem of standardization and advertising of their products. This fall when Mr. — was selling cull apples on the Philadelphia market for

as much as he gets in normal years for first grade apples, it would have been difficult to convince him that these could profitably be kept off the market. The cities always have buyers for ungraded and cull farm products and there are always nearby farmers ready to cater to these markets.

Standardization of products from New Jersey farms has been questioned, but is there any other solution by which these farmers can meet the competition from the carefully graded and widely advertised products from the West?

Dr. Frank App, a member of the New Jersey Farm Relief Committee, mentioned some problems acute to New Jersey agriculture at the present time. Among these were the needs for readjustment of freight rates to allow just competition between production sections, and reforestation of marginal farm land. He criticized market reports as not speaking the language of the producer so that he could intelligently use them, and suggested that more information be made available to what competitors in other sections are doing.

These New Jersey marketing problems require careful study and analysis, but as Senator David Agans pointed out, if this research is carried on long without definite action forthcoming the present problems may be replaced by others.

It has been said that the favorite sport of the American people is appointing committees and passing resolutions. Too often we expect to lift our shoulders and immediately solve that particular problem by passing a resolution and placing it in the hands of a committee. No body, no committee or resolution can solve the marketing problem in New Jersey without the cooperation of each individual farmer in the state.

New Jersey Farm Comment

By G. W. HARRIS

NEW JERSEY MASTER FARMERS

The four Master Farmers of New Jersey for the year 1929 received their Master Farmer Medals at the annual dinner of the Federation of County Boards of Agriculture in Trenton on Wednesday evening of Farm Week. The part of the dinner program devoted to the presentation ceremony was conducted jointly by the American Agriculturist and the Pennsylvania Farmer, donors of the Awards and joint sponsors of the Master Farmer movement in New Jersey.

New Jersey's Master Farmers for 1929 are:
James C. Ewart, Middlesex county.
Charles Fitting, Atlantic county.
Franklin G. Rue, Monmouth county.
Alfred F. Sloan, Salem county.

After preliminary work was done last summer and fall, the final selection of the Master Farmers was made by an independent board of judges consisting of: Dr. J. G. Lipman, Dean of the New Jersey State College of Agriculture and Director of the Experiment Station; William B. Duryee, Secretary of the New Jersey State Department of Agriculture; Harry E. Taylor, Secretary of the New Jersey Federation of County Boards of Agriculture.

Further information about New Jersey's Master Farmers, including biographical sketches, will appear in next week's issue.

MARYLAND farmers and their wives, nearly 500 of them, met in Baltimore last week for the annual meetings of the Maryland Agricultural Society, the Maryland Farm Bureau Federation and affiliated associations. They made their headquarters at the Lord Baltimore Hotel where the fruit and vegetable growers, livestock men, poultrymen, dairymen, beekeepers, tobacco growers and farm women discussed their various individual problems.

At a joint meeting with the Farm Bureau C. B. Denman, a member of the Federal Farm Board, outlined the object and functions of the Board as applied to agriculture in Maryland and other states. Governor Albert C. Ritchie addressed the group on Thursday evening at their annual banquet, an event which was the climax of the four-day meetings.

J. S. and E. T. CULLEN of Cecil county, Maryland, were awarded the silver trophy and \$125 in gold for the best litter in the Maryland 150-day cup, which is awarded each year by the Maryland Agricultural Society and Maryland Farm Bureau Federation, was presented at the annual banquet of the Maryland Livestock Association held at the Claremont Hotel, Union Stock Yards, in Baltimore, on Wednesday evening.

There were 13 pure-bred Poland-China pigs in the winning litter which at the end of 150 days weighed 2,140 pounds. Mr. Cullen figures his profit

from this litter at \$101.39. He attributes the championship to ideal farrowing weather, good breeding, good pasture, and good feed and plenty of clean water.

Second prize winner in the contest was Ralph T. Wilson of Cecil county with a litter of 10 Poland-China pigs weighing 1,873 pounds at the end of the 150-day period. E. E. Remsburg of Frederick county placed third with his litter weighing 1,789 pounds.

THE practice of dumping dead poultry along the roadside was brought to the attention of the Hunterdon County Board of Agriculture last week. It was reported that a year ago one farmer lost most of his flock through an outbreak of cholera which was caused by an unknown party dumping a sack containing dead birds, evidently affected with cholera, on his property.

Edward Nief, representing the Hunterdon County Egg Laying Contest Association, reported that someone had just recently dumped some dead birds along the roadside near his farm.

Poultry dealers and others who use this method of getting rid of dead birds should not be subject to any leniency of the law.

A TOTAL of 186 records have been completed in the 10-month and yearly divisions of the advanced register of the Holstein-Friesian Association for New Jersey, reports W. R. Robbers, superintendent of advanced registry, New Jersey Agricultural Experiment Station.

In presenting figures for the entire county, Mr. Robbers reported an average of 15,712.5 pounds of milk, 515.5 pounds of butterfat, and 3.25 per cent fat.

A total of 67 New Jersey-owned animals made advanced registry records in the 10-month division averaging 13,774 pounds of milk, 459.67 pounds of butterfat, and 3.34 per cent fat.

In presenting figures for the entire county, Mr. Robbers reports that 31,392 advanced registry records have been completed in the 10-month and yearly divisions.

Of this number 23,639 were yearly records averaging 16,703.6 pounds of milk, 566.8 pounds of butterfat, and 3.39 per cent fat in 347 days. In the 10-month division 7,753 tests averaged 14,139.4 pounds of milk, 476.4 pounds of butterfat, and 3.37 per cent fat in 298 days.

"These figures," states Mr. Robbers, "are so far above those of the average cows of the country, and even beyond those of the dairy improvement association herds, that the intelligent dairymen will continue to recognize the wisdom of buying their foundation stock, particularly the bulls, from such advanced registry herds."

THE tree is equal to Carman or Belle in vigor, and the fruit is larger and of a more attractive color than either Cumberland or Carman. The fruit hangs to the tree well, even after it is ripe, and the quality is excellent. It is expected that this seedling will take the place of Carman in the New Jersey planting of early white-fleshed, commercial varieties.

FOUR youthful poultry enthusiasts will represent New Jersey in the National 4-H Club Poultry Judging Contest, scheduled for January 18 as a part of the Madison Square Garden Poultry Show, New York.

Members of the poultry judging team are Robert Lawther of Vineland, captain; James Pettit of Salem; William Bappert of Sicklerville; and Walter Kirjlin of Vineland, alternate.

TOO GOOD TO BE TRUE

Pasture Improvement Tests

By J. B. ABBOTT

DURING the past season a group of agronomists associated with the fertilizer industry have carried on a number of pasture top-dressing tests in the northeastern states. These tests were undertaken with the idea that probably a shortage of plant food is the limiting factor in the production of pasture land, that applications of fertilizer should be rather liberal in order to overcome the bad effects of a hundred years or more of neglect and that the first problem is to determine the plant food needs. Questions of pasture management, economic adaptation of the several treatments under different conditions, etc., are not covered in any detail and of course require further study.

The results of 103 of these tests scattered over 15 northeastern states and Ontario have been reported and are summarized in the accompanying table. It is an interesting fact that the vast majority of these tests show responses closely parallel to the general average, despite the fact that quite diverse soil types are represented.

Perhaps the most striking feature of these results is the relatively large increase in both dry matter and protein in the case of the last two plots as compared with the plots which received only phosphoric acid or phosphoric acid and lime. One might conclude, from the frequency with which those treatments have been recommended, that pasture soils need little other than phosphoric acid and lime; but these results do not lend much support to that view.

The Three Staves

The failure of phosphoric acid alone to give a really satisfactory response should not be interpreted as meaning that pasture soils do not need phosphoric acid but rather that most of them need something else with it. Of course phosphoric acid alone cannot grow the desired amount of clover if clover growth is limited by shortage of potash, nor can it grow the desired amount of grass if growth of grass is limited by shortage of nitrogen. Presumably—though it was not covered in this set of test plots—neither potash alone nor nitrogen alone would have given any better response, if as good, as phosphoric acid alone. It is the old case of the barrel with three short staves. You simply cannot make it hold water to the top without fixing all three staves.

It is difficult to arrive at any satisfactory estimate of the cost of these treatments, since it is impossible to estimate with any degree of certainty how long they will last. Certainly the mineral part of the fertilizer and the lime will last more than one year—in all probability they will be showing results at the end of five years, though probably there would be a good response from adding more fertilizer inside of that time. I have in mind certain plots on which I applied a similar fertilizer in 1920 which still show a visible difference at the end of the tenth season of grazing, though they obviously need further treatment now.

There is no particular reason to assume that the nitrogen will last very strikingly beyond the first year, since the increased protein yield—329 pounds—seems to account fully for the 50 pounds of nitrogen applied. It doesn't need to last any longer to pay, as far as that is concerned, for it

made enough extra grass growth prior to the first of June to pay for itself in terms of barn feed saved.

I base that statement on thirteen plots which were harvested in late May with an average increased yield on the complete fertilizer plot of nearly 6,000 pounds green weight per acre as compared with the check plot. The plots with mineral treatment alone were not materially better than the check plot on that date.

My guess is that one can arrive at a pretty close approximation of the real annual cost of the several treatments used by spreading the lime cost over a five-year period, the phosphoric and potash cost over a three-year period and charging all of

5-8-7 potato fertilizer would be near enough for all practical purposes and it is easy to obtain. I have used it myself with good results.

Now just a word or two as to the economic adaptation of these treatments. In the case of every treatment, even the cheapest, the cost per pound of dry matter produced exceeded the cost from unfertilized pasture; but—and here is the point—in the case of every treatment, even the most expensive, the cost per pound of dry matter produced was less than half the cost in silage and green feed and less than one-fourth the cost in concentrates.

This seems to lead to two conclusions: first, that it is good business to fertilize the pasture insofar as fertilized pasture can be made to reduce barn feeding; and second, that one may use even the most expensive of these treatments, if it seems to be required, and still keep his feed cost way below that of barn feeding.

The great, big, inescapable fact is that a cow will harvest a crop and take it up to the barn a lot cheaper than hired help will do it. I used to think—and pretty recently, too—that it was the mark of a good farmer to grow hay and silage enough so he could barn-feed his cows as soon as the pasture got a little short, stable them very early in the fall and keep them stabled until very late before turning out in the spring. It isn't that sort of a farmer who is working his back harder than he is his head. It is the mark of a good dairy farmer so far as keeping feed costs down is concerned, to have pasture so good as to require but little supplemental barn feeding from early turning-out time until the time of severe frosts in the fall.

A "Lick" of Oats

WE don't like to have oats scarce around our place. We like to have oats to feed and oats to "throw away." In younger days every field

on the farm was taken diligently into account and every one was given just pretty near an even chance. But fields are like the people who sit the pews at church—their contributions vary widely when the "hat" is passed.

By degrees we came to the conclusion—and I admit that this conclusion should have been years earlier—we came to the conclusion that now and then it paid to give a none-too-good field the proverbial "lick and a promise." We have a field of thirty acres that we are going to give this lick and promise to this spring. To be sure, we plan a fair acreage of oats to be seeded carefully and fertilized adequately—but not that field. Too much work about the best time to sow oats on top of the ground with a fiddle seeder and leave it to nature tillage. Right around that date we shall have a peck of well-cleaned oats for each acre of the none-too-good field. Soon thereafter we shall turn over it again with alsike clover seed, timothy and a dash of red clover.

A good deal more than half of the time we have to harvest a crop of oats or other kind of a crop but when it doesn't look like that we graze it and clip it as it comes into head and let it lie. Year in and year out we find it pays us to give the fertile fields this lick of oats, some clover seed and promise of the plow in a couple of years. H. D.

Unfertilized plot photographed June 8, 1929. Yield of two cuttings, green weight, 8,167 pounds.

the nitrogen against the current season; but I want it clearly understood that it is a guess rather than an experimentally proved fact and that I have no evidence at all in support of that method of application as opposed to annual fertilization. In fact, I am rather disposed to favor annual treatment with something like the straight grass top-dresser fertilizers after an initial heavy application of fertilizer richer in minerals has been made.

I do believe, however, in the light of the striking clover response we obtained from a fertilizer rich in both phosphoric acid and potash, that it is good business to start the pasture fertilization program with something of about the 5-10-10 ratio. A

Average result of First Year of 103 Top-Dressing Tests on Permanent Pasture in 15 Northeastern States and Ontario

	Lbs. dry matter per acre	% protein	crude protein per acre	Total Increase	Total Incr.
Untreated Check	1051	16.5	173		
0-10-0 1,000 lbs.	1392	341	16.9	235	62
Lime 1 ton	1518	497	17.4	269	96
0-10-10 1,000 lbs.	1850	799	19.1	353	190
Lime 1 ton	2501	1150	20.1	692	329
5-10-10 1,000 lbs.					

*Equivalent to 625 lbs. of 16 per cent superphosphate.

This plot was top-dressed on April 30, 1929, with a 6-8-6 fertilizer at the rate of 400 pounds per acre. The photograph was taken June 8, 1929. Yield two cuttings, green weight, 14,823 pounds.

This plot, which received 800 pounds per acre of a 6-8-6 fertilizer, yielded 19,058 pounds, green weight, at two cuttings.

This livable pergola adorns a blank wall space. It cost about \$15, the owner building it himself.

NINETY-SEVEN and six-tenth miles—accurately automobile registered. And every place along that prominent highway, leading by sunny fields and wooded dales, that I saw trellises and lattice nooks I realized how they can transform homes by lending additional charm to already attractiveness.

Cleverly placed about the porch, or doorway, or window, or on the lawn—some day I'm going to see a pretty latticed summer house, a pergola even, in every farm garden. I hope—trellis and lattice adds marked interest to the very character of the farm. To me it produces such a gay, light, livable appearance without vainness, that before I have met them I just know, somehow, that the folks living there are wide-awake and have fine taste.

Trellis and lattice work has a still further practical advantage. It is inexpensive, considering its contributing value. The pergola where the young girl stands, for instance, cost only about fifteen dollars—some few dozen gallons of gas.

Seclusion and Shaded Light

And so it isn't strange that this particular type of style-ing is being favored on real every-day farmers' farms. While we are so engrossed "playing up" with improved plantings and buildings, modern machinery indoors and out, and working up color otherwise in and outdoors we aren't losing sight entirely of this improvement.

Fortunately we in farm homes in the main do not have to worry or hesitate about adapting this or that type of trellis or lattice work to our houses for fear it would be inappropriate—rather few of us live in Spanish or Georgian or Italian type houses, that must be specifically played up to.

However, choosing is a matter for thought, withal, since there are so many lovely trellis and lattice work creations, structures offering themselves, modestly as to finance, with a real flair for our homes. Some are square-headed. Some are arched. Yet others square-headed with arched openings, and arched heads with the lattice filling the space being sometimes only one-quarter by

seven-eighths inches thick, and in any number of patterns with pleasing scale variation.

Visualize brick-house homes in the country—they are all about us. What relief their dense weighty appearance is given by erecting trellises of varied shapes with varied openings—the whole in a light, dainty mode. I know an old brick farm house far out in the fields that was built by a Colonial settler as an exact copy of a Southern manor house he had fallen in love with. The quaint lovely lattice-work about the wide balcony is at once arresting and fancy while practical and guarding. It reminds me of a species of exquisite needlework known as ladder stitch.

Speaking of lattice work for porches, on a projecting

New Clothes for Home Grounds

By G. SHOCKEY

back porch a farm wife when working desires seclusion and softened light yet with plenty of circulating air for herself during those hours, and for the children playing there. So the lattice is more closely set upon somewhat sturdy frame and of somewhat thicker "stock." Again, porches afford means for trellis expression. Slats may run diagonally, or vertically and crossed horizontally. These provide admirable supports for vines and tall growing flowers, while secluding shadingly, comfortably as well. These should be so constructed and erected as to permit of laying aside or temporary removal for emergencies such as painting, repairing, etc.

What could possibly make for a more decorative "Mason-and-Dixon line," so to speak, between lawn and vegetable garden on farms than a neat, substantial lattice fence? It shouldn't cost prohibitively; at any rate, results will pay for the latticework. I prophesy, especially if strong posts and thicker stock—durable material—be employed in the making.

And summer houses about the farm home. They serve the farmer and his family as refreshing relief from summer suns and soothing protection on dewy evenings. They should be built more simply, quite likely, than those designed for municipal

A porch trellis provides admirable support for vines and tall-growing flowers.

summer-house lovers, since this sort harmonizes all the better with our simple yet imposing atmosphere of the fascinating country in a striking "quality" manner. In truth, for the farm, "crazy" raked-wood affairs are out of time with our unaffected quiet nature surroundings. A frame for a farm summer-house might well enough be of trellis, which requires less latticing material,

A welcome retreat from the hot sun and an attractive addition to the appearance of home grounds.

letting vines add the criss-crossing touch in living green.

When the farmer, or a member of his family, does the building and finishing of any sort of trellis or lattice work, he salvages the contents of his purse heartily. And the size and choice of material for any such piece of beautifying improvement of farm lands reasonably governs cost.

Summarily, trellis and lattice work well built on the farm makes its mark in its own quaint, trim, light way so distinctively distinguishing.

Dealing with a Woman

QUITE unexpectedly through the death of a relative I came into possession of a small run-down farm last summer. Like most farms managed by elderly, retired, absent farmers the whole place had a seedy appearance. The tenant decided that if he had to deal with a woman he would have things his own way, so a few weeks after he heard the news he came in with some rules and conditions to lay down.

In brief it was to the effect that the household goods stored in two rooms must be removed and the rooms papered and cleaned up; two strings of tile to be laid, costing about one hundred and fifty dollars, and the rent dropped fifty dollars from what he had been paying.

"I'm not sure that I'm going to stay," he said, "but if I do I'll not pay what I've been doing. The buildings are gone to rack and ruin, the trees in the orchard should all be cut down, as they are fit for nothing, and there are no fences to speak of."

After he had finished his lengthy tale of woe I told him that I was by no means certain either that he would stay. It looked like a good place for me to live on myself. It is on a good highway, only two miles from the county seat, a few rods from school and the soil is productive. He argued that it would be foolish to do so and no money could be made, but I said we were not out to make money but to save money. The farm house has a furnace, both kinds of water in the house and is substantial.

It was interesting to watch his change of countenance as he begged to stay and offered more than his present rent. He said the apples alone often paid half the rent, and other things made it so valuable that he raised the price three times and asked for nothing but the two rooms papered. A garden for us is to be excepted in case we do rent.

It just goes to show that when people are dealing with inexperienced farm owners they try often to take advantage. He announced three times that he had offered his last cent, and then came back to argue that we should not put him off the place. If he does stay it isn't likely that he will try that game again. Farm Woman.

Lattice separates flower and vegetable garden and makes a most fitting background for an artistic lawn.

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Slocum Company

Synopsis

Toots Pouche, an orphan boy with no job, spends his last dollar to rescue a dog from a fight with a captive wildcat. The boy secures employment at the Broad View Hotel, a likely place run by a southern gentleman apparently more for love than for money, since it is evidently not a paying proposition. The Colonel dies suddenly after arranging for Toots to have his library. The boy and his dog are now part of the crew on Jack Rose's craft the Stingaree.

As guests of an explorer on an ancient craft, Toots and Rose are shipwrecked but manage to get back to the Stingaree. Toots has just learned that the boat is in her home port and he must look for another job.

with A, and you can show me where they are. Alcohol."

Tigert pointed out the various heaps where this might be found. Toots collected the bottles and carried them to the lowest shelf on the right of the door, where he arranged them in a file against the wall like spies about to be executed. Tigert watched him for a moment silently. "Look here!" he said, "we can't waste time this way."

"It'll save time in the end," said Toots. "That's what we do on board a boat, keep everything in its place so we can grab it with our eyes shut if we have to. When you've once got things right it's easy to keep 'em that way. Apples, dried."

Tigert pointed mechanically to a lot of small gaudy boxes mixed up with rope, rubbers and blacking brushes in one of the corners. Toots dealt with the dried apples with deftness, quickness and confidence, and when he printed a robust

The Cheerful Plowman

THE WHEELBARROW FOREVER!

THE high test gas with chug and flame put a Dabbin in the shade and showed him how a winning game is very swiftly played. A buzzing bunch of metal teeth has chased the flail from sight, while good old-fashioned sod and heath turned golf links over night. The roost where turkeys used to perch beside the apple tree is out of sight and in the lurch—all modern coops for me. The tractor has replaced the mule on all Missouri farms, and high wheeled cycles once the rule have lost all show of charms.

But new things come and old things go. Ah, let them as they will. This old wheelbarrow, strong and slow, it carries with me still. There are a thousand little chores about this place of mine, like moving bags and cellar doors, old rocks, and roots, and twine, where no machine however new, however up to snuff, however smart in form and hue, pink, lavender, or buff, can take the place of this old thing, this old wheelbarrow here; among old traps it is the king. I surely hold it dear!

It doesn't need a beaten path, 'twill squirm through gates and nooks, 'twill twist around a pile of lath and glibly cross a brook. It is the handiest device our good forefathers made, it operates upon the ice and in the sun and shade. A squirt of oil on New Year's Day, a squirt on June fifteen, a coat of paint in March, we'll say, and it runs smooth and clean.

Yes, buggies went the way of dew, and buses lost their caste, the sulky plow and shark-toed shoe are relics of the past, but ages come and say "Hello!" and ages say, "Farewell!" removing knickerknacks row on row from upland, glade, and dell, yet this old one-wheeled, two-benched rig retains its station here; it still will be a-going big on Judgment Day, I fear!

J. E. T.

A on a card and tacked it to the lowest shelf the Captain was visibly impressed.

They continued the work during intervals between customers. By noon such a change had been made in the general aspect of the store that Tigert did not want to stop. He suggested that they lunch there, and with unwonted liberality, laid out a box of sardines and a pile of crackers on the counter.

"If you spread some peanut butter on those they'll go good," he advised. "Wish we had some cheese, but that's all I can't bring myself to keep. I'd be a-bilin' of it the whole time, same's a mouse."

"Afraid of indigestion?" asked Toots, through a mouthful of cracker and peanut butter.

"Taint my stomach I'm afraid of, it's the profits," retorted the Captain.

If Rose was "close" Tigert was closer; but he was a hard worker and when he proposed that they put in a little overtime, Toots, pleased at the enthusiasm his plan had roused, consented. Later on they had supper, which bore a striking resemblance to the mid-day meal. Afterwards Tigert lighted several big lamps with nickel-plated reflectors. Toots was really too interested to feel tired. The kind of life he had led had given him plenty of endurance and his young muscles were like a cat's, not bulky, but of a whipcord quality. Tigert was much the more weary of the two when they quit.

"You'd better cut round to Daddy Simons before it gets later, if that's where you're goin' to stay," Toots got his duffle bag and went to the door. He hesitated a moment and then said: "I've got some money I'd like to put in a safe place. Could you advise me where to put it, sir?"

"Why not leave it in the safe here? How much you got?"

"Two hundred dollars."

TIGERT started and glanced at Toots curiously. A sudden sharpness in his small gray eyes. "You leave it here," he said. "That's too much to tote round. It'll be all right with me."

When he had deposited the roll of bills in the safe Toots wished Tigert goodnight and left the store. The feeling of melancholy that had been hanging over him all day, now descended unchecked and enveloped him. He missed the Stingaree's luxurious cabin and the free adventurous life aboard her. He missed Zach and big vain, companionable Rose. For the moment, rolling stone as he had admitted himself to be, he was sick changing from one thing to another. Sick of fighting for the meager living that it seemed was not his natural right. Everybody begrudged it to him and expected him to be grateful for the hard work they permitted him to do. He was born into indifference. His sorrows, pleasures, hopes, were less regarded than the dust in the road.

Toots was not really morbid and the mood soon passed. When he came to reflect upon it the prospect at the store was not so bad in one way. Tigert didn't like, but the process of creating order out of chaos appealed to him. It gave him a definite problem to tackle and Toots rather fancied problems.

The warm welcome that Daddy Simons and Nancy gave him helped to dispel any lingering sense of dissatisfaction, for the time at least. They were both congenial. Daddy was young for his age—he had married late in life—while Nancy was old for hers. Father and daughter were great pals. She was the best housekeeper imaginable and one of the daintiest of cooks. She had set aside a late supper for Toots, whose appetite had been merely whetted by the snack at Tigert's, and while he discussed the probable developments of his work at the store, Nancy was sure he would eventually become a partner.

"Not with Tigert," laughed Toots. "We don't cotton to each other a mite. What's wrong about him anyway, Daddy?"

"Nuthin' great, I reckon," said Daddy without much conviction in his tone. "He's a good store-keeper. Holds Carbury's trade an' makes money that is. He ain't a native son an' what he will before he come yere I dunno."

"I declare!" exclaimed Nancy with a pout. "Here you get a nice job right at home and the first thing you do is to pick holes in it. I s'pose you'll be running off again directly. What kind of a job do you want, Toots Pouche?"

Toots' eyes twinkled. "You know that book your father gave me?" he retorted. "About Darwin an' the Beagle. Well, now, that's the kind of a job I like, if you want to know. That's what I call a thinking job."

Daddy looked concerned, as if he regretted having presented the book to a young friend so visionary. "Darwin was a scientist, he wasn't a worker," he said. "Follerin' a hobby ain't the same as earnin' a livin'."

(To be continued.)

She Can Can

By GRACE VIALI GRAY

MRS. JOHN HVASS, living on a farm in Kennan, Wisconsin, knows how to can. She has proved this by coming out of the National Canning Contest as Grand Champion of Canners. This title was bestowed upon her because her jar of canned peas received the Grand Champion prize of \$1,250.

It was a great honor to receive this recognition, as 25,000 jars were scored in the contest. No small number of jars, this. You may think it strange that Mrs. Hvass won so large a premium on nothing but a jar of peas instead of a fancy pack jar. This just goes to show that the simplest thing, if done right, is worthy of recognition and high award. The judges were not looking for unusual things, nor were they looking for "packs" that required an undue amount of time on the part of the busy homemaker. They were looking for a perfectly-canned product available to any homemaker. It was perfection they wanted, not unusualness. And in Mrs. Hvass' jar of peas they found perfection.

And when the jar was traced to its sender, a modest woman, living in a simple home on a farm was found. Her kitchen is like thousands of other farm kitchens—she canned her champion jar of peas under the same conditions as you might, and that is why she is so human and of such great interest to all of us.

Pressure Cooker Again

There was absolutely no doubt but that the peas canned by Mrs. Hvass far surpassed all the other entries of the contest. They were as near like the natural fresh product as they could possibly be. On inquiry it was found that she had canned them in her pressure cooker. This may have been the reason why they were free from cloudiness, perfect in shape and true as to color and flavor.

At any rate, this is what Mrs. Hvass herself, has to say:

"I decided to can peas because I had a lot of them on hand. In canning my prize jar I used my pressure cooker, and all credit for winning the contest should go to this cooker. I have used it for my canning and cooking for a number of years. I know it has been the best thing that I ever brought into my kitchen."

Editor's note:—We have been tremendously interested in the splendid prizes won by many of our readers, and I am sure you will be, too, so here they are.

West Virginia

First fourth prize, \$50: Mrs. A. W. Henton, Minnehaha Springs, W. Va.—Peas.
Vegetables, \$25: Mrs. H. G. Sturmo, 406 Elm St., Harman, W. Va.—Carrots.
Meat, \$10: Mrs. E. P. Powell, Salem, W. Va.—Spring Chicken.
Fruit: Mrs. Powell Reynolds, Point Pleasant, W. Va.—Chickens.
Mrs. Cunn. McElwee, Minnehaha Springs, W. Va.—Peas.
Vegetables, \$5: Miss Powell Reynolds, Point Pleasant, W. Va.—Beans.
Meat: Francis Sutphin, Oak Hill, W. Va.—Chicken.

Pennsylvania

Vegetables, \$5: Mrs. Caroline Uphoff, Sewickley, Pa.—Pickled Beets.

The Farm Home

Only a Cold

By HEPSY NEFF

Treat Yourself to a Little Child

LAST year a childless couple in a comfortable country home stopped investigating and worrying and arguing about adopting children and treated themselves to a little, big eyed, homeless boy. Acting on the advice of friends they had his picture taken the day he came from the agency that placed him in their home. They listened to some good advice from the kindly man who brought the orphan, and then proceeded to be wise, gentle, considerate and loving parents. After a

It may seem strange to some of us that Arctic explorers count among the perils of the Far North the colds which they catch from white people at the trading posts or other places of fixed residence where whites live in heated houses. We have learned to expect the catching of smallpox or measles from being with persons who have these diseases and we shall be the gainer when we call a cold a contagious disease and keep away from it.

Tent dwellers have few of the diseases common to our warm rooms, first because disease germs cannot live but a few hours under direct sunshine

and second because the human body has its own defenses in the white blood corpuscles, the policemen of the blood as they have been called. A special force of these policemen are always, when we are in health, stationed at the gateway of the throat, ready to meet all invaders, and only a chill can drive them from their post.

Of course city people and all who mingle much with crowds constantly carry a variety of disease germs in the mouth and throat. If our resistance is strong we are protected against all invaders. The white blood corpuscles destroy them. Man has learned that he can keep the same even body temperatures whether in the Tropics or the Arctic; whether in Alaska or Panama. Everything depends on his clothing. Today the sanitarians of our northern states are filled to overflowing and have long waiting lists, mostly young women, suffering from tuberculosis. Physicians say this terrible condition is due to lowering the resistance of the body by too scanty clothing. Many of us know of such cases where help was sought too late. The remedy is preventive: keeping an even body temperature from head to feet. The cure is the early help of the best physician within reach.

The Kitchen Sink

PROPER care of the sink means a more efficient kitchen and pleasanter working conditions for the housewife, according to the New York state college of home economics at Cornell University.

To prevent clogging by grease, and to keep from needless labor in cleaning the sink, scrape all dishes and cooking utensils before putting them into the dishpan and wipe out greasy ones with soft paper. For this purpose, paper napkins are especially good, but paper towels and even newspapers may be used. If this plan is faithfully followed there will be no need of a sink strainer because the dish water will be free from crumbs and other solids and will not leave a greasy deposit around the sides of the sink.

Boiling water occasionally poured down the drain will help to keep it clear of any grease or other material which may have lodged there. If it does become stopped-up, however, use one of the commercial preparations on the market for the purpose, or dissolve one-fourth pound of copperas in two quarts of boiling water or one pound of lye in six quarts of boiling water and pour this down the drain. Then flush it with clear hot water.

Another method is to pour a gallon of boiling water to warm the pipe and then pour in one cupful of kerosene to form an emulsion with the grease in the pipe. After five or ten minutes flush the pipe with another gallon of boiling water. Never use washing soda or sal soda to clear a grease-clogged drain because it combines with the grease to form hard soap which takes a long time and many gallons of hot water to dissolve.

A piece of orange rind kept in the canister gives a delicious flavor to tea.

A few sound apples placed in the cake box will help keep the fruit cake moist.

Mrs. Hvass is careful to completely seal the jars after they are taken from the pressure cooker. Note the uniformity of the peas and the absence of cloudiness from the jars.

Cold in Head, Chest or Throat?

RUB Musterole well into your chest and throat—almost instantly you feel easier. Repeat the Musterole-rub once an hour for five hours... what a glorious relief!

Those good old-fashioned cold remedies—oil of mustard, menthol, camphor—are mixed with other valuable ingredients in Musterole.

It penetrates and stimulates blood circulation and helps to draw out infection and pain. Used by millions for 20 years. Recommended by many doctors and nurses. Keep Musterole handy—jars, tubes.

To Mothers—Musterole is also made in milder form for babies and small children. Ask for Children's Musterole.

Best Remedy for Cough Is Easily Mixed at Home

You'll never know how quickly a stubborn cough or chest cold can be conquered, until you try this famous recipe. It is used in millions of homes, because it gives more prompt, positive relief than anything else. It's no trouble at all to mix and costs but a trifle.

Into a pint bottle, pour 2½ ounces of Pinex; then add plain granulated sugar syrup or strained honey to make a full pint. This saves two-thirds of the money usually spent for cough medicine, and gives you a purer, better remedy. It never spoils, and tastes good—children like it.

You can actually feel its penetrating, soothing action on the inflamed throat membranes. It is also absorbed into the blood, where it acts directly on the bronchial tubes. At the same time, it promptly loosens the Kern-Laden sputum. This three-fold action explains why it brings such quick relief even in severe bronchial coughs which follow cold epidemics.

Pinex is a highly concentrated compound of genuine Norway Pine, containing the active agent of creosote, in a refined, palatable form, and known as one of the greatest healing agents for severe coughs, chest colds, and bronchial troubles.

Do not accept a substitute for Pinex. It is guaranteed to give prompt relief or money refunded.

YARN

COLORFUL WOOL For Boys, \$1.15 lb. Knitting Wool, at 10¢ lb. in 1 lb. balls. H. A. BARTLETT, Manufacturer, Harmony, Box F, Maine

A Dress for Every Occasion

No. 3274.—This pattern shows a swathed bodice with a rather long-waisted. The attached circular skirt is cleverly shaped to keep the hips flat with graceful fullness at smart and slenderizing. Style No. 3274 can be copied exactly for it comes in sizes 16, 18 years, 36, 38, 40, 42, 44 and 46 inches bust measure. Crepe satin in new dark brown shade with the bolero lined with the reverse of crepe is conservative and chic. Size 36 requires 4½ yards of 39-inch material with ¾ yard of 32-inch contrasting.

No. 3257.—The long-waisted bodice is fitted snugly through the hips with deep vest at front with becoming square neckline offering a definite change. The cape in revers and tied at end of V-opening. Style No. 3257 is designed in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Bottle green crepe silk is exceptionally wearable with vest made of self-fabric. Size 36 requires 4½ yards of 39-inch material with ¾ yard of 32-inch contrasting.

No. 3245.—Princess Silhouette. A brown and yellow-beige checked tweed that is outstandingly smart in Princess silhouette. Beautifully modified by long revers collar reaching to waistline. This surplice and one-sided effect of the bodice makes it equally wearable for the larger woman for it minimizes the width through the waist. Designed in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4½ yards of 39-inch material with ¾ yard of 32-inch contrasting and 2½ yards of binding.

No. 3247.—The jacket dress in Scotch plaided woolen is unsurpassed for the may be made at a very small outlay. It is sketched in beautiful red tones with deeper tones of plain red woolen used for applied band of collarless jacket which appears again in belt and binding of neckline of dress. The bodice that stimulates a tuck-in that is stitched to the skirt with inverted plaid at center-front is in red jersey in matching shade of background of plaid. Tweed-like cottons, wool crepe, tweed, flannel and linen suitable. Size 8 requires 2 yards of 39-inch material for jacket and skirt, ¾ yard of 35-inch material with ¼ yard of 39-inch lining for waist and ¾ yard of 35-inch dark material for bands, cuffs and belt.

No. 3246.—A most exquisite eggshell crepe satin blouse that boasts of its flattering neckline. The jabot frill is shaped at upper edge so as to lay perfectly flat with a soft rippling cascading fullness at either side. It is caught in under the applied shoulder yokes and finished with over-bow or as a tuck-in. Style No. 3246 comes in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. It can be copied with 2 yards of 39-inch material with ¼ yards of binding in the medium size.

No. 3269.—Tailored Frock. The tailored one-piece frock in printed wool crepe lengthened with kilted plaited flounce is a copy of an elder frock of sports character. It has a crisp pique collar and is belted at normal waistline. Inset pockets are placed at either side below the waistline. Style No. 3269 is as comfortable as it is smart and so easy for the little miss of 8, 10, 12 and 14 years to slip into. Size 8 requires 1½ yards of 39-inch material with ¾ yard of 32-inch contrasting.

No. 3237.—Costume Slip. A charming costume slip with a long-waisted fitted bodice, pointed at center-front, has an attached skirt that is fitted through the hips by means of pin tucks. It adapts itself perfectly to the new fitted lengthened silhouette. It has deep comfortable cut out armholes with the important V-outline at both front and back of upper edge of bodice. Style No. 3237 can be had in sizes 16, 18 years, 36, 38, 40 and 42 inches bust measure. Perforations are provided for lace trimming at upper edge and in bodice effect around skirt, or for the use of contrasting color. It is in peach shade crepe de chine with deep shade ecru lace. Size 36 requires 2½ yards of 39-inch material with ¾ yards of 2-inch lace or ¾ yard of 39-inch contrasting bands.

No. 191.—Style No. 191 comes in sizes 10, 12 and 14 years. In the 8 year size, it is made with 1½ yards of 39-inch material with ½ yard of 32-inch contrasting of plain taffeta for ruffles. The thrifty model for little daughter, a pretty dainty sprigged pattern is very effective for general wear. Light blue cotton pique, dark green plain crepe is effective. Wool jersey in Hunter's green used for entire outfit is attractive. Wool challis print is very dainty and quaint in yellowish brown tones with bodice, cuff bands and ruffling of plain challis in harmonizing shade. Sports weight linen in orange-red with white linen, sailor blue pique with white dots with plain blue pique, and French blue silk crepe with white crepe are admirable smart combinations. Size 8 requires 1½ yards of 39-inch material with 1½ yards of 35-inch contrasting with 2½ yards of plaiting.

measure. Perforations are provided for lace trimming at upper edge and in bodice effect around skirt, or for the use of contrasting color. It is in peach shade crepe de chine with deep shade ecru lace. Size 36 requires 2½ yards of 39-inch material with ¾ yards of 2-inch lace or ¾ yard of 39-inch contrasting bands.

No. 191.—Style No. 191 comes in sizes 10, 12 and 14 years. In the 8 year size, it is made with 1½ yards of 39-inch material with ½ yard of 32-inch contrasting of plain taffeta for ruffles. The thrifty model for little daughter, a pretty dainty sprigged pattern is very effective for general wear. Light blue cotton pique, dark green plain crepe is effective. Wool jersey in Hunter's green used for entire outfit is attractive. Wool challis print is very dainty and quaint in yellowish brown tones with bodice, cuff bands and ruffling of plain challis in harmonizing shade. Sports weight linen in orange-red with white linen, sailor blue pique with white dots with plain blue pique, and French blue silk crepe with white crepe are admirable smart combinations. Size 8 requires 1½ yards of 39-inch material with 1½ yards of 35-inch contrasting with 2½ yards of plaiting.

No. 159.—Princess Apron. It's alluringly smart in gaily patterned chintz in red tones. Plain binding in the deepest tone of print trims the open round neckline, deep open armholes and attractively shaped pockets. Shirrings at either underseam indicate normal waistline and hold the garment closely to the figure so as to retain its moulded waist and hipline. The skirt starts to widen below the pockets with a delightful circular flaring fullness at hem. It has matching cuffs too. It is so essentially smart, to carry out the semple theme. Style No. 159 comes in small, medium and large size. In the medium size, it is made with 2 yards of 39-inch material with ½ yard of 27-inch contrasting.

No. 3280.—Jacket Suit. Any young miss of 8, 10, 12 and 14 years would appear smart in this fashionable jacket suit. It is sturdy in navy blue wool crepe and practical as well. Printed rayon crepe in dark green tones in combination with yellowish green plain crepe is effective. Wool jersey in Hunter's green used for entire outfit is attractive. Wool challis print is very dainty and quaint in yellowish brown tones with bodice, cuff bands and ruffling of plain challis in harmonizing shade. Sports weight linen in orange-red with white linen, sailor blue pique with white dots with plain blue pique, and French blue silk crepe with white crepe are admirable smart combinations. Size 8 requires 1½ yards of 39-inch material with 1½ yards of 35-inch contrasting with 2½ yards of plaiting.

Five Minute Cabbage

THE most recent information we have on the occurrence of vitamins in vegetables, indicates that the vitamin C content is highest when the foods that supply this vitamin are used raw or cooked only a very short time. Cabbage is one of the best sources of vitamin C if properly cooked, or, better still, served raw. Those who like the crisp texture and pungent flavor of raw cabbage will find some of these qualities present in cabbage cooked just a few minutes in hot milk. The method of preparing it is described by the Bureau of Home Economics of the U. S. Department of Agriculture.

Three cups milk, one and one-half quarts shredded cabbage, one cup cream or rich milk, three tablespoons melted butter, three tablespoons flour, salt, pepper.

Heat the milk and cook the cabbage in it for two minutes. Add the cup of cream or rich milk, the blended butter and flour, and the seasoned cook rapidly for three or four minutes, and stir constantly. The result is cabbage delicate in flavor and color.

Cooking Wild Rabbit

If your family objects to the wild taste of rabbit, you can easily please their appetites by the following method. Wash and thoroughly clean two rabbits. Cut up and place in pan. Pour over it water to cover in which you have dissolved two level teaspoons soda. In twenty minutes, drain and cover with clear cold water. Drain again, and let stand over night in water slightly salted.

When ready to cook, drain—roll in flour and fry slowly to a rich brown in butter. Serve with brown gravy. Old rabbits may need parboiling first.

Care of House Plants

POTTED plants growing in the house may be kept in a healthy condition during the winter months by careful attention to watering, temperature, ventilation, sunlight and feeding.

The majority of house plants like a moist soil, says W. W. Wiggins, floriculturist at the Ohio Agricultural Experiment Station. Allowing the soil to become extremely dry each time before watering is not desirable. The plants should be given the proper amount of water each day to moisten the soil if needed. An excess of water is also very harmful. A hole for drainage should be provided in the bottom of the container. If the flower pot is placed in a jardiniere or saucer the water that drains from it must not be allowed to stand in the bottom of the container as it will water soak the soil. A temperature at night ranging from 55 to 70 degrees is satisfactory, but where the temperature drops nearly to the freezing point, the plants are severely checked.

Repotting house plants is often neglected. When the plant has filled the pot with a ball of roots it needs to be repotted. A good loam soil with an abundance of humus is satisfactory for most house plants. Feeding at frequent intervals with a liquid manure solution of nitrate of soda at the rate of a tablespoonful to a gallon of water will delay the necessity of repotting for a time.

Gas escaping from the stove is very harmful to some plants and is often the cause of their turning yellow or making poor growth. Good ventilation is as essential to the health of the plants as it is to the human occupants of the house.

During the winter months most plants need all the sunlight it is possible to give them, although the rubber plant, Aspidistra, Sansevieria, some of the ferns, and the like will withstand shade for a long time and still remain healthy and vigorous. A good general rule is to give all of the house plants all the sunlight possible. By turning the pot at frequent intervals the plant does not grow so one-sided.

The Question Box

DAR PENNSYLVANIA FARMER—I have been watching for quilt patterns like our mothers used to make. One I want so badly is the Irish Chain. If you can get it for me, please publish it in your paper.

A Reader.

This dear reader would have had a Christmas letter telling her "Yes" with the picture and prices if she had signed her name and written her address.

So here is the picture of the old-time favorite, and we can furnish the pattern immediately upon order. We have ready for distribution any or all of the following: Tree of Paradise, Pacific Queen, Star and Shield, Air Plane, Tulip Wreath, Sail Boat, Floral Wreath, County Fair, Ohio Star, Dutch Wind Mill, Country Wife's Puzzle, Letter Tray, Maple Leaf, Double Cross, Grandmother's Basket

Unbleached Muslin Aprons

These are three of our latest designs in the unbleached muslin aprons of good quality and will give excellent service. We are offering these at the very low price of three for \$1.00, all material sent postpaid upon receipt of price. Ask for Nos. 2011, 2012 or 2013. Address Embroidery Department, Pennsylvania Farmer, 7301 Penn. Ave., Pittsburgh, Pa.

and Irish Chain at 15 cents each. Also two 10-inch square quilting designs, Rising Sun and Harp of Erin—the two for 15 cents.

You may have a free picture sheet of these designs by sending a stamped self-addressed envelope to the Home Department, PENNSYLVANIA FARMER, 7301 Penn. Ave., Pittsburgh, Pa. G. S. S.

Eat Your Spinach, Dear

HAVE'N'T you often said that to the children, and applied the same remark to carrots, too? For children are often reluctant to eat these two vegetables so rich in vitamins and so healthful because the youngsters say that they haven't "enough taste."

One way to solve this problem is to add a dash of granulated sugar to the water in which these vegetables are cooked. It not only enhances and develops the flavors of these vegetables themselves, but it also increases their food value.

Try These

Carrot Boats with Spinach: Cook even sized carrots until tender in boiling, salted water with a dash of granulated sugar. Drain. Cut in halves lengthwise if very large. Scoop out centers of the halves and sprinkle the cavities with salt. Heat a can of spinach, season well with salt, pepper, butter, a little lemon juice or vinegar, and also a dash of granulated sugar. Then pile the spinach in the carrot boats. Stick a potato chip in one end to simulate a sail, or garnish with a sprig of parsley.

Spinach and Beet Mold: Cook a can of spinach with a dash of sugar. Drain, season well with butter, salt and pepper and pack while hot into a buttered ring mold. Keep hot while preparing the beets. Heat canned beets in their own liquor with a dash of sugar. Drain, chop and season well with butter, salt and pepper. Turn the spinach mold out onto a hot, round platter and fill the center with the beets. You may sprinkle chopped, hard-cooked eggs over the spinach ring.

Weatherstrips at windows will help cut down coal bills.

Light-colored walls and woodwork help to make dark rooms light and they also make rooms appear larger.

He bought Stock in a Fake Company

A Bell System Advertisement

A FARMER near Kiowa, Colo., was talked into giving his check for \$500 in the purchase of a certain stock. When this man's banker received the check he telephoned the farmer and told him the company was fraudulent. The farmer asked the bank to stop payment on the check. The banker did so. Saved by quick action over the telephone, \$500.

Lightning struck the barn of a farmer living near Clifton, Va. He immediately called the telephone operator. She summoned neighbors and called the nearest village for help. People came as fast as automobiles could carry them. The house and outbuildings were saved.

The telephone pays for itself many times over—in running errands to town, finding when and where to sell for the best price, in keeping in touch with neighbors and friends. No price can be put on the value of the telephone in summoning aid in time of emergency.

The modern farm home has a telephone that works rain or shine.

Gasson's Poultry Farms, Box 1, Versailles, Ohio

Epidemic in Flock

We are having an epidemic among our chickens. Never before have we had sickness in our flock, and I am at a loss to account for it. We seem to have two conditions. One condition, I presume, is a form of roup or bronchitis, although they do not act according to description of birds suffering from either of these maladies, as theirs is no running at the nose or eyes but rattling at the throat. There is no feverish condition and birds seem to want to eat up until the last, when they drop down and die in great distress.

Our feeding mash is composed of: 200 lbs. corn and oats chop, 100 lbs. wheat middlings, 100 lbs. wheat bran, 35 lbs. meat scrap, 35 lbs. fish meal, 10 lbs. oilmeal, 25 lbs. alfalfa meal, 5 lbs. powdered charcoal.

For scratch grain, two-thirds wheat and one-third corn. This is the feed we have been using since we confined the chickens this fall. Later on in this letter I will tell you what feeds we used while the chickens were on range this summer.

The second condition—chicken hunch up, close their eyes and remain that way until they die. And just before they die, perhaps a day or two, they roll their heads and act as though they were crazy, and they die in great distress. At the time I find them sick like this, I find no trace of diarrhea, but after a treatment of Epsom salts, they void a greenish substance sometimes frothy and white. This serious condition has been running for about a month, and up to date we have lost sixteen birds, mostly pullets, weighing as much as five pounds. All of our chickens are Buff Rocks.

Some of the chickens suffered so greatly that we chopped off their heads, they bled profusely, the blood was of a very dark color, and we have opened three of the chickens. One evidently was suffering from an enlargement of the liver, as the liver was five and one-half inches in length, but the other two had large dark livers and very large gizzards, but there were no spots on any of the organs, although in one hen I thought the lungs looked a little chalkish. W. F. M.

It would be well for you to send to Professor R. P. Tittler, Bacteriology Division, State College, Pennsylvania, two or three specimens which seem to be affected so that a thorough post-mortem examination can be performed.

The ration which you are feeding should be ample to produce good results. There is no change necessary in your ration.

Apparently some of your birds are affected with onchitis. As a treatment, we would suggest the following: A material known as cresatin may be used. This is a coal-tar derivative. One small drop is put into the windpipe of the fowl. This causes the bird to choke for a moment and then to cough out a long, stringy mass of pus and blood. Relief is noticeable almost immediately. The throat and mouth may be sprayed with cresatin in an atomizer. Usually one or two drops are sufficient.

The other condition in your flock may be due to chronic coecidiosis. I have nothing to offer as a treatment for this disease.

Overcrowding fowls, of course, is responsible for colds which may later develop into bronchitis. Some farmers have considered it wise to use range shelters. These provide ample roosting space and yet afford protection for the birds against the elements. These shelters can be cheaply and easily constructed and they may be moved from place to place.

H. C. K.

Glass Substitutes

Would like your advice as to how to apply glass substitutes to my poultry house, which has windows to the south and is already equipped with glass windows. Should the glass substitute be put on the outside or inside of the glass windows?

SINCE the purpose of the glass substitutes is to admit the ultra-violet rays of the sun which ordinary window glass shuts out, it follows that the glass substitute cannot be put either outside or inside of the other windows, but that the glass windows must be removed and the glass substitute put in its place.

The best way to do this is to make rough frames to fit the window openings and tack the glass substitute

over these, so that after mild weather comes in the spring the frames covered with the glass substitute can be removed and stored in a dark place to protect them from the destructive effects of the hot sunlight, and glass frames returned.

Others simply remove the frames from the window frames and replace with the glass substitute. With advent of mild weather, these window frames are removed and the openings covered with coarse burlap, with ordinary window screens or with old glass substitute in which the coating has shed.

Glass substitutes give best results when used on vertical windows, as life is very short on roof windows exposed directly to the strong sun and to pelting rain and hail. I. W.

Device for Killing Fowl

THE following is a handy, simple device which I have been using for some thirty odd years for killing chickens, hens, ducks, and turkeys.

Simply get a round hardwood block about two feet long and eight or ten inches in diameter and two large nails or spikes. Place the block in an upright position on the ground. Nails or spikes are then driven about half way on edge of block, one inch and a half apart.

In killing the fowl, it is laid on the block with its head extending between the two nails. The fowl is held with the left hand by both stretching the neck somewhat and head severed with one stroke with a sharp axe or hatchet. The fowl is then dropped in a small hole so as not to be bruised by jumping and flopping. By slightly tapping the nail, they may be opened or closed to fit the neck of any size fowl or chicken. W. H. Harrison

Early Purchase of Chicks

"ORDER early" is a slogan to heart, advises L. M. Black, Jersey extension poultry specialist who points out that poultry farmers are frequently forced to accept less-desirable, late-hatched chicks because of delay in ordering from hatcheryman and breeder.

The problems of when and how to buy chicks, and how much to buy for them are important, the specialist says, as success or failure often depends on the quality of chicks bought.

"As to the time of buying," Black comments, "one should consider the purpose for which the chicks are desired as well as the possibility of avoiding disease troubles by early brooding. It may be advantageous to buy two different lots so that production can be maintained during summer and fall months. Early hatched chicks are easiest to manage and are subject to fewer losses from coecidiosis and intestinal parasites. For egg production in New Jersey chicks should be bought after March 1st."

"In buying chicks, it is usually better to obtain them near home so as to avoid losses resulting from careless shipping. The interest which a local producer maintains in his product is worthy of thought. If there is a poultryman in one's neighborhood who is producing a good grade of chick it is well to patronize him."

"Poultrymen are often misled by low chick prices. One should consider the operations which have been followed on the farm where chicks are to be bought. Breeding practices, disease eradication measures, and useful management methods may be reflected in the price asked. A few more a chick, however, may mean several dozen more eggs a pullet when the chick is grown, as well as fewer deaths in the laying flock. The answer as to how much to pay for chicks is intimated in the old saying that 'a cheap chick is as good as a ten-cent hammer.'"

EVEN BETTER THAN THIS—EVEN RICHER IN VITAMIN D

"Pratt's New Vitamin D Baby Chick Food surely puts strong bone formation in the chicks. On May 22nd I put out 7000 chicks and they are already as big as the March chicks. I have customers that got 600 chicks and haven't lost the extra chicks we gave them to the hundred."

Minster Hatchery
Minster, Ohio

SUMMER SUN FOR WINTER CHICKS!

at 1/4 the cost and none of the bother of cod liver oil

You could take each of the new chicks, and give it ten minutes a day under a "sun lamp"—that would be no better than the splendid benefit in Sun-Vitamin D of feeding Pratt's Buttermilk Baby Chick Food, specially processed in sun vitamins.

What a difference Vitamin D is making in chick raising! Leg-lameness, slow growth, low vitality, crooked breast bones, small frames used to make a staggering toll of new chicks every year. Now the abundance of Sun-Vitamin D Pratt makes up entirely lack of sunshine suffered

by mid-winter chicks. Tens of thousands of poultrymen saw the difference last season. Let this season prove for you the profit in summer sun for winter chicks.

This sure, dependable supply of sun-vitamins helps chicks better than ever to get the splendid body-building nourishment from Pratt's. Money can't buy choicer ingredients.

Ground hulled oats; dried buttermilk; cooked wheat; sterilized bone meal; ground whole corn; wheat middlings; ground millet, rape, alfalfa

leaf and blossom meal. Do you know of anything better?

When the difference between the cheapest starting food and a good one like Pratt's is but a fraction of a cent per chick, is it worth while gambling? Bone, muscle, nerve, blood, feather, constitutional vigor and egg record in maturity all depend on those first few weeks of feeding. Think of it!

Nearly every dealer carries Pratt's. Write us for the official Pratt dealer nearest you. We'll send you FREE a copy of a new famous booklet—**RAISING BABY CHICKS**. Chockful of practical points.

PRATT FOOD CO.
291 Walnut St. Philadelphia, Pa.

PRATTS BUTTERMILK BABY CHICK FOOD

ROWING MASH • America's Quality Feed Line • LAYING MASH

This pile of 572 eggs represents the difference in laying between two flocks of fine hens, 100 in each flock—all Leghorns—all from the same hatch. One flock had Pan-a-min with their feed, the other did not.

THIS is a *Bulletin Announcement* of a laying competition conducted on our Research Farm. The two flocks had identical feed and care. They were equal in everything except that only one flock received Dr. Hess Poultry Pan-a-min with their feed. The laying competition continued 100 days.

The 100 hens receiving Pan-a-min laid 5882 eggs, the other 100 hens laid 5310 eggs. The difference was the very respectable pile of eggs shown above, at right—exactly 572 eggs.

**572 more eggs at 50 cents per dozen meant
\$23.83 more profit from the Pan-a-min hens.
Over 23 cents extra profit from every hen.**

Dr. Hess Poultry Pan-a-min (formerly called Pan-a-ce-a) is a conditioner and mineral supplement which keeps hens and pullets in laying trim. Add three pounds Pan-a-min to every 100 pounds of mash. The cost is one cent a month for each hen.

Pan-a-min does not take the place of feed, but no feed can take the place of Pan-a-min. Regardless of the feed you use, you will always get better results by adding Pan-a-min to the ration. You should be getting the extra eggs and extra profits. See your local Dr. Hess dealer today.

HORTICULTURE

Pruning Tools

If we could give our orchards and other trees constant care no pruning tools would be necessary. All of the pruning could be done by pinching off the buds as they appeared or as they started to grow in the wrong direction. At the best under these ideal conditions a good pruning would take care of all the pruning that would escape us at this early stage. Such close attention to this important work is not possible, and so it is necessary to have a variety of tools when pruning time arrives.

As a smooth even surface is what is wanted on the completed cut the knife is the ideal tool to prune with. A good hawk-bill knife cuts off the twigs and shoots with a sliding motion that does not crush the tissues. The pruning shears are a step further than the knife and they will handle small branches that prove too heavy for the knife to handle.

The two-handed shear is about the largest kind of shear that is needed for orchard work, for all of the branches in an orchard should be well within the reach of its three-foot handles. There are a number of pruning saws on the market. I do not think that those with double cutting edges can be used to good advantage in close quarters without injuring the tissue and bark on the main branches. One of the best saws to use for this work is the kind that has a stiff back with the blade set in like a hacksaw. In this kind of saw the blade can be turned in both ends of the frame and it will therefore get into closer places than any other saw and will give very satisfactory service under most conditions.

Touch Up with Paint
A good stout ladder such as is used at picking time is also needed to get to the higher branches. A ladder that has two wide flaring legs at the bottom and only a single support at the top will be found to be most useful in working around trees of any kind. This ladder provides a good solid base for the ladder to set on while the least amount of juggling is necessary while placing the ladder against a limb or branch high up in the tree.

When the larger branches must be removed in pruning work it is always a good thing to have a small pot of good thick white lead paint along to touch up the exposed surface of the limb that has been removed. It only takes a minute to do this work and as the tree will require two or three years to heal over such a large place a little paint may save a lot of work later which might be necessary if decay should set in before the wound has been thoroughly healed over.

In all pruning work some disposition must be made of the clippings and branches. In the older orchards the tops of the trees are too close together for such rubbish to be burned under the trees so it will be necessary to haul it out of the orchard in order to burn it. A low iron-wheeled wagon is just the thing for this work, as it is easy to load and unload and it will not rub the low hanging branches of the trees as it is driven about the orchard. If the clippings are removed at once as they are cut from the trees it will help materially in controlling aphis, especially if the pruning is being done in the early spring.

W. E. WIECKING.

A Shy Bearing Orchard

Kindly let me know through the columns of Pennsylvania Farmer what to do with my apple orchard of two hundred trees in order to get some profit out of it. They are ten or twelve years old and bear only a little. The land is a red shale or slate ground. Will pruning each year help the crop any? What time of year should it be done? What would you suggest to put on the ground, and how much? A. T. B.

THESE apple trees should be coming into profitable bearing, if they have received good care. Good care of an orchard is treatment which

You might think that I am a boy, but you bet not.

is adjusted to the conditions and needs of that particular orchard; it is not a uniform set of rules, to be applied indiscriminately. Hence, I suggest that you see your county agent, and ask him to arrange for an inspection of your orchard by the extension specialist in fruit growing; when he sees the trees he can advise you with some degree of assurance.

In general, good care of an apple orchard would include the following practice, with local modifications. Plow or disk in early spring, harrow until about June 1, then seed a cover crop to plow under the following spring, such as Japanese millet; or lay down a temporary sod in early spring, being a mixture of red clover, alsike, sweet clover, alfalfa, bluegrass and redtop. Mow this two or three times a season, leaving it on the ground as a mulch. Break this sod every three or four years and reseed, preferably after one year of cultivation and cover crop.

Use sufficient fertilizer or manure to secure an average terminal growth of six to fifteen inches according to variety. This may mean an application of three to twelve pounds of nitrate of soda or sulphate of ammonia per tree, the less the better, provided you get growth. This is applied preferably two weeks before the blossoms open. If a sod orchard, add an equal or greater amount of superphosphate; if a cultivated orchard, it is preferable to apply the superphosphate when seeding the cover crops.

The Main Points

Pruning may be done any time between leaf fall and blossoming. The main points in pruning young bearing trees is to cut out all dead or weak wood, all suckers and water sprouts, (except where a water sprout is needed to develop into a bearing branch) and to thin the branches and twigs so that the sun can strike through to all parts of the tree. It is better to cut out many small twigs on the outside of the tree, than merely to cut large limbs out of the center. Prune every year.

Secure the county spray service, through the county agent, as a guide to the most effective spraying. In general, these trees will need a "delayed dormant" spray applied as the winter buds are bursting, using a lime-sulphur spray testing 1.03 specific gravity; a "pink" spray applied just before the blossoms open, using lime-sulphur testing 1.008; a "petal-fall" spray applied just after the blossoms fall, using lime-sulphur testing 1.008 with arsenate of lead added at the rate of 3½ pounds to 100 gallons; and one or two similar sprays later. Nicotine sulphate may be needed in certain of these sprays, to control plant lice.

Be Kind to Your Horse

You wouldn't ask him to drag 40 or 50 pounds of rocks around for hours just for the fun of doing him work.

Then why ask him to pull a disk harrow that has a draft of 10 to 20 pounds more than necessary. "What him right? Get him a Clark 'Cutaway' Single Action Harrow. It has the lightest draft of any harrow on the market, 40 to 50 pounds lighter. We know that because they've told us so.

At least, investigate! Clip coupon for the coupon book, "Cutaway" Catalog of tillage implements. It's FREE. We'll also send you free "The Soil and Its Tillage." A book worth having.

Clark

Single Action Harrow. It has a draft of 40 to 50 pounds lighter than any other harrow on the market. It is built for better work and longer life. It has a heavy cast steel frame and heavy cast steel teeth. It is built for better work and longer life. It has a heavy cast steel frame and heavy cast steel teeth.

Truck Crops

By GILBERT S. WATTS

"FROM whom do you buy your seeds?" From the firms that have supplied me the best seed in the past. And that answer is not meant to be evasive. "Best" implies comparison. Each year it has been my custom with the more important truck crops to use seed from two or three high-class sources. If they are entirely and equally satisfactory no change is made. "New and improved" sorts, if they demonstrate apparent superiority in small scale tests, are given a chance the next year in sizeable plantings alongside the old standards.

This procedure; planting what was best last year from the same sources as last year, dropping out even slightly inferior stocks, bringing in recommended new varieties or selections as they prove superior, is some trouble. But it is the only way the market grower can be certain he is growing the best. Even small advantages in yield, quality, earliness or resistance to disease are important in commercial gardening.

But for the home garden there is little reason, unless it be the fun in making comparisons, why the entire supply of seeds should not be purchased from one reliable house. A number of these, including most of those on my list, advertise regularly in the Pennsylvania Farmer.

INCREASING recognition is being given to the necessity of better grading and packing on the part of eastern growers. The New Jersey Horticultural Society has announced a special meeting to consider this problem alone. It will be held in Trenton on January 17th. Nearby Pennsylvania growers cannot afford to be absent.

The Pennsylvania Vegetable Growers' Association, assembled in Harrisburg, will devote Tuesday afternoon, January 21st, to intensive discussion of marketing problems. This is a matter that must be faced squarely.

ALONG this line, as a result of recent investigations, the Pennsylvania Department of Agriculture has published a bulletin entitled, "Economic Trends of the Vegetable Industry."

Let us quote, "Apparently there is a ready market for greater supplies of Pennsylvania vegetables in the home markets, if the competition of outside states can be met as to market preferences for variety, grade, pack and type of container.... The competition from other states is becoming increasingly keen.

"Competition between the canned vegetable industry and fresh vegetables is becoming more keen each year.... Over a period of years, 1913 to 1928 inclusive, the trend in commercial production of truck crops for fresh consumption has been gradually downward.

"Carefully graded and well-packed vegetables in attractive packages are the most effective means of meeting market preferences." Food there for serious thinking on the part of market growers.

"SOW first week in June for fall use" read the instructions given by a Philadelphia seed house for growing Green Italian (Sprouting) Broccoli. Without doubt the planting time is correct for fertile soils in the Philadelphia district. But it is too late by a month for some of the cooler sections of Pennsylvania. One must be careful not to be misled by the instructions of a seed house whose experience is based on very different climatic conditions.

No planter was ever meant to be a Truck Horse

Cut out constant weeding and cultivating — Grow things this new, modern way under Gator-Hide!

DRUDGERY...the dull, monotonous drudgery of constant weeding and cultivating need no longer be a part of ANY planter's existence. For Gator-Hide Mulch Paper, among its other miracle-working qualities, reduces weeding and cultivating to the absolute minimum!

Gator-Hide stimulates plant growth by increasing soil temperature and conserving soil moisture. In actual tests it has increased the yield of various crops from 25% to 200%—not only increased yield but increased the QUALITY, too. See your dealer today. If he cannot supply you with Gator-Hide, write us direct. But see your dealer first. And send the coupon, without fail, for free booklet NOW!

Agricultural Engineering

Farm Machinery Survey

TWO years ago the Department of Farm Machinery at the Pennsylvania State College conducted a farm machinery survey to gather pertinent facts regarding the use of farm operating equipment in Pennsylvania.

Both the United States and State Departments of Agriculture cooperated in the enterprise. The survey was made by personal visitation to farms in certain locations of the state which were typical of those sections.

Bulletin No. 237 has been issued by the Agricultural Experiment Station, giving the results of the survey and a copy can be secured by writing to the Agricultural Experiment Station, State College, Pa.

While the bulletin gives much valuable data about farm equipment, attention is called to 75 tractor farms which were visited in Somerset, Westmoreland and Fayette counties. These farms averaged 86 acres in crops. These farmers stated that their tractors would last 10.5 years, although some of the tractors had been in use for over eight years.

Of these 75 farmers 64 said the tractor was a profitable investment. 10 said "no" to the question and one had not come to any definite conclusion on this point. On an average these tractors were used 36.6 days per year; 23 days at drawbar work and 12.7 at belt work. Silo filling, threshing and feed grinding constituted the major part of the belt work both at home and for the neighbors.

I had the privilege of reviewing the sales report of a large well-known farm machinery manufacturer last December. This sales report showed that slightly over 51 per cent of the total business for the United States on "field tools" was tractor drawn equipment. This indicates the trend in this country toward power farming equipment.

R. U. Blasingame.

"Buck Frame for One-Man Saw"

(D-627), consists simply of an old buck saw frame and a longer stick for the middle to fit the length of your five-foot or longer saw. Baling or other wires are then put across and twisted as shown to make frame tight and rigid. The reader who sent it in has used such a device for four years and it has proved both easy and efficient. Either of these devices can be made in a few minutes time, and we urge that you make one and have it ready when the need arises.

I. W. D.

Cold Weather Oil Trouble

MANY car owners still have trouble with their oil circulation freezing up in very cold weather. This is due to the fact that a small amount of water in the form of steam is one of the products of every explosion. Some of this steam works past the piston rings and condenses into water when it strikes the cold crank case walls, just as we can see it condense when it strikes the cold muffler when we start the car on a cold morning. This water collects at the bottom of the crank case and freezes and quickly clogs up the oil intake screen so that no oil can get through.

Most cars now have a crank case suction drawing this water vapor and some oil vapor through the air intake, and this seems to do away with the oil pump trouble. Where such crank case suction is not or cannot be put on, most of the trouble can be avoided by letting the engine stand a while until the water all drains to the bottom of the crank case, then loosening the crank case drain plug and letting a spoonful or two drain out, which will be mostly water and very little oil. Then be sure to tighten the plug and it will go for another day or so.

I. W. D.

Hydraulic Ram

THE hydraulic ram is a combined engine and pump. It is one of the oldest types of machines for lifting water to the farmstead.

As a rule the ram will pump from one-seventh to one-tenth of the water which flows through it. It is, therefore, not a very efficient piece of equipment, although the water is going to flow down the hill from the spring anyway, so why not use the ram? There is one thing to look for and that is to insure sufficient water for all needs before making the investment.

Suppose then we assume a spring to be flowing eight gallons of water per minute. This would be 480 gallons an hour or 11,520 gallons in 24 hours. One-tenth of this would be 1,152 gallons, for the hydraulic ram runs continuously.

Several of the manufacturers state that their rams can be employed to

"One Man Saw Device"

wards the operator. There are simple devices, however, which solve the problem very satisfactorily.

One of these is shown in the first diagram (D-617), sent in by one of our readers, and consisting simply of a flexible hickory pole about one inch in diameter and about 12 to 14 inches longer than the saw blade. Each end is then sawed in about four inches, wrapped above the cut with broom wire or baling wire, and then slipped over top of saw blade just behind the handles. This keeps the saw from buckling or swaying and makes a faster cutting and more satisfactory outfit than a regular one-man saw.

Another very simple arrangement

How hydraulic ram is installed. If it is not possible to secure enough fall from the spring to the ram without too long a pipe, a stand pipe can be placed in the line as illustrated. This brings the height of the spring water to the correct distance from the ram.

It's Things Like This That Make Threshing More Profitable

IT'S the hard jobs that really test a thresher. Any machine will work fine when conditions are favorable. But suppose the weather is against you, suppose the straw is long, damp and tangled, suppose you run into rank weeds or shriveled grain—that's when you need a thresher built for all conditions. One of the essentials in tough threshing is better feeding and better threshing action.

The Case Thresher is the only machine that has these two important features:

1. The feeder can be set to feed high or low to the cylinder. When in high feeding position, the threshing action of the cylinder is greatly increased—just what you need for tough jobs. In dry and easily threshed grain, you simply set the feeder to feed low to the cylinder.

2. Uniform feeding is assured by "volume" control at the straw shoes and upper feed rakes which comb out the straw better than can be done by hand.

The thorough threshing action of the Case feeder results in better threshing, separating and cleaning. Another thing—you probably have never seen a Case Steel Thresher that was completely worn out, yet the first steel machines were sold over 25 years ago.

There are extra profits to be made in threshing. This is explained in an interesting booklet, "Bigger Profits by Better Threshing," which will be sent to you free—use the coupon.

Three Horse Plow Hitch

I am enclosing diagram (D-737 and description of the plan I use for hitching three horses to plow or other implement. For double tree I use a 2-by-4 hardwood four feet six inches long, and for even a piece of 1-2-inch wagon tire or other strip iron ten inches long.

H. B. C.

WE are very glad indeed to get this plan, which is rather unusual for a three-horse hitch and apparently would make a closer and

"Novel Three Horse Plow Hitch"

more convenient hitch than the usual type, but saves little or nothing in total width. Where such a vertical even is used with a five-horse tandem hitch in ground containing much loose wet trash it would be likely to drag the trash along, but it seems that there should be little chance of such trouble with this three-horse hitch.

Good Plugs Increase Power

SOME tests recently made in one of the General Motors laboratories showed that an automobile engine in which the spark plugs had been used for more than 12,000 miles developed 31.2 h. p. when run at an engine speed equivalent to 20 miles per hour. The same motor run at the same speed with a new set of spark plugs produced 38 h. p., an increase of 6.8 h. p., or 21.8 per cent. This shows the importance of good plugs for increasing power and decreasing fuel consumption.

Quality Preferred

WHEN you go into town on Saturday for the week's buying, how do you go about it? The chances are that your mind is pretty well made-up—not only as to general description of the products you want, but as to the brand names. You'll mention familiar merchandise easily, naturally. Names of advertised goods.

You prefer advertised goods because you know you can depend on them. You save hours of shopping time in a year because you don't need to investigate or examine the things you want. You don't buy on suspicion—you buy with confidence—because you know goods that are consistently advertised must maintain consistent quality. It is ruinous for a manufacturer to turn the spotlight of advertising on an inferior product. And advertisers know it. Hence advertising is a guarantee of dependability.

Read the advertisements regularly. When you go to buy—be informed!

YOU CAN BE SURE THE QUALITY IS "AS REPRESENTED" WHEN YOU BUY ADVERTISED GOODS.

THE YOUNG PEOPLE

From the Devil's Backbone

THE following is part of a speech made by fifteen year old Walter Cogar of West Virginia at a recent celebration in his home town. His school teacher thought it good enough for publication in Pennsylvania Farmer and we do too. Editor, I am thankful that I am a boy and not a girl; that I am fifteen years old and not a hundred and fifteen. I am thankful that I am Dick Cogar's boy and that I have a good old dad and the best mother in Braxton county. (All boys have the best mother.)

I am thankful that I live on a farm and that I have all the good, wholesome foods that a growing boy needs, such as beans, potatoes, cabbage, apples, peaches, plums, milk, butter, cornbread, wheat bread, and buckwheat cakes for breakfast, and plenty of beef and ham gravy and cane molasses to make them slip down easy.

Take After Dad

I am thankful for a whole house full of brothers and sisters to romp and have a good time with generally. I am thankful that while some of the bigger ones make me step about pretty lively at times, yet there are younger ones that have to take orders from me when dad is not too close around. I am thankful that I have chores to do, but not all of them; thankful that I am bigger than Dave and can make him help get wood, feed and run around and also take his turn these cold mornings makin' fires; thankful for three dogs and a gun and that dad lets me go huntin' at night sometimes and that I get part of the money from the 'coon and possum hides we take in.

I am thankful that we live on the south end of the "Devil's Backbone." This only gives us a good chance to hold his Satanic Majesty down. You see there is a baker's dozen of us when we are all at home and we can make it right interesting for the Old Fellow when we all set our heads and feet both. (Most of us take after dad in our feet, and he wears number seven shoes and number twelve boots.)

I am thankful for the best neighbors in the world. My brothers and kinsfolks live all around me, some with big families and others just startin' big families. The Cogars certainly do believe in the commandment to multiply and replenish the earth, whether they keep any written by Moses or not.

Might Be President

I am thankful that I have to walk from Braxton clear over into Webster county to go to school, some two miles and a half, but the truant officer doesn't have to chase me out with a sharp stick; neither does the board of education haul me to the two-mile limit to force me to take "larnin'."

I am thankful that nobody can tell a boy to quit going to school. He can go right ahead from a Browns Mountain district school to college and Congress and the President's chair if he has the right kind of backing and backbone, and the stuff in him that they make congressmen and presidents out of.

I am thankful that it makes me sick when I hear people whinin' around about nobody havin' a chance in this country unless he is rich. Dad ain't rich, and just look what he is doin' for this rough neck o' the woods in Braxton and Webster. In twenty-five years more he and his kids and their kids can form a new county of their own—Cogar county—and that might swing the balance of power in favor of the party that seems to be indifferent about taking nourishment just about now.

I am thankful nobody knows what our family may do yet.

The first ten in line at the round-up.

I am thankful for the Stars and Stripes that float from the tall pole in front of our schoolhouse. Every morning when I get in sight of the colors being whipped by the stiff breezes something inside of me wants to holler out, "Hurrah for the flag, boys!" I am thankful that this flag stands for the greatest country on earth and that I am a citizen of that country.

I am thankful that I don't drink moonshine nor smoke cigarets. That's bad stuff for boys and girls both, and I mean to let both alone.

I am thankful that my teacher doesn't fool with either one, and I hope the board of education won't send us any teacher in the future that does. I have heard of lady teachers that like to sample both. I hope the good Lord helps them to get over it. It looks awful coarse to me, and I think a school teacher ought to be a walking example for his children.

I say, let everybody be thankful to the good Lord for life with all its blessings in a thousand ways.

BOOK PRIZE FOR BEST LINE

"Give us another limerick," everybody says, so here you are. Add your prize line, rhyming with the last word in the first line, hurry it back immediately to Young People's Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa. and perhaps receive the book prize.

A Sad Ending

There was a young lady of Kent
Whose nose was most awfully bent,
She followed her nose
One day, I suppose—
(Add prize line.)

MORE ABOUT KATE

The prize for correct answers and neatest paper in our recent "Kate" contest, goes to Sue Miller of Pennsylvania. Not only does she answer the questions correctly, but sends more questions for you to answer. A book prize will be sent to the one who sends the correct answers, accompanied by the best letter telling what you would like to find on the Young People's Page.

1. Kate leaves her throne.
2. Kate prepares a tonic.
3. Kate consists of many.
4. Kate is the reign of a ruler.
5. Kate gives and receives.
6. Kate doubles more than once.
7. Kate spots a place to live.
8. Kate is a salt of an acid.
9. Kate restores peace.
10. Kate involves in trouble.
11. Kate causes to stagger.
12. Kate conveys ideas.
13. Kate makes like the original.
14. Kate tames animals.
15. Kate sets apart for special use.
16. Kate turns private property to the public treasury.
17. Kate makes things more difficult.
18. Kate assigns things.

Send your letter to Puzzle Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

JANUARY
January, the first month of the year,
Brings all the children the best of cheer.
It is the month when skating is good,
Which every one would do, if he could.
It is the month when the snow comes down,
That covers all the fields now so brown.
And out from the shed comes every one's sled,
To have a good time until it's time for bed.
Chester Co., Pa. Beatrice Shreiner.

The Youthful Cook

T IRED of eggs? Well, try some of these recipes:—

(1) Serve the eggs on buttered toast with tomato sauce. Tomato sauce is made the same as white sauce except that tomato juice is used instead of milk.

(2) Make a white sauce. To it add the chopped whites of eggs. Serve on hot, buttered toast. Over this sprinkle the yolks which have been forced through a potato ricer or strainer. This is often called Eggs a la Goldendorf.

(3) Escalloped Eggs.—Cut the eggs in eighths. Make a white sauce. Make alternate layers of the eggs and white sauce and chopped meats—ham, beef, chicken. Cover with crumbs and bake in a moderate oven.

(4) Escalloped Eggs.—Make alternate layers of eggs and white sauce and sliced cooked potatoes or macaroni. In making the white sauce add a little cheese. Cover with buttered crumbs and bake.

(5) Slice the eggs. Serve on boiled rice with white sauce mixed with chopped meat.

(6) Chop the whole egg into fine pieces and add to a white sauce in which sardines have been chopped and mixed. Serve hot on toast.

(7) Chop the eggs into fine pieces and add to white sauce in which asparagus tips have been cut up. Serve hot on toast.

(8) Stuffed Eggs.—Cut in halves, remove yolks, mash the yolks, add melted butter, salt and pepper and re-fill the whites. Salad dressing may be added to yolks.

(9) Serve hard boiled eggs, sliced cold, on lettuce with salad dressing.

(10) Serve one half egg stuffed, using cheese with the yolk. Serve on a slice of tomato on a lettuce leaf. Garnish with grated egg yolk, slices of pickle and salad dressing.

(11) Chop hard boiled eggs, add to white sauce thickened by an additional tablespoon of flour and flavored with parsley and onion juice. Cool. Shape into croquettes, dip in crumbs, egg crumbs, and fry in deep fat.

PRIZE WINNERS

Vegetable Contest

Sara Jane Ochs, Elsie Brichner, Juanita Saffie, Kathryn Shank, Ella Martin, Wilbur Moxley, John Danko, John Macheski, Ella Lyons, Charles Duffy and Gordon Wells.

Coloring Spanish Dancer

Ruth A. Alexander, Gloria Herbol, Elsie Joseph, Densel McKinney, Christina Struppek, Jamie Woodfield, Opal Gosney, Minnie B. Varner, Camilla Custagnola and Mary Rabatin.

Washday

Gladys Heiple, John Schlosser, Margaret Krinck, Andrew H. Nissley, Martha Jane Vance, Dorothy Leona Sweeney, Melvin Reisinger, Eva Mary Brinton, Leona H. Guris, Grace Miller, Russell Delaney, Lillian Szymanski and Markaret Vandervort.

"Why does an Indian wear feathers on his head?"
"Why, I guess to keep his wigwam."
"Do you know Lincoln's Gettysburg address?"
"Why, he lived in Washington!"

Covered Wagon 4-H Club

LANCASTER county is noted for doing things in agriculture and they have added another achievement to their list. They have a 4-H Holstein Calf Club of seventeen members in the neighborhood of Goodville, which has one of the most unusual names of any club in the state—The "Conestoga" Calf Club. These calves, ten of which came from the neighboring state of New Jersey, will undoubtedly prove to be profitable investments for the young folks who joined the club. Much credit for the success of this club should go to John Styer their local leader.

The club started last January and held its first round-up in October at the New Holland Fair. The first ten prize winners are as follows: Claire Eby of Gordonville, R. D. 1; Erma Brendle of East Earl, R. D. 1; Cletine Sauder, East Earl; Grant Stoltzfus, Elverson; Henry Styer, East Earl; Mamie Martin, Goodville; Pearl Martin, Goodville; Elsie Metzler, Paradise; Ruth Styer, East Earl and Emory Stoltzfus, Joanna.

The club is organized, holds regular meetings, and in every way is trying to live up to the 4-H motto. Very few members have missed meetings. One or two have been of the one hundred per cent variety.

J. F. Klein.

Assistant state club leader.

Little Folks

Melba Hess and "Rose Marie" of Tioga county Pennsylvania

A Fine Dog

I am going to tell you about my dog. Her name is Blackie. She is a rat terrier. She will catch rats around the house and if they are in the ground she will dig them out and kill them. She will also kill field mice and ground moles. She once treed a ground mole in a bottle and we had to break the bottle to get it out.

About a week ago she holed a skunk under an old tub and it filled her eyes full of perfume. When we go to pick berries she always goes with us. She will speak for her dinner. I think she is a fine dog.

Kessel Burns,

West Virginia.

WHAT A MIX-UP!

Below you will find the names of some Presidents of our country but something is wrong with them. Can you put the letters in the right places and find who they are? There will be pencil-box prizes for the correct lists accompanied by the best letter. Address Little Folks' Corner, Pennsylvania Farmer, 7301 Penn Avenue, Pittsburgh, Pa.

End the Milk Losses

from faulty
udders and teats

YOUR best efforts to win big milk production can be quickly offset if you permit udder troubles to cause discomfort or stoppage. These sensitive tissues MUST be normal and comfortable or definite losses result. A few days' curtailed milk-flow may wipe out the month's profit of a good milker.

Swift, thorough healing means everything—with the daily milking program so vitally affected. Bag Balm, the great penetrating ointment, is designed for just the type of healing needed by these tender tissues. Compounded with this pleasant ointment is an antiseptic oil of marvelous penetration. This exclusive ingredient is used in no other ointment.

A quick healer
in all emergencies

For chaps, cuts, cracked or sore teats, for Caked Bag, Bunches and Inflammations of the udder and other troubles of the milk-producing organs Bag Balm brings quick healing results. For many external injuries healing is often accomplished between milkings. Bag Balm is also widely used for all farm healing and for many human uses. Keep a package on hand constantly. It will save you many a dollar. Remember, there is no profit in a cow with udder or teat troubles that hold up the milk flow.

Bag Balm—in the familiar 10-ounce package—is sold by drug, feed, hardware and general stores. If your dealer is not supplied, it will be mailed postpaid. Do not accept substitutes; they can not produce Bag Balm results. Write us for valuable new Cow Book. An authoritative treatise by a prominent veterinarian. Leading Herd in County.

W. T. Law of Harrison County, W. Va., and his high-producing herd of cows. Mr. Law's herd of 10 cows made the highest record out of 27 herds entered in the Harrison County Cow-Testing Association to July 1, 1929. Herd averaged 382 pounds of butterfat from 8,950 pounds of milk.

Farm and Dairy

By L. W. LIGHTY

IN reply to an inquiry, hay is very good for breeding swine. They crave it and should be supplied. They are very fond of legume hay. I could not determine which they preferred, alfalfa, clover or cowpea or soy-bean hay. The soy-bean hay they cleaned up the most completely, possibly because the stems were softer.

There is no doubt in my mind but hogs need this material when they cannot get on the ground for green things.

I usually would store a supply where it was accessible all winter, but on occasions this was not the case and I gave them mixed hay. It was surprising how much of this they consumed if none other was available.

Corn, middlings, oats if available, clover hay and skim milk put the sows in a fine condition and they brought good litters in the spring, and were able to supply nourishment for them. The skim milk was increased in farrowing time and the increase was continued as long as the little ones nursed the sow. Some of my friends who sell the whole milk are using dried buttermilk with excellent results to take the place of the skim milk.

It is of the utmost importance to have the sow in a good physical condition, otherwise she may not be able to supply the needed milk for the pigs and soon she will have a litter of runts, or most of them will be such. Many people feed too much corn to breeding swine because it is convenient. Corn is a very important ingredient and should be supplied, but it is just as important that the sow which is to give a big lot of milk, be fed a balanced and wholesome ration as it is to feed the cow that is to yield well in milk.

Doubtless the addition of some mineral mixture now available is helpful. In the earlier days I put before hogs a mixture of charcoal, ashes, salt, coppers and some clean red shale rock. This rock they always ate in the pasture and so I supplied it and they used up a quantity. Possibly the commercial mixtures are better than mine was, but my pigs made me money and that is what I kept them for.

He Has No Luck

A young man writes me from West Virginia that the fates are all against him, while a friend and companion of his has all sorts of good luck.

It is not for me to say that man is subject to good or bad luck or any luck at all, because the wise men have not agreed on the matter. The funny man, Will Rogers, says all he knows is what he sees in the papers, and what I know about this luck proposition is what I saw in my half century's observation.

My young friend cites the extremely poor luck he had with a lot of baby chicks, while his friends had

the best of luck at the same time with some heifers. Such happenings are discouraging, but I am wondering if this unlucky young man has tried to account for his friend's luck. Baby chicks that have no mother, a kerosene or coal stove need a mighty lot of attention. If they do not get it luck is so hard against them that most of them die. Sorrowful experience has taught me this. All livestock is dependent on us. If we do our utmost to know their needs and wants and supply them constantly and regularly just about invariably they thrive and do well. If we do the reverse, and try to escape the blame we ascribe to luck.

Ignorance, slovenly management, unwisdom judgment are the usual ingredients of bad luck. I had an on folks whose motto was: "We do today what you can put off tomorrow." They had a lot of luck.

I watched men who insisted on keeping scrub cows and a scrub mongrel swine and dunghill fowls. They were constantly afflicted with bad luck. I had my eye on one whose wives had excellent judgment but always when the wife would do suggestions the husband would do the reverse in his proceedings, and the doggone luck you never saw!

Putting it this way may not please my young friend, but I am reporting truthful observations.

Discard Not the Old

I write this at New Year. For the prints of the day one would think only the new is valuable and the old is worthless. No greater mistake can be made. In olden time work brought health and contentment, while the new and the modern brought the reverse. In the last two months I had an appalling lesson in this truth. Thrift was a commendable virtue far back as history extends, but squandering was a vice just as bad and is so today. Decency is a cornerstone on which civilization rests, while profligacy always brings demoralization to individual or nation.

Forgiveness and the order of the Golden Rule brought joy and peace to men and nations for all time. The rule of revenge, a tooth for a tooth, a life for a life, has brought devastation and destruction.

Let us not forget that the virtues of old are still virtues even though we have invented and use many new implements and methods. This is true with every one and on the farm. The basic characteristics that made our ancestors happy and respected citizens will do the same for us today.

Lately I read some of the things written about farm practice a

long time ago. Most of it is as true today as it was then.

It is well to give the new due consideration while we hold on to the old that has served the race for many centuries.

Value of Silage

Have you any statistics on the amount of money that may be made daily per cow by feeding silage? What is the fundamental benefit in having a silo? What make silos do you use? C. E. Walter.

CORN silage produces considerable more milk than the same corn harvested and fed dry. Nine different experiments in four different experiment stations show that in every case a hundred pounds of dry matter in a silage ration produced more milk than a hundred pounds of dry matter in a dry corn fodder ration. The following table shows:

Milk from 100 lbs. dry matter.	Silage Fodder	Ration Ration
Number of Trials	Lbs.	Lbs.
Wisconsin (Rpt. 1888), 3 trials	104.2	95.5
Wisconsin (Rpt. 1889), 3 trials	110.5	104.8
Vermont (Rpt. 1892), 1 trial	82.0	76.5
Penn'a (Rpt. 1893), 1 trial	111.9	106.3
New Jersey (Bul. 122), 1 trial	116.2	103.0
Average of 9 trials	106.0	98.6

At the Vermont station the green fodder corn converted into silage and fed with hay and grain produced 11 per cent more milk than the same amount of dry corn fodder fed with the same allowance of hay and grain. The latest experiment which has just come to my attention is one from Iowa. This is not mentioned in the table already cited above.

The Iowa experiments show that there was a remarkable increase in milk and butterfat from the use of corn silage as compared with the same amount of dry corn fodder. The corn silage produced 62 per cent more milk and 55 per cent more butterfat than the corn fodder as the following table shows:

Corn silage vs. corn fodder for dairy cows, Iowa, January, 1924 (Weaver, Shaw and Ely).	Production from 100 lbs. Dry Matter Consumed	Milk	Butter
Corn fodder	1429	158.7	5.9
Corn silage	925	256.1	7.2
Increase	504	97.4	2.7
	35	62.0	55.0

As a matter of fact the comparative returns for the corn silage was greater than that indicated on the table. The table deals with the fodder actually consumed. The amount supplied was far greater. A considerable amount of the fodder was wasted since the cows refused to eat the dry corn stalks.

Iowa also made a study of the returns per acre of the corn crop as silage and as corn fodder. Corn fodder is the term used to indicate the dried corn stalks with the ears on them. They found the yield of silage to be about eight tons to the acre and the cost of the silage was \$4.50 per ton. This gave \$36.00 per acre returns from the corn crop as silage. This acre of corn would yield 3.4 tons of fodder at \$5.05 per ton, which is the value found for the fodder. When silage is worth \$4.50 the 3.4 tons of fodder are worth \$17.17.

The great advantage of a silo is that it handles the corn crop in such a way that it is entirely consumed by dairy cows; there is also less loss through fermentation and the whipping off of leaves when the corn crop goes into the silo. Furthermore the silage is succulent and juicy. It sharpens a cow's appetite and it keeps her alimentary tract in better condition than does dry corn fodder.

Any kind of silo will preserve the corn crop in good shape as long as the walls of the silo are perpendicular and air tight. We have several different kinds of silos here on the college farm, for instance, wood stave, solid monolithic concrete, concrete blocks and tile. They all do good work in preserving the silage. I also know of numerous brick silos that are satisfactory and concrete stave silos of which the owners speak very highly.

A. A. Borland.

FEED TO-DAY -- MILK TO-MORROW

THE feed you give your cows to-day will be milk to-morrow; you can tell something about the quality of your feed by the weight of your milk pail. Remember, milk from a herd is practically the same in composition, day after day—but even on the same farm, raw feeding materials vary in nutritive value throughout the season.

For this reason it requires intelligent use of purchased concentrates to make up in the cow's ration what home-grown feeds lack. That lack must be supplied or production drops immediately.

Amco Open Formula Feeds will supplement adequately, yet without waste, each variation in home-grown feeds. With good clover, alfalfa, or even good mixed hay, Amco 20% Dairy provides all the digestible nutrients required for steady, heavy milk production.

With ordinary roughage, low in protein, you will get best production with Amco 24% Dairy. Where home-grown grains are available, Amco 32% Supplement most economically produces milk.

Ask your nearest Amco Agent for more information about these Open Formula Feeds.

The Story of Woodbine Farm

By W. D. ZINN

CHAPTER III.

THE close of the Civil War found much bitterness between the people of the North and the South. This ill-feeling was carried so far as to cause the division of churches and almost the disruption of communities. Both sides were represented in our community by radical leaders, who carried their sentiments not only into the churches, but into the schools as well. There being no free schools at that time, the only means of providing an education was through "subscription" schools. The war feeling being still at high-tide, the abolitionists would not subscribe to a school whose teacher was a secessionist and vice versa.

My mother was a Southern sympathizer but my father was known as a Union man. However, he was not an extremist. I am sure I speak the truth in saying that the slavery question never caused any trouble between my parents. Indeed, my father was so conservative that both his Rebel and his Union friends, when in trouble, came to him for assistance. Our geographical location had made it unwise to be an extremist on either side, because we might be surrounded by Yankees one day and by Rebels the next. But it was not policy's sake that caused my father to be conservative. Like Paul, he was willing to be all things to all men if perchance he might save human souls.

scribe to a school whose teacher was a secessionist and vice versa.

The Yankees hired a school teacher. His only qualification was that of having been loyal to the Union. He came to our house to get my father to subscribe for us children. Judging by his subscription paper, my mother decided that his spelling was bad and his English worse. Neither my father nor mother felt that they wanted to place their children under his tutelage. The Rebels also hired a teacher. He was a graduate of one of the best schools of the state. My parents were a unit in their decision as to which school their children should be sent.

Civil War Prolonged

One of the incidents that is still very vivid in my mind is the meeting of the Yankee and the Rebel school children on their way to and from their respective schools. On many days we fought the Civil War over again. "Here comes the Rebels!" was a common exclamation from the enemies. "You are a set of black Abolitionists!" was our prompt reply. Sometimes a battle ensued, not with fists and stones. There were no casualties, but often we had to retreat to a nearby spring to wash the blood from our faces and hands. One of the sad things about this matter was that, on the other side, were the children of my uncle—my father's brother.

To Escape a Whipping

How different the pupils of those days from those of the present, and how far removed the methods of study and teaching. In that school there were young men and women who must have been past 25 years of age. We were permitted, in fact required, to study alone. The teacher, seated on an elevated platform in the rear of the school room, knew that we were studying, or thought he did, only when our mouths were moving.

One day I had my lesson perfectly but I had to keep working my mouth else the teacher would punish me for idleness. Accordingly, I was repeat-

ing, "mum, mum, mum." Suddenly something happened that attracted the attention of the other children, who ceased to study while I continued to "mum, mum." The teacher said, "I will give you something to 'mum' about." The teacher was a cripple and walked on crutches. He started for the corner of the school room where he kept a good supply of hickory switches. Never did the thoughts come and go more quickly through my brain. My mind ran "on high" for a short time. "I can beat that teacher to the door," I thought and no sooner was it thought than done. A half mile race soon brought me home and I ran into the house almost out of breath. My mother said, "Willie, what brought you home?" I replied, "The teacher was going to whip me with one of those 'ox-gads.'" With an expression of sorrow upon her face which I shall never forget my mother said, "I hope my little boy did not run away from school?" To which question I was forced to answer in the affirmative.

The Rod Not Spared

My mother took me by the hand and led me out to the corner of the yard where a sweet-apple tree had been growing for many years. My father had pruned that tree very heavily a few years before and it had sent out a lot of water sprouts. I had hoped she would break off some of the smallest sprouts but instead she broke off the largest within reach and proceeded to give me a sound thrashing. "Will you go back to school now?" she demanded. Thinking of the reception that would be tendered me there, I answered in the negative. Thereupon she took me by the hand and led me back through the deep snow to the school house. Occasionally I played the part of a balky horse when I thought of the greeting I would receive. But my mother knew how to overcome that tendency on my part, for she had carried along with her some of the apple sprouts. On arriving at the school house my mother opened the door and bade me walk up the aisle. She then said to the teacher, "I have brought Willie back and I want you to punish him!"

Food for Thought

I thought I had already received all that was due me in the way of punishment, but my mother decided this would not atone for my breaking the rules of the school. The teacher therefore hobbled to the corner of the school room and got a real hickory switch. In the presence of my mother he gave me, as I remember it, the hardest whipping I ever received in my life. My mother thanked him and bade him good-bye. I sat down on the same seat I had occupied before running away and began to think. I thought slowly and soberly and decided never again to run away from school. I kept that resolution. What would have happened if my mother, angry because the teacher had attempted to whip me, had refused to send me back to school? I am sure I would not be writing this book today.

No doubt my readers would be interested in having a little more detailed information about this school room. The seats were made by splitting saplings in two and putting four or six legs in each piece. The top was dressed with a drawing knife or broadaxe. The seats were backless and all of the same height. Writing tables were arranged around the walls of the room, being set at an angle of about 45 degrees. The entire school practiced writing at the same time. The teacher called out: "Writing

hour," and we all scrambled to our places. The school opened at 8 o'clock and closed at 4 with three intermissions totaling 1½ hours.

The following are a few of the old copies: "Many Men of Many Minds," "Many Birds of Many Kinds," "Life is Short, Make the Most of It." While the pupils were writing, the teacher passed along behind them and observed their work. He often took hold of the end of my pen-holder and directed my pen, saying, "Make the letters this way!" Those who have had to read my writing know that either I had a poor teacher or I was a dull pupil, for I never learned to write well.

Recreation

Did the boys and girls have games in those days? Yes, indeed, but I do not recall that one school went well across the continent to play another, nor did they put in half of their time training for these games as is the practice in some schools now. Among the games for boys, the most cherished was that known as "Bull Pen." Two captains were chosen, who divided the boys of the school into two groups. They then "threw up" for corners. Those who won took the corners and the other side went into the pen. When the ball was thrown and missed the mark, a boy on the opposite corner was supposed to catch it. Failure to do so caused him to stand aside. When a boy was hit with the ball he was said to be "out." The boy who was most successful in dodging the ball eventually won the game. We often played baseball very much like the boys do now, but we never went wild over that or any other game.

Even if we had had no games, we would not have suffered for the want of exercise. Before we went to school in the morning and after we returned home at night we had wood to chop, cows to milk and pigs to feed. Some one has said that "all work and no play makes Jack a dull boy," but, on the other hand, all play and no work makes Jack a worthless man.

Educate the Girls

If I were a millionaire and had a dozen boys I would teach all of them to work. Our parents allotted to each of us certain work to do during the school term. We felt just as much responsibility for doing these tasks as we did for preparing our lessons for the next day. With only a three or four-months term of school we could not afford to study only in the school room. I am sure that I received more than half of my text-book education at home.

There is a verse that runs:

Backward, turn backward,
Oh time in your flight,
Stake me a child again,
Just for tonight.

If it were possible by the saying of this to have it come true, I would leave off the phrase, "Just for tonight." I would like to come up through life with opportunities such as have the young people of today. As it was I was fortunate in having an educated mother, for which I am duly thankful. That is the reason why, in all my talks to farmers, I have urged them to give their daughters at least as good training as they give their sons. If either is given a preference, the daughter should have it. Much depends on the proper education of the girls of our land. Among other reasons for this is that the child spends considerably more time with its mother than it does with its father. If I could send out a radio message to every parent in the United States it would be: "Give your daughters the proper training and the future of our country will be safe."

~for Better Work
at Lower Cost!

Cletrac

MORE and more farmers every year are profiting through the use of this modern, more efficient type of farm tractor. Soft fields, steep grades, heavy loads—many factors that have placed the power farmer at a disadvantage—are easily overcome by Cletrac. With this powerful unit and its positive traction over any footing, farm work is completed on time—almost regardless of weather conditions.

The big program of Spring work lies just ahead. Why not, this year, let Cletrac's broad crawler tracks give you an earlier start on the plowing job? Why not have the advantage of easy control and comfortable "on-the-level" riding—a perfect seed bed, uniformly deep—an economy of gas and oil that saves many dollars annually—speed that gets work done on schedule—these and many other features are yours—at the very moderate cost of a Cletrac Crawler Tractor.

Built in a complete line of models from 12 h.p. to 100 h.p. and priced as low as \$1095 F.O.B. factory. Mail the coupon for catalog and address of the nearest Cletrac dealer.

Why
Magnetic Force
 is used in the New
De Laval
Magnetic Milker

In the new De Laval Magnetic Milker the important function of creating and controlling pulsations is performed by magnetic force.

There is no other method so perfectly qualified to meet the requirements of milker pulsation control, for magnetic force possesses everything desired—unfailing dependability, sensitiveness, instantaneous response and simplicity of adjustment.

Perfect, uniform, fast and regular milking is largely dependent upon pulsations. They must be regular and absolutely uniform. Irregular pulsations have the same effect on the cow as a change of hand milkers. Through the use of magnetic force, timed positively, the milker obtains the milker ideal for small herd owners with whom price is a limiting factor. De Laval Utility units operate on any single pipe line, a fact of importance to dairymen who want the advantages of De Laval milking, but who feel that they must retain a part of their original investment.

Free Trial

A trial of a De Laval Milker places you under absolutely no obligation. See your De Laval dealer or send coupon for complete information.

VETERINARY

By Dr. J. F. SHIGLEY

STIFFLE OUT

Have been reading with interest the questions and answers concerning the problems and ailments of stock. A month or more ago when I brought the cows to the barn for milking I found one with the stifle out. We put it back in place and bathed it with salt and vinegar and the cow seemed to be all right again. But about every two weeks or more it comes out. Is there any way I can keep it in?

C. J. Wilcox.

It is possible that the application of a blister may help this cow's stifle. However, too much should not be expected as the frequent slipping out of the stifle tends to reduce the possibility of its return permanently. Your veterinarian can be of service to you in a case of this sort.

UDDER LEAKS MILK

I am writing you in regard to a heifer. She will be two years old soon and is due to freshen. This heifer is large and well developed, as she has been well taken care of. She has sprung for the first time about three or four weeks ago. What udder she developed was as large as a two-quart crock. It doesn't go down any and when she comes from the field in the evening the milk runs in a stream from both hind quarters. She has never been milked.

J. M. Allison.

It is not a wise policy to milk the cow before freshening. If the heifer continues to leak milk after freshening, it may be possible to control the condition by an operation. Your veterinarian should take care of such measures as are necessary to affect an improvement in the condition.

PIGS CANNOT WALK

I have two pigs about three months old. Ever since they were six weeks old, they haven't been able to walk on their hind legs. Just slide along on their sides in the back. Fred Straub.

Give one teaspoonful of cod-liver oil per day per hog, mixing it in the feed. Add tankage or fish meal to the ration. Allow exercise in the sunshine.

WARTS

I would like to read your remedy on contagious warts and scaling around eyes. One cow broke out in the face with warts. Soon several others began. Now about seven out of 25 show infection. Two or three weeks after warts appear somewhere on the body the hair around the eyes comes off for about three inches, leaving the hide looking like it had been covered with a talcum powder. After the warts are a month old they show white. Is this a quarantinable disease?

M. P.

It has been suggested that warts appear as the result of an irritation due to parasites. It is a known fact that warts may appear where there has been an injury. Scrapings may be made by using a sharp knife and scraping deep over the affected area. Such scrapings may be sent to the Bureau of Animal Industry Laboratory, Box 403, Harrisburg, Pa., for diagnosis.

HORSE UNTHRIFTY

I purchased a range horse last winter but have been unable to get him to eat right. Several have examined his mouth and pronounced his teeth all right, but he just minces at corn on cob and whole oats. Have tried shelling his corn without better results. He drinks sparingly, has a cough, particularly while and after drinking. He rubs his tail and last few days acts like he has a touch of colic.

E. C. B.

A VETERINARIAN should be called to examine this horse. It is possible that there is an enlargement of the glands of the throat either in the nature of a goitre or enlargements developing as a result of strangles or influenza.

A diagnosis of worms can be made either by examination of feces for eggs or by finding worms in the feces. Washing the body with a solution of dip, repeating in seven to ten days, will rid the body of lice. The stall should be sprayed with dip solution at the same time.

HYSTERIA

I have two hound pups eight months old which seem to be all right, but times will suddenly start to bark and run around in a ring and froth at the mouth. Seem to be bewildered. Is this wrong?

G. W. Shigley.

One should be suspicious of sites as a possible cause. It is also possible that foreign food, starchy foods, limited ration and close inbreeding may be factors. Would suggest that you take two dogs to your veterinarian for treatment. Such an office call is not an expensive proposition and will serve to check the condition or promptly.

HEAVES

Have a horse that got the heaves last spring. What can I do for him? At times she is pretty bad.

G. D.

The morning and noon feeds consist largely of grain. The bulk of the hay should be fed at night and it should be clean and free of dust. The bowels should be functioning properly. Stimulation of the digestive tract may be expected if grass is allowed. Oilmeal or bran may be of value. During the heat of day this animal should be allowed rest, if at all possible.

UDDER TROUBLE

Will you please tell me what is trouble with my cow? She had a fever five years ago, but got over it. Four years ago she got over it. The milk leaked out for years, but never seemed to hurt her. Then for about two years the milk has been growing up. Last September she came fresh again and well until about a month after freshening when one old morning I found her standing and shaking as if she were in pain. The last month or two she has just stands or lies around, seems to have no ambition, and her milk is yellow like a fresh cow.

M. P.

It is suggested that this cow be milked on a milking schedule of times daily for a period of two weeks. It is possible that this may clear the udder condition. It would be to have your veterinarian examine the udder to determine the condition of the quarter where the teat was off. Foreign bodies in the teat or second compartment of the teat each may be the cause of trouble.

RUPTURE

I have a fine horse colt that seems to be a ruptured inguinal hernia. The lump is in the side of his sheath. The lump is the size of a small coffee cup. With the one can push the lump back. Do you think anything can be done for it?

G. W.

This is known as an umbilical hernia or hernia. An operation can be performed without cutting the skin. Your veterinarian will be able to care for this condition. It is a full whether a bandage would be successful. It might be used, however, for a time in which case a bandage could be placed in the inguinal directly over the rupture to keep back into position.

EGGS

BARRED ROCK EGGS, winners, \$1.00; L. G. Tyman, Scot Run, Pa.

WANTED—Hay, Grain, Potatoes, Apples, bales, Carrots, etc. Hay highest prices. Alfalfa hay, clover hay, for reasonable prices. The Hamilton Co., New York.

WE BUY or HANDLE on commission all hay and straw. George E. Rogers & Co., 1114 E. 10th St., Pittsburgh, Pa.

TOBACCO

NATURAL LEAF TOBACCO—Guaranteed 3 lbs. \$1.00; 12, \$2.00; 25, \$3.50. Pipe Free. Day when received. Farms, Murray, Ky.

HOMEPATHY TOBACCO—Guaranteed 3 lbs. \$1.25; 10, \$2.00. Smoking, 3 lbs. \$1.50. Day when received. Farms, Murray, Ky.

Exactly what do we mean by "success in baking"?

Sometimes when we speak of "success in baking" we mean merely avoiding failures. That's an important matter, certainly. It's so important that Pillsbury spends thousands of dollars testing Pillsbury's Best Flour—testing it by daily baking, by every scientific method known, to make sure that every sack is just like every other sack—that it will work perfectly for any baking purpose, bread, biscuits or pastry.

But there's another kind of baking success which is more than a matter of dodging failures. It is an achievement—*perfect flavor*, that small but all-important improvement in taste which is the mark of real success in baking. Women whose foods have this delicately richer flavor have learned to follow one important rule. They select ingredients with greatest care (flavorings, shortening, etc.)—and they

use a flour that is *rich* as well as dependable—Pillsbury's Best. Pillsbury's baking chemists have discovered one secret of finer flavor. They have found that there are certain blends of wheat which make a richer flour—and that foods baked with this richer flour have a better flavor. Pillsbury's Best Flour is milled only from this carefully selected, plump, full-flavored wheat. It gives you double value—dependability, *plus perfect flavor*.

Isn't it worthwhile to have this double quality? To know that your flour will never cause a baking failure—and more than that, to know that all your foods will have that delicately richer flavor that is the mark of finest baking? Simply be sure to get Pillsbury's Best Flour—all good grocers have it. Ask for it by name—for better flavor and more certain success in all your baking!

ORANGE SHORTCAKE

2½ cups Pillsbury's Best Flour ½ teaspoon salt
4 teaspoons baking powder 1½ cups shortening
1 cup milk

Sift together the flour, baking powder, salt and sugar. Work in the shortening with the tips of the fingers. When flaky add the milk gradually, mixing with a knife until a soft dough is formed. Turn out and transfer dough to two oiled square layer cake pans and flatten down even. Bake in a very hot oven (450° F.) for twenty-five minutes. Put together with sugared orange sections. Cover with sweetened whipped cream and garnish with orange sections.

Recipe furnished by Mrs. Ida Ball Allen, President of the National Radio Home-Makers' Club. Hostess Mrs. Allen every Wednesday morning over the Columbia chain: 10:30 a. m. Eastern Standard time.

Sorry, Mr. Groundhog, you're 'way be- hind the times!

SIX more weeks of waiting before starting to prepare corn and oats ground? Your shadow doesn't mean that to a "Caterpillar" farmer, Mr. Groundhog!

For his tractor is bigger than handicaps of long winters—bigger than costly delays late springs used to mean—he can gain several valuable weeks.

Effective power! There's the answer. Generous engine power enforced by positive traction. No wasteful slippage. The tracks conquer soft spots—(their pressure on the ground is only one-fourth as heavy per square inch as a horse's hoof!)

Time-honored prophecies fail—former ideas of tractor performance change—when your farm work is trusted to a "Caterpillar" track-type tractor.

CATERPILLAR TRACTOR

What Is Farm Income?

By CHARLES H. WASHBURN

AT a meeting of extension workers held at Jackson's Mill, West Virginia, in October, it was stated that, according to recent investigations, the average West Virginia farm family should have approximately \$1,189 a year in order to live in an ordinary degree of comfort. It was further stated that a national estimate yielded practically the same figures; while the actual average income of a West Virginia farm family is less than \$639, the national average.

Forty West Virginia farm women made the estimate of the requirements of an ordinary family of five, and their budget is as follows:

Clothing, \$382.74; food, outside of farm produce, \$239.60; education, \$123.85; church, \$23.50; health (including a physical examination for every member of the family) \$62.50; miscellaneous operating expenses, \$169; light and fuel, \$105; recreation, \$68.50; and social activities, \$15; total, \$1,183.63.

There can hardly be any criticism of this estimate of the minimum sum needed yearly by the average farm family. But the amount used under each separate item may well vary in different families, and from year to year. I find that three if not four of the nine items agree very closely with my own family expenditure. However, it is not this budget, but the method of computing farm income that seems in question.

Sixty per cent over \$1,200

At the same meeting referred to above, Mr. H. G. Sturm, county agent of Harrison county, West Virginia, is reported to have stated that 60 per cent of the farmers of this county had an income of \$1,200 per year or more. This statement was given wide publicity in the daily papers and in the Pennsylvania Farmer; the figures given in the latter, under date of November 9, bottom of page 7, being "a net income of \$1,189, or more."

It seemed to me that the estimate of my good friend Mr. Sturm was a little too high, so I took occasion to ask him if he included income from oil and gas in his figures. He replied that he did. "For," he said, "it is what a farmer has to spend that must be taken into consideration." I am still inclined to differ from our genial and efficient county agent, though that difference is based on our respective conception of farm income. In a recent communication to the writer, Mr. Sturm says, in part:

"Our talks have been dealing with family income rather than that of farm income. . . . you have dealt with farm income alone." This, it seems to me, is a mere quibble, an attempt to muddy the water.

Now, what do we mean when we speak of farm income, or the income of a farmer? Do we not mean the proceeds from the sale of farm products and livestock?

Income from Other Sources

If we include royalties and rentals from oil and gas, should we not also include the proceeds from the sale of land; bequests from a deceased maiden aunt; returns, if any, from gambling on the stock market—though I am not aware of any farmer in my section "playing the market"—and the like? All these may be sources of income to a farmer, but are they farm income?

Farm income, as I see it, is derived solely from the sale of farm products and livestock. If timber is sold as a crop, with due conservation and replacement by planting, or seedling, then it may be regarded as a farm product. If it is cut and sold with no effort or intention to replace by planting or by natural means, it is mere "skinning" of the land, the proceeds can hardly be considered farm income. Standing timber is reported, I believe, in this state, at least in part

of the land; that is, really. The proceeds from selling anything that is a part of the land, such as coal, timber (except as before mentioned), oil, gas, stone, minerals, and the like, which is sold with no intention of replacement, or which cannot be replaced, I do not believe to be farm income. This is depletion, not production. To sell such things is like drawing a check on one's account in the bank; the proceeds of such a check can hardly be regarded as farm income.

When Surplus Is Invested

If surplus farm income should be invested in more farm land, then, it would seem, the proceeds from the production of the additional acreage should be regarded as farm income. If, however, surplus farm income should be invested in stocks or bonds, or in manufacturing or merchandising, it is doubtful, in my opinion, if the proceeds of such investment should be regarded as farm income. The funds thus invested have already been taken into account as farm income; unless invested in additional farm land, as stated before, I can see no reason why the proceeds from such investment should be regarded as farm income.

Let us suppose, for instance, that a farm is sold, and the money invested in a store. Would the profits of the store be farm income? If surplus farm income be invested in the same way, would the profits be farm income? I think not.

Yet, according to my good friend Mr. Sturm, "It is what a farmer has to spend that must be taken into consideration," apparently regardless of how the farmer gets it. On this basis Mr. Sturm may be right in his estimate of a \$1,200 yearly net income for 60 per cent of Harrison county farmers; though I am inclined to think his figures too high.

An Erroneous Impression

Many farmers have sources of income, large or small—usually the latter—outside of the farm proper. But whether that income is derived from an oil well or a gold mine; from labor on the local roads, or from selling books; I do not think it should be classed as farm income.

If a true appraisalment should be made of actual farm income; that is, from the receipts from the sale of farm products and livestock, with proper deductions for "overhead" such as interest, upkeep, taxes and the like, I do not believe that 60 per cent of the farmers of Harrison county have an income of \$1,200, or even \$1,189, per year.

The Good Hope community in which I live is considered one among the best in Harrison county. There are about seventy families in this community, of which between thirty and forty are actual farm families. I doubt, from the best of my information and belief, if more than one farmer in our community has a net farm income of \$1,200 per year. By net farm income, I mean farm income after proper deductions have been made for overhead, as stated before.

As I see it, my good friend Sturm's method of computing farm income gives a wrong impression of the production of farming. A net income of \$1,200 per year; what seems to the city man to be free "eats"; a house without rent; and all nature to receive in this looks like a foretaste of paradise to the pent-up urbanite! It is to correct this glamorous but erroneous impression that I am writing this article.

Gloom and Gladness

By FRANK K. RICH

DEACON HYNÉ gave Caleb Peaslee a questioning glance as he came to a pause near the field which the latter was busily harrowing.

"I'm glad to hear you whistlin' so cheerful this mornin', Kellup," he announced. "I caught a glimpse of you yesterday and you looked so forbiddin' and downcast I almost worried over it, but this mornin' you've chirped up like a bird." "I sh'd say."

"What a fool a man c'n make of himself," Caleb said, seemingly at random, the deacon thought. "All day yesterday I was in the dumps; no more courage to work than 'sif I'd never been workin'—and all on 'count of Latham Tyler. And I've known Latham and his ways ever since I was old 'nough to know anything. But I lean slow and hard, seems to me, sometimes."

"Latham?" the deacon wondered, and then—"I s'pose likely he didn't do much use in fall plowin'," he hazarded. "Or mebbe the ground didn't look right to him?" Caleb nodded. "Both," he admitted. "And other things, too. I was a fool to even listen to him." He went on, "and more fool to pay any heed to what he said. But he did, and it amounted to this: all day yesterday I didn't accomplish 'nough to pay for my food and bed, if I'd been charged for it."

Caleb Quits Work

"He came along," Caleb proceeded, "early in the mornin', jest as I come out with the hosses to start in harrowin' this piece of ground; and he sat down on that boulder there as 'sif he was a frog and went to croakin'." At first I decided I wouldn't pay attention to a word he said—but you can't shut out a steady drone of talk. I can't, anyway, and the first thing I knew I was gittin' discouraged. I do the best I could to keep on workin'."

"He picked up a handful of the soil and shut it in his hand to crumble it, and it made him think of a piece of ground he planted one year and never got his seed back—it was sour, claimed. Well, I knew, or ought to know, that my land ain't sour, but I let him talk drove all that out of my mind, seemin'ly, and b'fore he got through I c'd see that field comin' to sorrel as thick 'sif it had been sown there. He took up the better part of an hour gittin' me to feel that way; and then he started on the other side of the field."

"Fall plowin', now—he never done himself, 'count of not bein' able to do it any way except as a bill of exchange—you'd got to plow it again in

the spring, anyway, and why wa'n't one plowin' 'nough? And it didn't matter that in my heart I know, just as you do, Hyné, that nothin' mellers ground like frost workin' on it after it's been plowed in the fall. He talked so d'spondin' that by noon (when he got through talkin' and I took the hosses to the barn) I told my wife I'd got through in the field for the day and started to chore 'round the house for her, doin' things she p'inted out to have done—things that needed doin', of course, but nothin' you could figger much profit in, same's there is in fall plowin'."

Such a Difference!

"Not to go into everything he saw gloomy, I'll jest mention smut in wheat, so's it hardly paid a man to take the chance of sowin' it, and who the frost ketchin' beans and sp'lin' 'em, and the bugs eatin' 'taters so it cost all they fetched to save 'em—and everything like that 'til he got me where I'd almost a mind to try and find some other way to git a livin', even if farmin' is the only thing I know how to do—and some of the time I don't know that any too well, seems to me!"

"I kep' on feelin' that way 'till long to'rds evenin', when I took a little stroll out to the field again; and who should I meet but Uncle Thad Parlin—and the difference in the way he talked from what Latham did made all the difference betwixt me gloomin' and whistlin'."

"He was glad to see one farmer stirrin' 'nough to git some fall plowin' done, and he thought (and said) that he never saw ground look better or seem in better tith; and he thought seed wheat give a bigger yield than it ever did in his young days; due to seed 'slection, of course; and he figured if I seeded that piece of ground down in the spring I ought to git a hay crop as high as two ton and a half to the acre—all I'd have room to make on the ground, anyway, and mebbe more. And in twenty minutes he'd took away the d'scouraged mood I'd got from Latham—more'n that, he'd got me so heartened I c'd hardly wait for mornin' to git at the plowin' again. And you heard me whistlin' for jest one reason—because I felt like whistlin', and all on 'count of Uncle Thad!"

"I know," the deacon said. "There ought to be some way of equallin' up betwixt 'em, seems so."

"I wish they c'd do it by taxation," Caleb said. "Uncle Thad's taxes ought to be abated, 'count of him bein' an advantage to the town; and they ought to double Latham's—and even then they wouldn't offset the damage he does!"

REDUCE your COST per acre

USE
CONCENTRATED FERTILIZER
handle Only ONE Bag
instead of F O U R

It's Granular—flows freely

USERS SAY:

400 pounds of Nitrophoska produced 243 bushels of potatoes, whereas 1200 pounds of 5-10-5 produced 234 bushels. The part that appeals to us is the fact that with Nitrophoska there is only one-third as much fertilizer to handle.

Results obtained on corn, melons, potatoes, truck crops and tobacco were very satisfactory. We used three tons of Nitrophoska last year and are going to continue to use it.

—Morse Brosman, Ephrata, Pennsylvania

WHEN you see an airplane winging its way like a bird in the sky, or hear a voice from a thousand miles as though the speaker were by your side—then you realize that man is making tremendous progress.

But progress is not confined to transportation and communication. Progress in the production of plant-food for your crops is scarcely less remarkable. Nitrophoska is the modern concentrated fertilizer, just as the radio is the modern means of communication.

You can reduce your fertilizer cost per acre by using Nitrophoska—the modern concentrated complete fertilizer containing 60% of real plant-food (15% Nitrogen, 30% Phosphoric Acid, 15% Potash). It costs less per unit of plant-food, and you handle only one bag instead of four!

Nitrophoska is the proven economical fertilizer for potatoes, vegetables, pastures, corn and most other crops. Send at once for important free book and the name of your nearest dealer.

—SYNTHETIC NITROGEN PRODUCTS CORP.

285 Madison Ave., New York, Room 1733

The Modern Fertilizer for the Modern Farmer

AT YOUR SERVICE is the attitude of every advertiser in this paper. Write them about your needs. Mention Pennsylvania Farmer.

I offer you BERRY PLANTS at WHOLESALE

Don't waste time on ordinary plants. My Hardy, Northern Grown plants are bred and grown scientifically and then carefully selected, one by one for shipment. They are not taken from old fruiting beds, but are grown for plants alone. Set some of my plants this year, in both the older, well known varieties and the Newer Better ones, and assure yourself a giant crop of choice fruit that will bring premium prices. In addition to this extra quality I offer you real wholesale prices on a few plants or many.

PREMIER
Premier, the earliest June strawberry. "Frostproof," and will yield loads of fancy fruit very early, when market prices are highest. Plants are grown from selected, sturdy stock, guaranteed to satisfy.

LATHAM
Latham, the new red raspberry, yields extra-large, continuous crops. Will not "winter kill." Fruit ripens evenly, and brings premium prices. Every plant double-inspected and disease-free, very high grade.

CONCORD
Concord is the greatest grape grown. It is hardy, productive, and will grow on any soil. Proven good in every section of the country. Extra cool prices on guaranteed grade, 2-year plants.

ALFRED
The new "Blackberry without a core." The greatest blackberry ever introduced in every way. My plants are the highest possible development of the strain. Very hardy, productive and vigorous.

"Ethyl is
the best
farm hand
I've got"

WHY not put Ethyl to work on your farm? Thousands of farmers have found that it pays. It pays because with Ethyl in your car, truck or tractor, you cover more ground in a day! Reduced gear-shifting saves fuel and eases strain on the driver, with consequent increase in his efficiency. And you save time and money through less frequent lay-up for carbon removal.

That's because Ethyl is good gasoline plus the Ethyl anti-

knock compound, which was developed by General Motors Research Laboratories to make gasoline a better motor fuel.

Look for the Ethyl emblem. Let Ethyl start to work for you today. Ethyl Gasoline Corporation, New York City.

Wherever you drive—whatever the oil company's name or brand associated with it—any pump bearing the Ethyl emblem represents quality gasoline of anti-knock rating sufficiently high to "knock out that knock" in motors of ordinary compression and to develop the additional power of the new high-compression motors.

The above statement was used in first fluid in national ad.

**ETHYL
GASOLINE**

3 E. C. 139

A FRIEND in Somerset county, Pa., writes the following: "I have a little farm of 30 acres on which I raise truck and berries during the summer months, and teach school during the school term. I am also interested in poultry, and am starting out on a small scale. Last spring I bought 200 chicks and tried to raise them without a brooder. The result was that I got only 100 raised. Out of that bunch I selected 39 pullets, which averaged 31 eggs per day during the month of December, and for the month of January they have averaged 33 eggs per day so far. I feed them greens, meat scraps, green bone, egg mash and a mixed ration of grains."

"I want to tractorize my farm and would like to have your advice on what kind of tractor to use for cultivating purposes. I bought an old one and sent for parts to fix it up to do my plowing and other heavy work. It weighs about 1,400 pounds and cost me around \$225. It does the work of two horses, but is not suited for cultivating."—G. H. B.

I have omitted the pleasant things Mr. G. H. B. says, but am appreciative. The poultry business has for several years been a fairly good and safe business, especially if one has good stock and feeds intelligently. G. H. B.'s foundation stock is evidently good. He has better results from his home mixing of feeds than most beginners have. The average person will do better to buy a good, standard commercial feed than he will to mix it himself.

I am not interested in the selling or promotion of any commercial feed, but our own experience is that it is cheaper and more profitable in every way to depend on a mixed formula that has the backing of scientific experimentation.

I shall mail the inquirer the name of the tractor we use, but it is understood that I do not claim it is the only satisfactory kind made. But it does what is claimed for it and we have used it two seasons with full satisfaction. I have been experimenting for five or six years along this line and have tried different makes, some of them proving worthless for our use.

The use of power on the farm and in the home is being urged from every quarter now, some kind of power that is cheaper than that derived from human and animal muscles. We are told that mechanical and electrical power is necessary to conserve life and relieve the drudgery in making a living. But it must be efficient and be used intelligently. All such power costs actual cash and must be utilized in such a manner as to return a profit; at least, the time and energy saved by its use must be used to advantage, or we will not have incomes sufficient to carry the cost.

The urge to be up to date may be carried too far. Farmers must always weigh the cost of a thing against the advantage. If it is necessary to keep a team on a small farm for work that cannot be done by other power, the expense of a tractor may not be justified. But if a tractor will displace horse power it is another matter.

When we started Neshaminy Gardens, a development that was to be conducted in connection with editorial work, I started the discussion of farming without horses. I had a few letters from horse lovers that didn't read pleasantly. Now, there is a good bit of sentiment in my nature, and I have some love for horses, but neither one is strong enough to induce me to

squander time and money in keeping a horse 12 months for six months work.

But Twentieth Century farmers must not forget that the whole system of life on the farm has changed from that existing a generation and more ago. In the days of our fathers the main business on farms was to produce the greatest possible proportion of the needs of life—food, clothing and shelter. Very little money beyond what was needed for taxes, interest, tea, coffee and sugar was expected or needed. That condition has passed.

In these days farming is a business of raising and selling some thing or things in order to get money to buy the thousand and one things enjoyed today, but which our fathers never had or dreamed of. For this reason farming must be conducted on a strictly business basis or go under. But human nature will have to undergo great changes before it can be sentimental over a gasoline engine or an electric motor.

Friendly Talks

By
Edgar L.
Vincent

THERE is a good deal of pleasure in making out an inventory of one's farm belongings at this season of the year. It is a good thing, for it shows us just about where we stand, as far as this world's goods are concerned.

But did you ever think that another inventory is being made of your actions from day to day? No, it is not likely that you ever did, or that you are even aware that such a list is being made.

But that day when the baby was cutting teeth and so restless that mother was all tired out, did you get the little one up straddle of your neck and trot him around the house with his curly hair was dancing out like beams of sunshine and the trouble was all gone out of his heart and mother was rested again and all right?

Or was there a man down the road who had a sore foot right in haying time; and did you help him out with his work when he did not know which way to turn for some one to give him a lift?

Or was there another man with a heart sorer than the neighbor's foot and did you find out what was his trouble and stay by him till the shadows lifted and all was well with him again?

If you have done these things they have all been listed and they are your best inventory, written in the hearts of those who know you and who love you.

But you never will make any account of the little things you have done that way. Soon they will have passed out of your recollection, and you will be like the folks of the long ago who asked: "When saw we Thee hungered and fed Thee; or thirsted and gave Thee drink? When saw we Thee a stranger and took Thee in; or naked and clothed Thee? Or when saw we Thee sick and in prison and came unto Thee?"

All forgotten! But not by the One Who knows and watches and also records all the good deeds you have done. The record you make of the houses and the lands, the plows and the harrows, the horses and the cows will soon fade out and be forgotten, but the inventory kept by those who love you will last as long as eternity lasts!

Master Farmers for 1929

ON this page are brief biographies of the New Jersey Master Farmers. On pages 8 and 9 will be found similar accounts of the Pennsylvania, Maryland and Delaware Master Farmers.

FRANKLIN G. RUE
Monmouth County, New Jersey

FRANKLIN G. RUE farms because he enjoys farm life. Starting from Denison University on an engineering career, he became ill, returned to the home farm and has been farming ever since. Later he married, built a new home across the road from that of his father and began operating on a share basis that 280-acre Monmouth county farm.

Dairy, grain and potatoes provide the income at "Ashurst," the home of the Rues. The herd of 18 milking cows housed in a new modernly equipped milking barn averaged during the past year 10,500 pounds of milk and 330 pounds of butterfat. Alfalfa and sweet clover are two of the factors leading to high milk production on this farm. Mr. Rue plans to increase the size of his dairy and decrease the acreage of grain grown.

An average of 250 bushels of potatoes per acre for the past five years is evidence of Mr. Rue's ability as a potato grower, and this year during an adverse season for New Jersey growers his 37 acres averaged 210 bushels of first-grade potatoes.

Mr. Rue's advantageous location and his use of the motor truck simplify his marketing problems. Potatoes are sold at the farm. The milk goes by truck to one of the seashore resorts. All of the rye and some of the wheat is sold for seed. Hay and straw not needed on the farm are shipped in carload lots.

The much desired extension of central station power brought electricity to "Ashurst" this fall. The Rues were quick to take full advantage of this in their home. The kitchen with its electric range and refrigerator is a woman's modern workshop. A 15-gallon electric water heater was installed in the house for summer use, while at the barn electric motors furnish power for the water system and the milking outfit.

"No one likes to work for nothing," said Mr. Rue as he told how he was teaching his three boys to work as well as play. They are paid for their labor on the farm and encouraged in school and other activities.

Mr. Rue is president of the Monmouth County Board of Agriculture, a member of the Board of Education and an active member of the New Jersey Farm Bureau Federation.

ALFRED SLOAN

Salem County, New Jersey

ALFRED F. SLOAN, Salem county's Master Farmer, is a man well thought of by his neighbors and associates, a leader in community and county organizations, and a farmer who has adopted modern methods in his management of three farms to meet present-day conditions.

Mr. Sloan started to farm in 1905 on a share basis, with but little capital except his enthusiasm and the assistance of his wife. From this humble start, he later bought the farm where he still resides and since that time has brought under one management three additional farms. The most outstanding feature in Mr. Sloan's success has been his ability to manage over 200 acres of farm land with only slightly more labor than he used in operating one farm. By the use of modern machinery, including tractor operated tools and implements, and a well-balanced system of cropping he has been able to

(Continued on page 7.)

he has taken time from his farming to do something for the potato industry. Mr. Ewart was one of the three guiding hands that helped to bring the potato growers and dealers into line last winter which resulted in the adoption of the Farm Bureau potato grading agreement that meant so much to all central New Jersey growers. The work Mr. Ewart put on this grading agreement and his ability to bring into line some of the opposing factions proves that he has the confidence of his neighbors as well as the farmers and business men of the three counties in the Central Jersey potato belt.

The Ewarts have two children. Grace, 19, is married and lives on an adjoining farm, while Warren, aged 15, resides at home and is still in school.

In the Ewart farm are 132 acres, all of which are tillable. It produces about 70 acres of potatoes each year in addition to corn, wheat, rye and some poultry. The Ewart home is very attractively situated with a large lawn and huge trees stretching down to the road. It is being fitted out with electric lights and many other home conveniences this winter.

CHARLES FITTING

Atlantic County, New Jersey

"ONE of the best farmers in this section," said a farmer neighbor of Charles Fitting, Atlantic county, New Jersey. This was made as no expression of praise, but as a mere statement of fact, and clearly typifies the man and his farming methods.

Quality is the keynote on this 70-acre fruit and truck farm. Nearly every year its products are listed among the prize winners at the horticultural shows. About ten years ago nearly the entire farm was in peaches, but Georgia and other southern grown peaches began to seriously affect the market for the New Jersey crop. Peach growing in the Hammonton district became a losing proposition and Mr. Fitting, like many other growers, found it necessary to change his entire system of farming to produce profitably.

Today the peach acreage is greatly reduced, a part replaced by new varieties bred by the New Jersey Experiment Station. A well-kept apple orchard produces many "fancy" packages of apples. Besides peaches and apples, Mr. Fitting grows asparagus, sweet potatoes and tomatoes.

Not only have the peach growers in this sandy-soiled section been losing their market, but recently the Japanese beetle has added a marketing problem for the large quantity of small fruits grown around Hammonton. Diversification by growing more sweet potatoes in this very adaptable soil might aid his community, thought Mr. Fitting when he started a prize sweet potato growing project through his bank this past year. The results have been very encouraging.

Besides operating his farm and taking an interest in community and state affairs, Mr. Fitting occasionally finds time to travel. Recently Mr. and Mrs. Fitting returned from a visit to Bermuda.

JAMES EWART
Middlesex County, New Jersey

JAMES EWART of Middlesex county, New Jersey, proved his right to the title of Master Farmer five years ago, when in the face of low prices for potatoes and at a time when everybody was crying that there was no money in farming

he bought the farm where he resides today. The fact that Mr. Ewart had confidence in the future of agriculture and backed up his judgment with his savings and his confidence has proved the soundness of his judgment and the firmness of the agriculture of New Jersey.

Mr. Ewart started at scratch in 1907 and for 18 years operated on a share basis. During this time he accumulated a modest sum of money and a wealth of experience in growing potatoes and other crops that are adapted to his section of the state. It was about five years ago, that a well known scientist asked Mr. Ewart why he did not buy a farm. That suggestion spurred him to look around and in so doing he picked out the farm where he resides today. He owns that farm. He has been able to pay for it from his white potato crops in four years and we all know that they have not been the most prosperous ones for our farmers.

Mr. Ewart not only has made the farm pay, but

GOOD WORK RECOGNIZED

READERS who have been interested in the work of Sam Higginbottom at the Allahabad Agricultural Institute will be glad to learn that the trustees of the estate of the late Charles Hall have appropriated \$100,000 for that work. Somebody will always help those who serve faithfully and well.

A MARKET PROBLEM

THE official estimate of the number of cattle on feed in the Corn Belt January first is 99.1 per cent of the number a year earlier. More calves and fewer heavy cattle are in the feed-lots than last winter, and Eastern feeding is considerably less. So far as the prospective supply of beef is concerned the outlook is not bad; but nothing is known of the other side of the problem, the prospective consumption. Can and will the people consume beef so freely as last year?

THE EXTREMES

CROPS failed in a part of China last year. No seeds are planted for coming crops. Stories of famine in which 2,000,000 persons are reported victims of starvation and 2,000,000 more doomed to a like death, with horrible details of misery, bring us abruptly face to face with the trivialities of our misfortunes. How strange to those sufferers must appear a people complaining of the burden of too much food!

SPRING WHEAT ACREAGE

CHAIRMAN LEGGE says that the Federal Farm Board will probably issue a statement to discourage over-planting of spring wheat. Will wheat growers heed the Board's words, or will they count on its action to maintain the price? They may forget its advice and remember that it bid above the market recently for the purpose of keeping the price above its arbitrary loan basis. Growers may likewise remember that the Board was created for the purpose of stabilizing—generally understood as maintaining—prices and may expect it to do so. The area seeded to spring wheat, if weather conditions do not seriously interfere, should indicate whether growers will heed official advice or will be governed by other considerations.

BOTH WRONG

A CONTROVERSY in which both sides are wrong is rather interesting if not quite rare. Such is the argument now going on between the Federal Farm Board and sundry senators about agricultural production. The Board advocates reduction as a means of maintaining prices. The senators advocate in-

creased production, the surpluses to be financed by the Board and exported. The right way is neither of these. It is to leave the matter of production to the collective wisdom of producers, which is greater than the wisdom of a few board members or legislators. No matter how much these may talk, or what they say, the conditions which have influenced production in the past are likely to influence it in the future.

MASTER FARMERS OF 1929

DANIEL BOONE is dead and Davy Crockett reposes in the arms of his ancestors, but the pioneer spirit prevails and even invades our midst. Conditions change; the leather leggings, coonskin cap and trusty flintlock are seen only in museums, while the trappings of the explorer today are more likely to be an airplane, a gas engine or a power spray outfit. The forerunners of a new era are taken as a matter of course, as were the trail blazers of yesterday. We are moved to think of these things when we observe the methods and achievements of the men selected as Master Farmers this year to receive recognition for outstanding merit in their profession. At Trenton last week four New Jersey farmers were presented Master Farmer medals by Pennsylvania Farmer in cooperation with the American Agriculturist. This week at Harrisburg 10 farmers from Pennsylvania and one each from Maryland and Delaware will be honored in like manner. On February fifth three West Virginia farmers will be named and given medals, all these events taking place at the time of the annual farmers' state-wide meetings.

Without exception these Master Farmers are pioneers in some phase of agriculture. They have broken away from the traditions of the past, set their faces toward the future and applied the tools of science with the will for achievement which has characterized the pathfinders of all time. Not alone are these men the pioneers of a new era, since they are but a few of the hundreds nominated by neighbors as worthy of honor. This army is working out the answer to the "agricultural problem"; its members are surveying new territory and by their example are giving us a promise of a better day in farming.

LAST CHANCE!

WHO has not shared the instinct of the migrating birds? When winter comes they spread their wings to leave care and cold behind. While we cannot have their freedom and lack of responsibility, we can in a measure partake of their delight in a change from the rigors of winter. At least such is the plan of several scores of farmers and farm wives who have made reservations for the Florida and Cuba tour which will be conducted by this paper, February 18 to 28. We should be glad to accommodate everybody who would like to take this trip, but since final arrangements for entertainment at many points must be made, and exact number of cars ordered well in advance, we cannot accept requests for space after the last day of this month. "First come, first served"; so if you want to avoid disappointment better mail reservation now, for this is the last chance. See announcement on page 7 for the benefit of those who want to go to Florida only.

A GENERAL STATEMENT

A READER asks us to state "all at once" just what we think about the Federal Farm Board and its policy. That is a big order, too big for a single article, but we may state a few fundamental beliefs with which anybody is at liberty to agree or disagree. It should be understood, first of all, that most of this is not a criticism of the policy of the

Board but a comment on the principles of the law under which it is operating. The Board is not responsible for the law or for anything good or bad in it. Probably most of us would do largely as the Board is trying to do if we were charged, as it is, with the administration of the law. With this preamble let us say:

That we believe in sound cooperation. Likewise we believe that cooperation, like everything else, must ultimately stand on its own feet or fall. We do not believe in subsidizing cooperation with public funds for several reasons, one of them because we foresee a disaster to cooperation when so promoted and subsidized.

We do not believe that cooperation can afford to speculate. We do not believe that any government agency has any moral or legal right to speculate. Yet cooperative agencies are speculating when they extend their operations so that they involve financial risk in members. They are speculating, for instance, when they buy or hold a large volume of grain for the purpose of regulating the price. They are speculating when they advance money on commodities beyond the line of safety. And those who are responsible for such things are speculating, in either case, with property or money which belongs to somebody else.

We do not believe that the Federal Farm Board, or any other public body, should attempt manipulation or control of markets or prices either directly or through any cooperative organization. Yet we have seen in the recent past a conspicuous example of manipulation. And the idea of manipulation or control under the name of "stabilization" or use of "bargaining power" is inherent in the law and in the administration of it. This idea is not so badly stated, but it is there and it is dangerous.

We believe that the quickest and safest corrective of surplus or deficiency in production is the reflection of either in the open market price. Yet the Agricultural Marketing Act provides means to attempt to deprive this corrective of its effect, and the Board must adopt policies with the same intent. If the attempt to abolish the price corrective were temporarily successful surpluses would probably continue and their cumulative effect prove disastrous. All attempts made thus far to regulate production aside from the corrective influence of price penalties or premiums have failed. This one will probably fail too.

We believe that Congress has no moral or constitutional right to appropriate funds to any agency with which to attempt speculation, manipulation or control in the case of any commodity, no matter by what attractive names such movements may be called. And we believe that all such movements, or attempts made as a result of them, will end in damages to agriculture rather than benefits. This, in general terms, is what we believe. Time will tell—it always does.

FROM LIFE

MANY years ago a certain farmer was in trouble. He had bought a good farm without paying much cash, therefore was carrying a heavy mortgage and was without sufficient working capital or credit. He laid his problem before a neighbor, a good farmer and a struggling man to liquidate, pay off his debts and start again as a tenant free from obligations and the worries that go with them. The advice was followed. The farm was sold and other things too, the debts were paid and a new start was made on the very farm he had owned. Without the handicaps of debt and worry the tenant was successful. Years later he bought the farm again, this time to keep. A new start may be better than holding on.

AGRICULTURAL Week

At Trenton opened Tuesday, Jan. 14, with weather dull and foggy, but when Thursday shone clear and cold the increased attendance at the meetings was noticeable. At least 5,000 New Jersey farmers and their wives viewed the exhibits of farm products, the latest farm equipment, and modern household appliances in the Armory during that day. While in general the exhibit was little larger than usual, the potato and corn show was exceptionally good, and some of the new machinery attracted a great deal of attention.

NORMAN FOGG of Salem and Elmer H. Wene of Vineland were elected for four-year terms to the State Board of Agriculture by delegates from state farm organizations, while Willard I. Hamilton of Newark was named to fill the unexpired term of C. Fred Day of Paterson. The re-election of Elmer Wene, who is now president of the State Board, took place on the third ballot after a spirited battle between supporters of Wene and Fred Yahn of Passaic, candidates for four-year terms. Fogg received a majority on the first ballot.

CONTENDING that the Department of Agriculture would become a "political football" if the governor of the state were to appoint a Commissioner of Agriculture to conduct the bureau, the convention voted against a plan urged in the state to substitute the present method of election of the Secretary of Agriculture by the State Board. The delegate asserted that the present method of operation is both efficient and effective.

ARTHUR M. HYDE, Secretary of the United States Department of Agriculture, in his address before the convention in the State House on Wednesday, voiced his opinion on two farm problems which meets the approval of every progressive farmer in the country; his opposition to the continued cultivation of marginal land, and the belief that the time has come when some of the burden of taxation should be shifted from farmers and farm land to others who can more easily carry the load.

"Too rapid expansion of the nation's agricultural industry is responsible for the present unfavorable farm situation," said Secretary Hyde. Farmers were producing more than markets could absorb at profitable prices, and in many instances they glutted their own markets.

Referring to the belief prevalent among some eastern producers that farm relief measures undertaken by the federal government are largely for the benefit of the producing areas of the West and far West, Secretary Hyde explained that the Agricultural Marketing Act proposes "the organization of all farmers of the United States for their mutual benefit."

He failed to say that farmers themselves must first find the need for cooperation and then support that move before it can become sound business and effective.

AID Secretary William B. Duryee, of the State Department of Agriculture, to farmers attending Agricultural Week, "Will the name 'New Jersey' be marked on packages and shipments of farm products signify quality and that quality attained only by adherence along certain lines—or will the name stand for nondescript products that are selling at a discount?"

"Some will say that because of our marketing location we should take advantage of it and market whatever we can grow in the cheapest and most direct manner. It is for us to decide whether we shall market our products as we have largely in the past under such methods, or whether we intend to really face the issue of competition from other states and bring to New Jersey products the public respect that constructive production and marketing methods will secure."

NORMAN WILLIAMS, a 17-year-old Vineland boy, proved to be the champion speller in the state-wide spelling bee sponsored by the New Jersey State Grange. "Supersede" was the downfall of Natalie Haines Pemberton, winner of second honor, after nearly two hours of spelling.

New Jersey Farm Comment

By G. W. HARRIS

Third honor went to Florence Cunningham of Moorestown.

There were 96 contestants, every one a champion of their local Granges, assembled at the Hotel Sterling for luncheon on Thursday as the guests of the State Department of Agriculture. From here they went to the Armory where they battled for spelling honors.

That they were champion spellers was proved at the luncheon when a small tow-haired boy with an extremely serious expression hid behind a pair of large horn-rimmed spectacles tripped up the spelling of John A. Spargo, Assistant Commissioner of Education. (It was Mr. Spargo who conducted the spelling bee.)

"I have never forgotten the word or how to spell the word that spelled me down in a contest one time," Mr. Spargo told the boys and girls.

"That word was 'syzygy,'" he said.

"It is spelled s-y-z-y-g-y."

Frantically, but without avail, a small arm was waved toward Mr. Spargo, but he, evidently not being familiar with schoolroom technique, did not give the boy the floor.

Mr. Spargo's protestor said to me across the table, "He didn't spell that word right. He spelled it —zy, and it should be —gy."

When I went home my dictionary proved that the serious-faced boy was right. Anyway, I maintain that any person, other than a college professor, who can spell syzygy should be called a champion.

WE heartily agree with Theodore F. Gold, president of the Connecticut Holstein-Friesian Association, that every bull is dangerous and that all New Jersey dairymen should have the protection of a fool-proof bull pen.

"Whatever amount a man has to invest in a

herd sire the first portion should be spent in erecting proper facilities for keeping a bull safely. Then the balance can be put into the bull," he said.

THAT the European corn borer will find a congenial home in New Jersey and within three years will be ravaging the corn crop of the state was the prediction of Dr. T. J. Headlee, entomologist at the Experiment Station, to members of the New Jersey Alfalfa Association.

There are more than 175,000 acres devoted to corn in the state which is valued at six and one-half million dollars annually.

MAINTEIN the usual potato acreage in 1930 was advised to potato growers at the meeting of the New Jersey State Potato Association. Since 1925 New Jersey farmers have reduced their acreage in potatoes from 90,000 acres to 50,000 acres, and largely eliminated the marginal land.

The annual value of the crop is placed between \$6,000,000 and \$7,000,000, depending on price fluctuations.

ONE hundred and sixty-two of the 400 members of the New Jersey Dairy Improvement Association were presented with awards of merit on Thursday evening at the largest dairy banquet ever held during Agricultural Week.

These 162 herds, containing 3,749 cows, averaged 300 or more pounds of butterfat during the year. Considered on a state basis the average annual butterfat production for all New Jersey cows is about 230 pounds.

Owners of 32 dairy herds in the state satisfied the state official production test requirements, bringing the total high producing dairy herds to 195 in number.

SOMERSET county, by winning for the third consecutive time, secure permanent possession of the Reading Cup, awarded to the county having the best corn exhibit.

The grand champion award went to William H. Meiers of Cream Ridge. L. G. Wygant of Cream Ridge won the South Jersey sweepstakes, while Smith Brothers of Ringoes captured the North Jersey sweepstakes.

LEMUEL BLACK of Hightstown took sweepstakes prize for the best tub bushel displays of apples in the apple show, while Emmor Roberts of Moorestown was sweepstakes winner in the four-tray exhibit of apples.

JOSEPH JOACHIM of Riverton, with his exhibit of Leghorn baby chicks, won the sweepstakes cup given by the New Jersey Record of Performance Association.

SALEM county won the cup awarded by Governor Larson for the best county exhibit of late-crop Cobblers in the potato show.

MASTER FARMERS FOR 1929

(Continued from page 5.)

operate the 200 odd acres with but one man more than was required 20 years ago on a fifty-acre farm.

With early potatoes, wheat, corn, seed potatoes and poultry he has been able to develop a highly profitable type of farming. At the present time he has about 2,000 bushels of seed potatoes in storage for planting next season.

Mr. and Mrs. Sloan have two sons. Both are greatly interested in farming and take a great deal of pride in helping with the work.

For many years, the Sloan farm has been called the South Jersey white potato experiment station, for on this place Dr. William Martin has placed his largest potato test plots. They have played an important part in the development of the early and second crop potato industries of the state.

In his community, Mr. Sloan is president of the Elmer Exchange Club, a member of the church, the Grange and other organizations. He is a member of the executive committee of the Salem County Board of Agriculture, vice-president of the State Potato Association and a "Big Spud" in 1927 and 1928. The Sloan home has hot water heat and has every convenience for saving work.

Important Announcement

RECENTLY several readers have asked: "Can we go on the Pennsylvania Farmer Southern Tour but stay two extra days in Miami while the rest of the party is making the ocean trip to Cuba?"

Arrangements now have been completed so we may answer, "Yes, those who wish may stay in Miami instead of going to Cuba with the rest of the party."

This makes no change in other plans for the tour. All will travel on the same train and make the same automobile side trips in Florida. All will return north together. At Miami the party will be divided into what we shall call the Florida Section and the Florida-Cuba Section. Those in the Florida-Cuba Section will take a Clyde Line steamship and sail from Miami to Cuba on the evening of February 24, arriving back in Miami on the morning of February 27. Meanwhile those in the Florida Section will spend two extra days of interesting sightseeing in and around Miami. They will live in the Pullman cars which will be parked at a convenient location, so there will be no extra expense for hotel rooms.

Thus the costs and rules applying to the members of the two sections will be as follows:

FLORIDA-CUBA SECTION, complete tour as described in previous issues. Reservations and final payments must be made before February first. Total cost from Harrisburg or Philadelphia to Florida and Cuba and return (excepting only meals for two days in Havana) \$184.50

FLORIDA SECTION, complete tour as described in previous issues, but without trip to Cuba. Reservations and final payments must be made before February eighth. Total cost from Harrisburg or Philadelphia to Miami and return (excepting only meals for two days in Miami) \$142.50

Please Note

All reservations for the Section that goes to Cuba must be received before February first. Members of the Florida Section cannot shift to the Cuba Section after that date.

Other stopovers cannot be arranged at any point in Florida. There will be no hotel expense for those who remain at Miami as they may sleep in the Pullman cars.

The price of \$142.50 for those of the Florida Section covers every necessary expense except meals for two days in Miami, Florida.

The price of \$184.50 for those who make the entire trip as heretofore advertised, including Cuba, covers every necessary expense except meals for two days in Havana, Cuba.

There are enough interesting things around the great city of Miami to keep everybody busy with interesting sightseeing during the two extra days if they decide to forego the short ocean voyage and visit to a foreign country which will be enjoyed by those of the Florida-Cuba Section.

More than enough reservations have been received to assure the success of the Florida-Cuba Section. However, there are still a few spaces available and we shall make every effort to accommodate all who make their reservations and final payments before February 1st.

All reservations are accepted on the understanding that checks will be returned if they arrive after all available accommodations are taken. The tour starts at Philadelphia and Harrisburg on the morning of February 15th. Those who wish may join at Washington, D. C., and will receive a rebate equal to the regular railroad fare north of Washington. Please use the coupon on page 26 for making reservations.

Master Farmers of 1929

GEORGE M. ANTHONY
Berks County, Pa.

GEORGE M. ANTHONY, Berks county's Master Farmer, made his start on the old home farm as the junior member of an unusual father-and-son partnership. The partnership was formed when George returned from the Pennsylvania State College where he had taken a two-year agricultural course. Up to that time the major interest on this old Berks county farm had been a feed mill which was operated in conjunction with the usual farm work. After the return of his son the older Mr. Anthony devoted himself entirely to the mill. The junior partner was given free rein on the farm. His efforts have been so fruitful that he has been able to buy the farm of his father besides acquiring additional acreage needed to carry out his diversified program.

Four large two-story poultry houses and numerous colony houses give the Anthony place the appearance of a highly specialized poultry plant. However, the success of any year's work doesn't depend entirely on chickens. Some fifty acres of potatoes are grown from certified seed; many heads of steers are fattened each winter; a comprehensive program of soil fertility is being followed. Even the poultry business is highly diversified. At the beginning Mr. Anthony installed a small incubator for his own use. Soon the neighbors wanted to buy chicks from his breeding flocks. Now the 50,000-egg incubators are kept busy several months of the year supplying chicks for the home flocks and for the purely local trade; no chicks have ever been shipped.

A new two-story concrete block poultry building, 168 feet long, gives Mr. Anthony a large amount of brooder space which he has utilized to build up a business in pullets. Thus he can market his output as eggs, as day-old chicks or as pullets of any age. Local buyers take all of the hundreds of dozens of eggs that leave the farm each week.

Mr. Anthony cooperates with the county agent whenever he can; he is a Sunday school teacher, an elder in the church and an active member of the school board. He and Mrs. Anthony believe the farm should provide some of the luxuries as well as the necessities of life. Following partial list of the electrical appliances in use in their home: electric dish washer, sweeper, waffle iron, egg cooker, heater, iron, beater, washing machine. They find time for frequent short vacation trips. There are two small children in the family.

C. R. BAUERMASTER
Somerset County, Pa.

FROM school master to Master Farmer in fifteen years is the record established by C. R. Baermaster of Somerset county, Pennsylvania, poultry, potato and dairy specialist. Previous to buying his present farm in 1918 Mr. Baermaster was a farm tenant for four years.

Now he owns 180 acres of fertile Somerset county soil which is growing richer and yielding a comfortable income under the exacting tutelage of this auto-crat of the schoolroom. One hundred and forty acres is under cultivation, the remainder in pasture and woodland, including a maple sugar grove.

In a state of good potato growers Mr. Baermaster ranks with the best, having made the 400-Bushel Club five times in six years. He not only plants certified seed but produces it, and in doing so follows to the letter the latest approved practices of spud production.

Twenty-five Holsteins and Milking Shorthorns contribute the largest single item to the farm income. The herd is tested and accredited free from tuberculosis. A pure-bred Holstein bull is used and the best heifer calves from the registered Holstein cows kept to establish an all pure-bred dairy herd. The average production has increased about 800 pounds of milk in the last five years.

Five hundred and thirty pure-bred Barred Rocks show their care and breeding, for they make a flock of exceptionally fine appearance in type, vitality and uniformity. Special matings with pedigreed stock every few years is elevating the already high standard of the poultry branch on this farm, and production of the flock is increasing favorably.

A hundred acres under cultivation brings the operator face to face with a labor problem. The solution in most places where it has been solved lies in the use of machines. This is the method

which Mr. Baermaster employs, carrying it out in practice as well as in theory, for he is equipped with all labor-saving machinery necessary for operating the farm, not forgetting machines to lighten the household tasks.

The Baermasters have five children ranging from one to eighteen years. The two elder girls have finished or are in high school, while the boys, aged two and five, are potential farmers.

HENRY F. GARBER
Lancaster County, Pa.

FERTILE fields, well tilled and neat; a huge barn that seems to symbolize successful husbandry; an old stone house in a beautiful setting of trees and lawn with a carefully tended flower and vegetable garden nearby. So might be described the typical farm of Pennsylvania's famed Lancaster county. And so might be described the farm of Henry F. Garber, one of that county's two representatives among the Master Farmers of 1929.

Though typical of the best in appearance, Cedar Tree Farm is not typical in some other respects. For example, there is a silo and the usual equipment found on a dairy farm; but for several months in the year no cattle are to be seen. The explanation is to be found in Mr. Garber's belief that winter dairying is most profitable under his particular conditions. Each fall he buys a whole herd of bred-to-milk Wisconsin cows which freshen just after they reach their winter quarters. Before spring they have brought in several fat milk checks and proved their worth to other dairymen who are glad to add this good new blood to their own herds. Thus their over winter owner is free in the summer to devote himself to growing record breaking corn and wheat of finest seed quality. Then there is a young orchard that requires attention, a small acreage of potatoes and sweet corn, a flock of White Leghorns that averages close to 200 eggs per hen, and sometimes some pure-bred Poland-Chinas.

In summer a visitor is likely to find Mrs. Garber out in her flower garden. It recently was designated as one of the very finest farm gardens in the state by an authority who knows about such things. As the years pass and better housekeeping appliances are perfected she can spend more and more time in the open.

All three of the Garber children have taken part in the county corn contests, and the two girls have put up their share of ribbon winning canned goods. The type of corn produced on this farm may be judged from a yield of 3,603 pounds of dry shelled corn on a measured half acre. It weighed 72 pounds to the bushel.

GUY L. HAYMAN
Chester County, Pa.

MOST successful farmers, and all Master Farmers, seem to combine sound business sense with a broad streak of idealism and sometimes a touch of the poetic. Guy L. Hayman of Chester county, Pennsylvania, is no exception. This characteristic was clearly revealed when he was questioned about his work at Northbrook Orchards. "If we are producing better than average fruit," he said, "it is because we are forced to it. We find the only sure profit lies in grades well above the average. Incidentally, we get some joy from the feeling, at the end of the season, that the job has been well done—or done to the best of our ability."

Mr. Hayman's orcharding experience dates from 1912 when his father and the latter's business partner decided to develop an orchard. He was given entire charge of the enterprise. As working manager he chose the site and planted the orchards, making a fruit and poultry farm of what had been a dairy farm. In 1925 he bought the partner's half interest, making it strictly a family undertaking. Management and operation remains entirely in his hands, as it has been from the beginning.

The 100 acres of orchards at Northbrook include 65 acres of bearing apples and 20 acres of bearing peaches. Packing house records showing unusually high percentages of top grades bear evidence of the success of Mr. Hayman's efforts to produce extra quality fruit in quantity.

Northbrook statistics extend to costs of production and have been a great aid in developing a

valuable orchard property at relatively low expense. Here is an example of the way these farm records cut costs; the books showed that the farm horses worked only 30 hours in 1928; result—now Mr. Hayman runs a horseless farm. Similar observations showed that proper care of a large flock of hens was leading to neglect of the spraying program; so the chickens were eliminated. Now better equipment and better organization have simplified spraying and the poultry business is being developed again.

Electricity cooks, refrigerates and does many another chore in the attractive home at Northbrook. Mrs. Hayman is a graduate of Vassar and her husband of Cornell. They have one young son.

HARVEY C. KREITZ
Crawford County, Pa.

TWENTY-TWO years ago, Harvey C. Kreitz, a farm boy, having worked five years in a department store, showed his native common sense by getting married and starting to farm. For 18 years he was a tenant, conducting his affairs in such a way that the occupation of farming looked to him worthy of a life work. He therefore bought the old homestead, previously owned by his wife's father. Here for the last nine years Mr. Kreitz has been applying the multitude of modern practices which go with the successful operation of a farm.

The Kreitz farm of 119 acres is located near Cambridge Springs in Crawford county, Pennsylvania. Sixty-two acres are under cultivation; 57 acres in permanent pasture.

The fertility of the soil is maintained by the application of manure, commercial fertilizers and the use of legume crops. About 15 tons of lime is applied annually. A three-year rotation of clover, corn, oats or wheat, and clover is followed. Rye is used as a winter cover crop. And Mr. Kreitz was a pioneer in alfalfa production in this section. The main money crop on this farm is the milk from a herd of 25 Jerseys. This is retailed by Cambridge Springs, which makes a lot of work and also a lot of money. The herd is tested and free from tuberculosis. Half of the females in the milking herd are now pure-bred and of course the bull which heads the herd is a pure-bred.

In his milk route Mr. Kreitz has found a happy solution of his marketing problem. In addition to milk and cream the product of 150 pure-bred White Leghorns goes direct to the consumer from the milk truck. An acre of potatoes and another acre of cabbage are thus retailed every year.

Mr. and Mrs. Kreitz have three children. The oldest girl is now preparing herself to be a physician. Her sister is studying for a teacher, while the five-year-old son is a real boy who gives early evidence of being a Master Farmer himself some day.

GUY A. LEADER
York County, Pa.

THE history of Guy A. Leader of York county, Pennsylvania, is the story of another country school teacher who turned back to the farm and made a name for himself in agriculture. It was his interest in poultry raising that took him away from the schoolroom. His perseverance in that interest has made him a well known figure in the poultry industry of the East.

Mr. Leader started with a small farm in the rolling hills country just south of York and later bought another place adjoining, which brought his holdings up to 57 acres. The development of his present beautiful, well-kept place has been gradual rather than spectacular. Poultry houses had to be built, fields drained, old buildings repaired and painted, equipment installed then discarded to make room for more modern and more efficient equipment.

The quality ideal is carried to the extreme on Leader Farms. Market eggs are strictly graded and bring top New York prices. The poultry houses are widely scattered because Mr. Leader believes the colony system produces the most hatchable eggs and the strongest chicks. All the houses have electric lights, running water and easily cleaned porcelain drinking fountains. Trap-nest records are kept on all breeding stock. These records reveal not only the number of eggs laid by each hen but also the weight of every egg. All male birds are backed by records exceeding 200

eggs per year. The baby chick business now equals that of producing market eggs and Barred Rock broilers. Two all electric incubators are kept busy during a long season, but nearly all of the eggs required come from the home flocks of Leghorns which total more than 4,000 hens.

Mr. and Mrs. Leader have seven attractive children; all of them old enough are attending school. Mr. Leader's work as head of the Pennsylvania Poultry Association is well known.

ANDREW T. AND JOHN C. McDOWELL
Mercer County, Pa.

SIXTEEN years ago Andrew T. and John C. McDowell, city-bred boys, came with their parents to Mercer county, Pennsylvania, where they bought what was at that time considered the poorest farm in its section of the county. It is now as high in fertility and crop production as any farm in the county, a striking development in a little over a dozen years.

In 1925 the father, R. P. McDowell, died. The boys decided to continue farming together as partners, because, as they put it, "We felt that there was just as good opportunity in agriculture as any other field, provided we would apply ourselves, using the best methods as recommended by our Agricultural Extension Association, State College and our farm papers." There is a good program, but the best thing about it is that the boys stuck to it.

The McDowell Brothers have always been especially active in helping put over extension projects, due to the fact that they have always offered to put on pieces of new work that extension specialists were recommending. They bought the first real potato spraying outfit in the county and have run spraying demonstrations every year for the last eleven years. They have also carried on a number of other demonstrations in connection with hogs, beef cattle and farm crops.

Some of the results of these two young farmers include qualification for the 400-Bushel Potato Club four years in succession, highest yield for potatoes in their county, produced heaviest calf in 1,000-Pound Calf Club in the whole county (wt. 1,127 lbs. at one year of age). They breed and show prize-winning Shorthorn cattle and Poland-China hogs. Potato production is carried out on an extensive scale, 25 acres being grown annually. Certified seed is used and half a ton of 4-8-7 fertilizer applied per acre. The crop is sprayed 14 times, and pays for it by yielding an average of 300 bushels per acre for five years.

CHARLES F. PRESTON
Lancaster County, Pa.

CHARLES F. PRESTON had the benefit of a broad knowledge of Pennsylvania agriculture when he started farming in southern Lancaster county, close to the Chester county line. After completing an agricultural course at the Pennsylvania State College he spent four busy years as county agent in Chester county. A promotion made him assistant state leader of county agents, a position he held two years before he promoted himself, this time back to the old home farm. After working on shares for three years he bought the place from his father in 1922. Potatoes, poultry, milk, mushrooms, seed corn and wheat are the products on which he is building his economic prosperity. His White Leghorn flock has an annual production average of 203 eggs. His program of soil building and spraying has enabled him to qualify for membership in the 400-Bushel Potato Club. Yields of other crops are increasing. A large field too rough for cultivation with modern power machinery is being reforested. It gives Forest Farm its name.

The range of Mr. Preston's activity in local affairs is indicated by a few of the offices he holds or has held recently in organizations working for community betterment: Superintendent of the Oxford Friends' Firstday School, president of the school board, first president of the local Parent-Teachers Association, president of the Guarantors' Association of the Oxford Chautauqua, organizer and past president of Friendly Farmers' Club. He gives his services no less freely to farm organizations, now being vice-president and a director of the Lancaster County Farm Bureau, a director of the Inter-State Milk Producers' Association, of the Little Britain Detective Association and a past director of the Mushroom Growers' Cooperative

Association of Pennsylvania.

Mr. and Mrs. Preston believe that the greatest advantage of rural life is the opportunity it affords for the development of sound bodies and healthy minds in the younger generation. The Preston children, ranging up to high school age, are keen and interested workers on the farm and in junior community affairs. At home each is given certain responsibilities to carry and each receives proper pay for the discharge of certain duties made lighter by modern conveniences. No visitor can doubt the truth of Mr. Preston's assertion that "our home is one of much happiness."

NORMAN E. RISHEL
York County, Pa.

THE world is full of men who have made good in their chosen occupations in town and city after having farmed long enough to learn that the farm wasn't the place for them. The reverse is equally true. We find among the Master Farmers many successful men who spent some years in other lines of work. One of the traits that made these men Master Farmers is the one that prompted them to make a change when they discovered they were in the wrong occupation.

Norman E. Rishel was a school teacher in his old home county of Somerset, Pennsylvania, before he moved with his family to York county. There, following a business college course, he started his brief career in business. Two years in town convinced him that a business of his own out on some York county's beautiful hills was more to be desired than the most successful career in an office. So he settled as a tenant on a farm a few miles north of York, close to the farms of several relatives. A year as a tenant gave him time to locate the place he wanted for himself. In 1920 he took possession. Since then the mortgage has been paid off and the farm has been made one of the most productive and best equipped in the county.

Mr. Rishel has built his enterprise around an exceptionally high producing accredited Holstein herd which he bred from a few good foundation animals. The present annual herd average is 12,500 pounds of milk and 425 pounds of butterfat per cow. Scrupulous cleanliness around the dairy barn enables him to produce milk of very low bacterial count. An electric milk cooling system and ice machine helps maintain the quality. In 1928 this raw milk had the lowest average bacterial count of any entering the city of York.

The children are receiving training in music. Ruth, eleven, won first prize on her cake and cookies at the last State Farm Products Show.

SAMUEL L. SMEDLEY, JR.
Delaware County, Pa.

SAMUEL L. SMEDLEY, Jr., of Delaware county, Pennsylvania, is a specialist in the growing and marketing of apples of finest quality. Practically all the activities on Twin Ash Fruit Farm center around the orcharding business. The production of market lambs is an important side line but the principal reason for sheep raising is to help keep clean the parts of the farm not devoted to orcharding. Mr. Smedley probably has won more prizes on apples at the Pennsylvania State Farm Products Show in recent years than any other individual.

A recent addition to the farm buildings is a model 9,000-bushel storage cellar, the walls of which are surmounted by a modernly equipped fruit packing house. Constant experiments are being conducted at Twin Ash Farm with new tools and new methods of doing things are some of his recent enterprises: Use of heavy subsiding equipment to stop erosion; orchard tests in cooperation with makers of synthetic nitrogen; work in cooperation with state and national agricultural authorities on spraying, problems and the growing of trees grafted on special disease resisting stocks; experiments in girdling fruit trees to bring about early bearing; demonstrations in bridge grafting and in the use of high percentage dynamite in ditch digging.

When Mr. Smedley completed his course in horticulture at the Pennsylvania State College in 1916 he took over the operation of his father's farm on a rental basis. The place had been tenanted before he went to college but with that exception the developments that have made this one of the outstanding fruit farms have been made since Mr. Smedley graduated from Penn State.

Mr. and Mrs. Smedley find time to leave their attractive home for occasional vacation trips and

for participation in various organization enterprises. Mr. Smedley is or recently has been a Sunday school teacher, treasurer of the Delaware County Agricultural Extension Association, president of the Tri-State Farmers' Club and of the Delaware-Chester County Fruit Growers' Association.

JOHN D. REYNOLDS
New Castle County, Delaware

DELAWARE'S Master Farmer for 1929 is a tenant farmer, a share renter. Those terms too often bring up a mental picture of discontented tenants moving every year or two from one rundown farm to another. But no stretch of the imagination can include John D. Reynolds of New Castle County in such a picture. Being an enterprising farmer of the highest type, Mr. Reynolds has been given unusual advantages by his landlord. And it is those advantages that have persuaded him to apply his skill through the years to a farm he does not own.

All but 25 of the 365 acres of this fertile farm are under cultivation. Mr. Reynolds believes in the economy of modern machinery. He has divided the farm into rectangular fields of from 30 to 65 acres each. The farm unites dairying with the large scale production of canner crops. The dairy barn, too, is equipped for efficiency, with a milking machine and a full complement of time savers for the caretakers.

The dairy herd is being built up gradually after a disastrous tuberculosis test several years ago. The 30 cows in the milking herd at present average over 300 pounds of butterfat per year. Considerable poultry is produced as a side line. Thirty acres or more of soy beans are grown as a cover crop, and the farm produces heavy yields of that other favorite legume, alfalfa. Both help enrich the soil for other crops of which the following acreage figures for the last year are typical: 50 acres of sweet corn; 40 of field corn; 75 of wheat; 30 of canning peas; 15 of tomatoes.

Mr. Reynolds has long been one of the outstanding figures in Delaware agriculture. He is president of the Delaware State Farm Bureau and is on the executive committee of the New Castle County Farm Bureau. The one daughter of the Reynolds family, Mary, is a well-known home economics extension specialist of the Pennsylvania State College.

RAY C. NORMAN
Harford County, Maryland

HIDDEN away on a back road in the hills of Harford county, Maryland, is Normandy Farm, a modest appearing place that proves an unfailing inspiration to every one who visits it and talks with its equally modest young owners, Mr. and Mrs. Ray C. Norman. The Normans have been so busy at home during the last few years that they are little known in Maryland outside their community. But the result of their work is famous throughout the United States wherever good stock is known and talked about.

It is not a boast but a simple statement of fact when Mr. Norman says: "If birds from our flocks cannot win in any competition anywhere we get some that can and try to breed better ones." That applies to livestock too. The result of a few years of intensive work on this plan is exactly what one might expect. Animals and birds bred at Normandy Farm are now to be found throughout the whole country east of the Rocky Mountains. In 1929 fifty head of cattle were sold at an average price on all, including calves, of well over \$300. Hundreds of premiums have been won at the most important fairs in the country. The herd of Berkshire swine has won more than \$3000 in prizes on the show circuit in one season.

Mr. Norman returned from the World War as one of the few survivors of a company that spent a year at the hardest part of the Front. Starting without capital he went into debt to buy his farm and start his purebred flocks and herds. Mr. Norman on his letterhead lists only Ayrshire cattle, Berkshire swine, Dorset sheep, Bourbon Red turkeys, Toulouse geese, Muscovy ducks and Jersey Black Giant chickens. But there are several side-lines carried on in the name of Jack, the little son of the family. They include the breeding of Hampshire sheep, Buff Cochins bantams, Hungarian and Carneau pigeons, Ring Neck pheasants and registered bull dogs. Every bird and animal on the place is purebred—except the cat—and nearly every one is of blue ribbon quality.

TOOTS did not look convinced. He dropped the subject, however, and they conversed about his trip and what had happened at Carrbury since his absence. It was on the tip of his tongue more than once to mention the disposal he had made of his two hundred dollars, but the habit of reserve concerning his own affairs, bred by his self-reliant life restrained him.

Nancy had served supper in the ell kitchen and as it happened Toots had never been in that room before. It was not sheathed and plastered like the rest of the house, and the old beams and wood-work made a picturesque, shadowed setting in the lamplight. Toots, always quietly observant, noticed that some of the beams were scored in a peculiar way, but the light was not strong enough to make them decipherable.

"Only some tallies the gunners scratched up in father's time," said Daddy, perceiving his interest. "The old man was a great sportsman. He had spells of takin' in bo'ders—like the Colonel wanted to—but he never made no money by it. Leastwise he never kep' it if he did."

After a little more talk Toots, who was feeling comfortably tired, went to his room with Hector, and in fifteen minutes both of them were sound asleep under the rose-covered roof.

Both the storekeeper Tigert and his new assistant worked hard the following day, lunching as before on some odds and ends of the grocery stock, and by late afternoon, in spite of various interruptions, the store was in pretty good order. The change pleased Tigert, and he was quite taken as well with the way Toots waited on his customers. He actually loosened up to such an extent that he offered his assistant a stogie.

"Don't smoke, eh?" he asked when Toots declined the article. "Well, I don't think any less of you for that." He drew a pipe from his pocket and added: "Neither do I, while doin' business. I fell from a ladder once an' like to of killed myself. I never did get my full wits back for a month, an' then I found my wife had gone to takin' bo'ders. You can't blame her either. Somethin' had to be done while I was lyin' on my back starin' at the fly-specks on the ceiling, but the worst of it was she'd got in a night-watchman an' owin' to his peccoliar hours an' my bein' an invalid an' risin' late we was always together at breakfast."

"Well, sir, that night-watchman stunk so of terbaccer I couldn't eat a mite. Not a mite. He was plumb freighted with the smell of it. I says to myself then an' thar, 'If terbaccer's that disagreeable to me, what must it be to them who don't smoke?' I swore I'd never smoke again while I was waitin' on folks an' I never have."

TOOTS decided that he was always running into people who were a little odd. Tigert was certainly that though his oddity did not noticeably interfere with his business. He was a very persuasive salesman and he had need to be, for his prices were always high and he had been accused more than once of profiteering. Nothing that fell into his hands was ever thrown away. Spoiled or damaged goods he sold to the negroes, or ate himself; broken crates and excelsior he disposed of as kindling, and he drove sharp bargains at regular intervals with the junkman over empty bottles and such odds and ends.

Trade at the store was as brisk as business ever would be in Carrbury. In the first place there was a certain amount of curiosity over the new assistant, who came from "goodness knows where, my dear!" His former association with Colonel Jesse lent him an added interest, for no one had ever disputed the Colonel's right to be considered the principal citizen of the town. In the second place the sudden spic-and-span appearance of the store was a novelty worth inspecting. Whether it would last or not, considering Tigert's well-known lack of method, was a question always worth discussion. A good many of the young ladies developed an unusual readiness to fetch grocery supplies for their mammas. That they found Toots reserved did not seem to lessen their interest. Perhaps the fact that they thought him handsome had something to do with it.

At irregular intervals fishermen and oystertongers from the "fleet" dropped into Carrbury to stock up with provisions and stretch their legs in a shore spree. The great majority were men from farther up or down the coast, sea nomads more or less, whose home was on the water for at least eight months of the year, a rough, tough, lawless lot in the main, always ready for a fight or a carousal if the opportunity offered. Though the eighteenth amendment was supposed to be in full force in Carrbury it was an open secret that the "fleet" bought "hooch" from some source. They were canny enough not to drink it while ashore, or much of it, but once aboard their boats they lost no time in getting uproariously intoxicated, to

A Thinking Job

By Fisher Ames

Copyright, 1929, by Copper-Harman-Stocum Company

Synopsis

Toots Pouche, an orphan boy with no job, spends his last dollar to rescue a dog from a fight with a captive wildcat. The boy secures employment at the Broad View Hotel, a likely place run by a southern gentleman apparently more for love than for money, since it is evidently not a paying proposition. The Colonel dies suddenly after arranging for Toots to have his library. The boy and his dog are now part of the crew on Jack Rose's craft the Stingaree.

As guests of an explorer on an ancient craft, Toots and Rose are shipwrecked but manage to get back to the Stingaree. Toots has just learned that the boat is in her home port and he must look for another job.

the indignation of the decent element of the town.

Toots had no use for the drinking set, but there was something in the robust, two-fisted life of these tide-water workers that had its fascination for him. It was not only romantic and vigorous, there was money to be made at it, if rumor could be believed, and Toots wanted to save enough to buy that education which had been so nearly within his reach on the day of Colonel Jesse's death.

Tigert always waited on the "fleet" crowd himself, notifying Toots in so many words that this was his express desire. Their trade differed from that of the townspeople and Tigert catered to it, keeping a large stock of special commodities for their benefit. Most of this stock Tigert kept stored in a rear room and carried the key to the place in his pocket. He knew what the men wanted and

The Cheerful Plowman

YOU CAN'T CHANGE NATURE

H, I used to cuss the rooster for his crowing in the morn. "It's all right to be a booter," I proclaimed with cutting scorn, "but this tom-foot early crowing when a fellow's in his bed is the bunk, that's easy showing! That old rooster should be dead!"

Oh, I used to scold the porkers for their squealing for their feed; and "Their voices sure are corks, all sopranos gone to seed!" I would groan whenever that chorus sent its music through the air, every pig from Dan to Doris, every porker, dark or fair.

Oh, I used to jaw the guineas for their shrieking and their noise. "They are just a bunch of ninnies, without wisdom, grace, or poise!" I declared in tones emphatic as I called to them to quit, "Yes, I'll lock them in the attic if they throw another fit!"

Oh, I used to rave at ganders for their hisses and their cries, for they roused my dormant danders, put the blood-lust in my eyes. "They could well conserve their hooting!" I opined with earnest zeal, and I talked to them of shooting and of making me a meal.

Oh, I used to speak with vigor to the mule we knew as Dan, for it took the rigid rigor of a special type of man to make him pull a binder, or a hay-rake or a cart, though he was a stem-twist-winder when he did consent to start!

But, I was wasting wishes when I wished for them to change, might just as well place fishes on a western cattle range and expect them there to fatten on the bunch-grass and the sage, or expect the moon to flatten, or a girl to tell her age.

Take nature as you find it! That's the way I'm doing now, and the racket, I don't mind it in the gander and the cow; and the crowing, and the barking, and the shrieking and the hoots, these no longer start me talking, you can bet your leather boots! J. E. T.

what they would accept if a substitute was necessary, and as they were a difficult lot in general his skill in handling of them made the arrangement seem a perfectly natural one.

Tigert happened to be out one day on an errand when a couple of enter-tongers dropped in. They were obviously disappointed at the proprietor's absence and lounged about a time, surreptitiously eyeing Toots but boorishly declining the offer of his services. Growing impatient finally one of them ordered a few stock-canned goods and a ten-pound bag of flour. He objected instantly, however, when Toots lifted the cover of the flour barrel.

"Not that kind, young feller," he said. "Gimme the Red Mill brand."

"Sorry, but that's in the stock-room, and Capt. Tigert's got the key," said Toots. "I reckon there's not much difference anyway. This is good flour and the price of all brands is about the same."

"You ain't paid to spread your opinions none, retorted the tonger. "Yere I come nine mile fer a bag o' Red Mill an' git put off with another brand. What d'you think o' that, Hoke?"

His friend grumbled disgustedly through a ragged mustache and rolled a pair of inflamed eyes around angrily. "Is this yere Capt'n Tigert runnin' er store, or fer Congress?" he inquired of nobody in particular. "Nine o' the driest miles I was wet I ever come. Say, sonny, you put it inter the Capt'n's ear then, when we-all come fer Red Mill flour we want it."

The two tongers departed in this hostile frame of mind. It seemed a good deal of a fuss to make over a brand of flour, but Toots soon forgot the matter in attending to the wants of other customers, of whom Mrs. Ham was one. He had never met her before, but she pleasantly introduced herself with a smiling allusion to their friendship with Jack Rose. Toots instantly decided that he should like her. She was alert and sensible-looking, and rather pretty, with that natural charm of manner that comes from a straight-forward, sympathetic nature.

"You know," she said, "I've always longed to keep store. It seems such a cosy kind of business."

"Nesta!" exclaimed her sister in a shocked voice. "Well, why not? I'm not a person of leisure and goodness knows I have to do things much—"

"If you wish to joke please do so with persons who won't misunderstand you," said Miss Orianda, her fat face reddening.

"I'm sure Mr. Pouche doesn't misunderstand," replied Mrs. Ham smiling. "If another assistant is ever needed I hope he'll remember me, I really have a knack for figures."

"I wish you had a knack for proper pride," retorted Miss Orianda, as she sailed haughtily out.

It was the confinement that Toots, used to a very active life outdoors, found the most irksome feature of his work, but he had sense enough not to let that count against it. College students, professional men, the men who had the world's best jobs were, he knew, indoor workers generally speaking. It was the ditch-hands, road-thumpers and day laborers only who could count on eight hours in the open air—and on little else. Toots missed that matter as one of no real importance. The trouble was that after he had got things started and going with a swing they kept on going smoothly, more or less of their own momentum, while he settled down into the role of a mere automaton.

There was some alleviation in studying his customers. Tigert had said: "A man who keeps gets to know human nature right well," and Toots was not long in discovering the truth of this. He learned to distinguish between the people who were niggardly and those who were really hard up, he saw all sorts of little vanities and affectations; and suspicious and generous natures revealed in the light of his work, but he got side-lights into a good many domestic situations, humorous, tragic, or happy.

This habit of observation led him to note the most of the "fleet" crowd were quite as particular to get Red Mill flour as Hoke and his friend had been. He was never allowed to fetch this himself. The stock-room was Tigert's particular province and every sealed bag of Red Mill that came out of it he fetched with his own hands. Tigert kept the books also, but occasionally when a customer disputed some charge item Toots was allowed to consult the entries.

On one such occasion he noticed that every bag of Red Mill entered as sold was marked with a small cross in lead pencil. The fact would not have struck him as peculiar but for the presence of a loose sheet of paper bearing a number of similar crosses, opposite each of which stood a figure. The next time he had to use the books the loose sheet was gone.

(To be continued.)

Old Pewter Useful

By ELLEN S. BRINTON

If you have any old pewter pieces in your cupboards or attic get them down and enjoy them. Pewter is now as popular as silver and new pewter candlesticks, platters and pitchers are on sale in all city stores. New pewter costs about the same as good plated silverware and does not grow shabby with age. Pewter does not break like china, and it does not wear out with ordinary handling. The chief precaution is not to let pewter get too near the fire for it will melt like lead under extreme heat.

Old pewter can be readily brightened by boiling fifteen minutes or longer in a solution of one-half cup of washing soda to a gallon of water. This is the only method by which old tea and coffee pots can be made fit for use again. For final polishing rub with any fine cleaning paste or silver cleaning preparations. Sometimes old pewter becomes badly corroded and then I have found aid in a bit of fine steel wool—rubbing very carefully till the surface is smooth.

Pewter plates may be used under a bowl of flowers on the dining table, under the water pitcher for a cake plate. Be careful about knife marks on the metal is soft and scratches easily. The large pewter serving plates make an excellent foundation for the holiday turkey or they can be used as a tray. Very occasionally we use the big pewter coffee and tea pots for their intended purposes. The various tea set pieces are used for ornament as shown in the accompanying picture.

On the left the sugar bowl is filled with spring flowers—white spirea, pink tulips and dwarf blue aloes.

The stemmed pewter bowl on the right is used to hold a pot of helexine. As this will flourish standing in water and without any direct sunlight it makes an ideal plant for the dining room table. Helexine is a leafy plant often found growing in ornamental green houses. A piece will root readily in damp soil if covered with glass for a week. Very soon the whole pot is a mass of luxuriant green, then trailing down until it spreads on the table. It must have plenty of water. When the top begins to look faded and stale transfer to a larger pot, or else start a new pot with a piece of the old plant. Helexine looks particularly well in a holder of pewter.

The First Rule

MARKET gardeners need no reminder of the value of early prevention and constant preventive work in the growing of vegetables. We have the corn borer added to our other insect pests, the first rule being a thorough cleaning of garden beds must be even more faithfully followed. Every weed, every stalk of corn or stem of plant must be reduced to ashes at the earliest possible date, not in any huge bonfire but with the caution learned from the old maxim: "Better be safe than sorry."

Perhaps many of us do not remember this old saying, heard in an early more often than now. But if industry, protected against every range of weather, must still guard against all possible risks of loss how every disaster of wind and skies, forever on guard. So the shut-in days of January should find us studying seed catalogs and fair days find cleaning the ground of all remains of last year's growth, and safeguarding fences and gates against intruders that threaten the most precious acre of the farm; the source of our supply of fresh vegetables.

Of equal importance is the selection of seeds from old friends among dealers whose seeds we have tested and found true to type. Saving our own seeds is of doubtful economy because few of them have space to keep maturing seeds free from danger of mixing with others of like kind. Especially such plants as tomatoes and Golden Bantam sweet corn, easily the finest sweet corn in the world today. Only as these can be grown at some

The Farm Home

Harriet Hurries

By BETTY BARCLAY

"HURRY up Harriet!" exclaimed Mrs. Purdy. "Jane and Fanny just phoned that they will be here for lunch. Only ten minutes to prepare for them. Harriet merely laughed.

"A ten-minute salad, a cup of tea, some bread and marmalade. . . . it isn't so hard. Why are you so flustered, mother?"

"You don't know Fanny Pyle as I do," remarked Mrs. Purdy grimly. "She watches everything like a hawk, and if things aren't just right, well you hear about them later. Let's hurry."

When the company arrived a few minutes later, Mrs. Purdy greeted them at the door, while Harriet put the last touches on the table.

"We are just sitting down to lunch now, folks," said Mrs. Purdy. "I told Harriet you were coming over, as soon as you telephoned, and she prepared for you too. Let's start our visit over the teacups."

Fanny Pyle's eyes glanced over that table and finding nothing with which she could pick fault turned to Harriet with a smile.

"It's a wonderful little lunch," Harriet flushed, and said, "It's only a simple omelette like mother and I always eat. We call it our balancing meal, you know."

"Yes? I hardly know whether I understand you or not."

Harriet laughed again.

"We eat a good bit of meat and bread in this house," she admitted. "So at lunch, mother and I balance those acid-producers by eating a lot of green vegetables and fresh fruit. Today you are helping us as you nibble on this ten-minute salad."

"It's delicious," admitted Fanny. "Celery and orange, isn't it?"

"And apple," said Harriet. "The apple and celery are cut into such fine bits that it is hard to find the apple sometimes. However, both the celery and the apple are among our favorite alkaline foods, so we use them with the oranges."

"I should say the orange was an acid producer," remarked Fanny.

"By no means," corrected Harriet. "Although many think of the orange as an acid fruit, it really has an alkaline effect when taken into the stomach. In fact it is very strongly alkaline."

Later in the day as the callers left each carried in her handbag a handwritten recipe for the little ten-minute salad that Harriet had gotten together in such a hurry.

You may be interested in trying the same recipe, so here it is:

Ten-Minute Salad

Peel oranges and remove all white skin. Cut into one-fourth inch slices and cut each slice into halves. Dice celery and apple and mix with mayonnaise. Arrange a circle of half-slices of oranges on a lettuce-covered salad plate, fill center with apple and celery mixture and garnish with celery tips.

One-Dish Meal

ECONOMY, efficiency and convenience are all characteristics of the one-dish meal just as they are of the one-piece dress, says Miss Lella C. Ogle, extension specialist in nutrition on the staff of the Ohio State University.

An appetizing and adequate dinner may consist only of a meat and vegetable stew, bread and butter, milk, and a baked custard or fruit dessert. Into the stew go meat, potatoes, carrots, onions and possibly celery.

Another one-dish meal may be based on vegetable soup containing meat, cabbage, carrots, onions, tomatoes and corn. Pot-roast with meat, potatoes, carrots, turnips and whole onions, is another possibility.

A dinner a little more elaborate may consist of meat, potatoes or rice, a green salad, bread and butter, and a dessert, which may be simply fruit and milk.

New uses for old pewterware which can be cleaned by boiling in a washing soda solution.

distance from any other varieties can the seed be kept pure.

The National Canning Contest of last year will in all probability be repeated this coming year and we are glad to promise our readers the detailed method of one who has been canning all kinds of vegetables successfully for years. This will appear in an early issue.

Hepsy Neff.

That Welcoming Word

HAVE you ever stopped to think how much you like to go to some homes, and how you put off going to others? Why is it? Let us stop and think. I enjoy stopping in at Marcia's for a while on Saturday morning, or dropping in to spend an evening. All the girls like to go to Marcia's. In fact it is the most popular of all my friends' homes.

She is glad to see us and she shows it. There is always a note of glad surprise in her voice when she greets me at the door. It is as if she felt I were paying her a delightful compliment to come. She opens the door wide, gives my hand a strong pressure, smiles into my eyes, ushers me in, takes my wraps, and sees me comfortably seated.

Now that I realize how Marcia's charming hospitality begins with her welcoming word, I see how that hearty welcome might well be practiced by any girl who wishes to learn the art of being a perfect hostess. For no matter how kindly you

Country women can be very good neighbors to each other during the busy sewing month of January. The men help fill slots and plant tomatoes—why not the women help each other fit the dresses better?

treat a guest after she is in your home, the effect of true hospitality will be lost without that eager first smile in the eyes of the hostess, that welcoming handshake, that hearty greeting.

Marion Cossitt Brackin.

A light lunch after school of milk, bread and butter, or fresh fruit is desirable for hungry boys and girls.

To remove stains on mattresses cover them with a thick paste of laundry starch and soap jelly, allow it to remain until dry and then brush it off with a whisk broom.

Nothing More Suitable

No. 126.—Smart Jacket Costume. The smart woman today just can't get along without several jacket costumes. The one illustrated is probably one of the most popular outfits of the season because of its youthfulness and slenderness. It is in flattering yellow-beige and brown wool jersey in knitted weave. The long-waisted bodice of dress just pretends a nippoke belted at raised waistline. The becoming neckline is completed with jaunty bow tie of brown grosgrain ribbon. The jacket is lined with the plain crepe de chine that matches the plain jersey that is used for the collar and rever facing.

Style No. 126 is designed in sizes 16, 18, 20 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 3 1/2 yards of 39-inch material for jacket and skirt with 4 yards of 39-inch material for blouse and jacket lining.

No. 111.—This style is especially suitable for the larger woman. The belt rests at normal waistline. Hips are extremely snug, with slightly flared fullness at hem, with skirt given a wrapped movement through curved seaming at side-front. It is designed in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 4 1/2 yards of 39-inch material with 1/2 yard of 17-inch contrasting and 2 yards of 1-inch ribbon. It is ultra-modish in black suede broadcloth with vestee in eggshell shade of dull blue of crepe satin with bows of the shiny shade. Knitted wool jersey weaves in dark dahlia-purple tones is effective. Black green wool crepe, black canton crepe, midnight blue flat silk crepe and jacquard silk crepe in dark narrow red tones are chic combinations.

No. 121.—Designed in sizes 16, 18, 20 years, 36, 38, 40 and 42 inches bust measure. Size 36 requires 4 1/2 yards of 39-inch material. It's a dress that you can wear all winter long. Black suede broadcloth with vestee of eggshell silk crepe is decidedly chic for street, and general daytime occasions. Feather weight tweed is

well-liked in Spanish red tones. Black canton crepe, dahlia-purple faille silk crepe, plum-shade in canton crepe, rust brown jacquard silk crepe and midnight blue wool crepe are effective combinations.

No. 112.—One-Piece Coat Type. A charming one-piece coat type that rather reflects the ensemble idea in its clever styling, with a separate underdress having straight upper edge. It combines a featherweight tweed in yellow-beige and brown tones with plain brown woolen, and places its belt at raised waistline. Buttons down center-front, hold the garment closely to the figure through waist and hips, with lower part left free to reveal the underdress.

Style No. 112 offers a definite change in straight lines which add to the effect of slenderness. It is designed in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. For the woman of average figure, 2 1/2 yards of 39-inch plain material with 1 1/2 yards of 39-inch contrasting, is sufficient.

No. 108.—Slender Type. Pin inverted tucks narrow the shoulders of collarless neckline. The skirt flares gracefully at sides and at the back. Style No. 108 is a jacquard silk crepe in dark dahlia tones, uses plain crepe in blending tone for rever facing, cuffs and bow at end of V-opening. Bern lace vestee adds chic touch of femininity. It is designed in sizes 36, 38, 40, 42, 44 and 46 inches bust measure. Size 36 requires 3 1/2 yards of 39-inch material with 1/2 yard of 27-inch lace and 1/2 yard of 27-inch contrasting. Black crepe satin is very attractive and wearable with the rever facing, bow, cuff bands and vestee cut from the dull surface. Crepe de chine, suede broadcloth, faille silk crepe, crepe marocain, and sheer velvet are appropriate.

No. 137.—A black lustrous crepe satin with a new smartness all its own. The round neckline is finished with an applied band that extends down left side-front and cuts all in one with front skirt hip, smoothly emphasized by using the dull side

Poultry Problems

World's Poultry Congress

THE governments of 45 countries, including the United States, have accepted the invitation of the British government to participate in the fourth International Exposition of the World's Poultry Congress in London, July 22 to 30, 1930. The Congress is held under the auspices of the World's Poultry Science Association in the Crystal Palace, one of the most noted exhibition buildings in the world.

The United States will be represented by government officials and others designated by the association, and by a national educational exhibit now being prepared by the U. S. Department of Agriculture. The exhibit, for which Congress made available an appropriation of \$25,000 at its last session, will portray the fundamental features of the nation's billion dollar poultry industry, covering the various phases of production marketing, and the consumption of poultry products.

Dr. M. A. Jull, senior poultry husbandman of the U. S. Department of Agriculture, and general chairman of the World's Poultry Congress for the United States, reports that arrangements have been made for an official boat to carry all Canadian and United States delegates. The boat will leave Montreal July 12, and it is expected that several hundred poultrymen from the United States will be aboard. A post-congress tour of England, Scotland and Ireland has been organized by the British government and the World's Poultry Science Association for the visiting delegates.

Further information regarding the Congress or the tour may be obtained by writing Doctor Jull, or H. R. Lewis, president of the National Poultry Council, East Greenwich, Rhode Island.

Houses for Turkeys

Am interested in trying to raise turkeys this spring. Will you tell me something about the houses required by the young poults? G. H. G.

A BROODER house which is satisfactory for the raising of baby chicks will be satisfactory for raising poults. After the poults have reached the age of three or four months they may then be transferred to a permanent building.

This building should be double-boarded on both ends and back, while the front may be entirely open. It is well to construct this building at least 24 feet deep. Turkeys desire to roost high in the air. If droppings boards are used they may be placed in the rear of the house, preferably four feet off the floor. The roosts, of course, can be placed above the droppings boards.

It is imperative, if the poults are given free range, that the brooder house be moved every week or two to fresh ground. Another satisfactory method, however, is to place the house in the center of a four-acre field and give the turkeys four yards each consisting of one acre. The poults are placed in Yard No. 1 for one week and then transferred to Yard No. 2 the second week; during which time Yard No. 1 may be plowed, harrowed, limed and sowed to a green crop. After the turkeys reach Yard No. 4, Yard No. 1 is available for them the following week. H. C. K.

Feeding Ducklings

Will you please give me some advice on the care and feeding of little ducks? Also, when do you pick ducks? Mrs. H. G. McAfee.

THE following recommendation is made by the Missouri State Experiment Station at Mountain Grove, Missouri, relative to the feeding of young ducklings:

There are several good methods of

feeding ducklings. Do not feed until they are at least 36 hours old. For the next three days, feed five times daily. Use a mixture of equal parts by measure of rolled oats and bread crumbs, with three per cent of sharp sand, moistened with water or fed dry.

After three days, this feed is changed to equal parts bread, rolled oats, bran and corn meal with three per cent sand.

After the first week, the feed consists of three parts bran, one part each of low grade flour and corn meal, ten per cent of green feed and five per cent meat scraps with the same percentage of sand. Feed four times daily from the end of the first week until the ducklings are three weeks old and three times daily thereafter. The meat scraps should be increased gradually after the second week until it is about ten per cent when the ducklings are one month old.

As a general rule, the removal of feathers from live ducks is not practiced to any considerable extent. In the case of geese, the feathers are often removed every six weeks during the spring, summer and early fall months. Some people, however, remove the feathers only once in the spring and once in the fall. Geese should, of course, never be plucked during the later fall and winter or during the breeding season. H. C. K.

Bloody Eggs

What is the cause of eggs being bloody? I don't mean just blood spots but entire eggs being so, and is there any remedy for same? C. K. E.

BLOOD clots and bloody eggs are most common in the spring months during the period of heavy production. They are caused by the rupture of a blood vessel in the ovary of the hen. The rupture may be the result of abnormal circumstances as the splitting of the yolk sac in some other part than the suture line or the rupture of a blood vessel extending across this suture line. The blood thus released may remain on the surface of the yolk or appear as a streak or distinct clot. Then, too, it may diffuse through the albumen; in which case the egg is termed bloody.

The albumen of a bloody egg is not used for food but the yolk may be used if desired.

Some people believe that by reducing the amount of animal protein products in the ration, thus causing egg production to decrease, a fewer number of blood spots and bloody eggs are produced.

Goslings Have Fits

Can you please tell me what was the matter with my geese last season? They were all right until they were three weeks old. Then they seemed to get fits. They would throw their heads over their backs and seem to be in pain and died in a few minutes. They were on range. I fed only rolled oats. I want to avoid the trouble this year. E. S.

GOSLINGS as a rule are remarkably free from disease. One of the principal troubles in goslings is diarrhea. This is usually caused by faulty feeding. Too great a quantity of soft feed or the giving of soft feed in too sloppy a condition may cause this trouble. If the ration is lacking in animal protein feeds such as meat scrap and mineral matter, the goslings may appear weak on their legs and throw fits.

It is well, therefore, to supply an ample amount of grit and gravel. In addition, the goslings should be fed a mash consisting of two parts of midlings, one part of corn meal and five per cent of meat scrap. Chopped grass or other green feed is quite essential before the goslings are turned out to pasture. H. C. K.

Truslow Chicks
—the Product of Our 48 Years of Experience in BREEDING

This year our flocks were mated with the best cockerels we could produce, together with the latest ability of eggs, but kills all the coccidia that may adhere to the shell. It is a Red, White Rock and Wyandotte. It is so popular that you must order early to avoid disappointment. Write for our Free Book and state your requirements so we can give you special prices.

We have just discovered a method which will control coccidiosis. This is the result of hundreds of experiments. No milk—no water. In fact, it is a dry feed. Send 10¢ for our special price.

The Story of Woodbine Farm

CHAPTER IV.

By W. D. ZINN

ONE evening, in the fall of 1867, my father came home from town and said to my brothers and myself: "Mr. Wilson wants a bushel of walnuts. He said he would give one of you boys a brand splinter new greenback dollar if you would bring them down to him." For me that was not a good night to sleep. Every once in a while I awoke and wondered how it would be possible for me to get that dollar.

As I look at it now, I ought to have been wondering how my two brothers and I could get it. One brother was five years older and the other was two years younger than myself. Up to this time the most money I had ever had was a silver quarter given me by mother on my eighth birthday. Not being sleepy I was up next morning before any other member of the family was out of bed.

There was but one bearing walnut tree on the farm. Before it was light enough to pick up the walnuts from the ground, I had made my way to it with two empty bags in my hands. By the time breakfast was announced the two bags of walnuts with their hulls on had been carried to the house by an exceedingly happy 10-year-old boy. After breakfast the walnuts were soon hulled and ready to be put on old Jim. I could not put them on the old family horse myself but my father offered to do it for me and I was soon on the way to town with my precious load.

The First Dollar

Arriving in town I found Mr. Wilson was not at home but at his office, for he was clerk of the court. The old colored woman said, "Bless yus soul, Willie, I takes de walnuts off fur you and den you go up to de office an Massa Wilson's gwine to gib you a brand new dollar." Never did I hear a voice that sounded sweeter. When I reached his office Mr. Wilson was busy waiting on some one who wanted to see some records. My mother had told me never to bother older people when they were busy, so I backed around against the wall and looked about the room in which, so far as I knew, greenback dollars were made.

It seemed that Mr. Wilson would never get through with his visitor, but he finally did and said to me, "Willie, did you bring me the walnuts?" "Yes," said I, "they are down at your house."

"Well," replied Mr. Wilson, "here is a greenback dollar that I just made for you, and he gave it to me. I believed it, for it was crisp and looked as though it had never been handled. I thanked him for it and put it into my pocket. I had no pocketbook, for up to this time I had had no use for one.

Having mounted old Jim, I rode toward home. But the fear that the dollar might slip out of my pocket disturbed me so I took it out and carried it in my hand. Several times on the way home I stopped to read the inscription on that dollar bill. I dreamed dreams, built air castles and bought purely imaginary candies, figs and dates.

A Growing Investment

It was a hard battle I fought on old Jim as I rode home. But before the house came in sight I had won a victory that perhaps meant more to me than any other I ever achieved. In so far as finances are concerned, I made up my mind that I would hold on to that dollar until I could use it to a better advantage than by buying candy with it. On arriving home I gave it to my mother, who locked it up in the bureau drawer.

Not many months elapsed until I began to think that if I left that dollar in the drawer for a whole year

it would not grow any. I believed then, as I do now, that things should grow. Probably the thought of the Biblical character who buried his one talent came to my mind.

I see no reason why I might not have recalled this incident, for before I had arrived at the age of ten my good mother had required at least that I read the New Testament through every year. I began to think after this manner: "If I take that dollar and buy something that is alive it will soon grow into more dollars. What can I buy with one dollar? Chickens are not profitable. Sheep are very low in price. I believe I'll buy a lamb."

Billy Walnut Purchased

Early in the spring the lambs began to drop in my father's flock of ewes. There was among the lambs an outstandingly good one, and I made up my mind to try and buy it. (If in after life I had always practiced buying nothing but good animals, it would have been much better for me). "What will you take for that big eared lamb?" I asked my father one day. "What will you give me?" was his prompt reply. There was a challenge for me to show my business qualifications.

I knew the lamb was worth more than a dollar, but I thought perhaps I would come nearer my father's heart if I offered him less than it was worth, so I said, "I will give you all the money I have."

My father contended for a while that the lamb was worth more money, to which statement I demurred. Finally he said, "Give me your dollar and take the lamb."

I handed the dollar to him with as much pleasure as had been mine when I received it from the hand of Mr. Wilson. I hope I was not selfish when I fed that flock the next winter, but of one thing I am sure, Billy Walnut always had plenty of room at the table. To me it seemed that he grew faster than his mates.

In those days sheep were sold as yearlings. One of our neighbors, James Woodford, came to buy our flock. My father closed the deal with him at \$2.50 per head, but said: "This lamb," pointing to Billy Walnut, "belongs to Willie and you will have to trade with him for it."

Cattle Dealer Now

"Well, I will give the same for his lamb," said Mr. Woodford.

"No," I replied, "my lamb is the best one in the flock and I will keep Billy Walnut if you don't give me \$3 for him."

The sheep were being driven toward the road and thinking he was not going to give me the \$3, I made a dash into the flock and was about to seize Billy Walnut when Mr. Woodford called out, "Let him go, I will give you your price."

He meant all the time to give me my price, but he pointed out the defects of my sheep in order to train the boy, as he afterward told my father. Three greenback dollars, all my own! Reasoning as before that these dollars would mean little if not used, I began to inquire about to find some good investment for my money. I heard of a widow five miles away who had a calf three or four weeks old that she wanted to sell. But how could I get the calf home?

I finally conceived the idea that if I could induce my younger brother to go with me, we two could lead the calf home. I suspect I had to point out to my brother the many pleasures we would have in walking that five miles and the fine sport it would be to lead a calf that distance. I must have had quite a time convincing him

Add To Your Profits

Increase your potato profits by high-pressure spraying with the BEAN Giant Double Pressure Potato Sprayer, a big-capacity outfit for large acreage or combination of potatoes and orchard—10 gals. and better per minute at 300-100 lbs. pressure. BEAN Giant Three-Cylinder Pump, Threadless and Trouble-Free Ball Valves, Dependable Pressure Regulator, Rotary Adjuster, Heavy Eccentrics, many other features.

BEAN Traction Sprayer No. 6000

A perfectly balanced low-shafting traction sprayer of big capacity. Maintains even high pressure. Convenient and dependable.

BEAN Traction Duster No. 322

A dependable all-around duster of big capacity, simple design, and dependable operation. Large Adjustable Timken Tapered Roller Bearings throughout.

that the pleasures of the trip would more than offset the trouble of making the journey. How else could I have got him to go? I had no money to hire him.

On arriving at the widow's I told her our mission. She gladly showed us the calf. It was what I would call an ugly dun, one of the sort that, after more experiences, I would not walk across the road to look at. But it was alive and would drink milk from a bucket. I was highly gratified when the widow said that she would take \$3 for it—just the amount of money I had. When I think of the incident I wonder if Providence did not have something to do with the widow's selling the calf at \$3.

No Veal for Bear

I did not try to buy the calf for less money. The halter was put on and then the fun began, just as I had told my little brother it would. We had quite a time preventing the calf from getting away from us. Nothing of special interest happened on the way home, although I remember that when we passed some wood land we saw a wild bear under a tree. We urged the calf along very rapidly until we got out of sight of the bear. Our mother did not have to rock us to sleep that night. We both went to bed early and slept soundly. My brother may have dreamed about the bear, but I dreamed of calves.

Time soon rolled around and my calf had become a two-year-old steer. My father sold his mates and said he would sell "Dan" if I would let him go. When he was run across the scales it was found that he would bring \$32.50. Long before this I had begun to crave an education. I began to see in this money the nest egg which, when properly hatched, would bring about the desired end.

I might have gone on speculating with this money, but I wanted to make sure of what I had, so I offered to loan this sum to my father, provided he would pay me interest on it, which he agreed to do. In those days there were but few colleges in the country and no high schools. Having passed the age of 16 years I felt that if I was ever to have an education I must begin to obtain it.

In the fall of 1874 a life-long friend, neighbor, classmate and teacher, the late D. W. Shaw, had been hired by three farmers in the eastern part of the county to teach what was then called a "Select School," that is, a school composed of teachers and those preparing to teach. My mother said, "Willie is now 16 years of age. If he is ever to have an education it is time now that he should begin to get it."

A Good Friend

There were three older children in the family, children of my father's first wife, and they had never received any special school advantages. I did not appreciate it then, but I now see how difficult it was for my father to give me a better opportunity for obtaining an education than he had been able to provide for the older children. Another thing that made it still harder was the fact that he did not have the "wherewith" to educate me. We found that it would just about take the proceeds of the note I held against my father to pay my expenses at the school, and I agreed to turn that note over to my father if he would let me go.

At the close of the school a teachers' examination was held at Philippi, the county seat. Mr. Shaw prevailed upon me to take this examination. From the first day of the school until the last, he had tried in every conceivable way to prepare his pupils to pass not only the teachers' examination but every test of whatever character that might be confronted in life. All his life as a teacher, many, many years, was spent in trying to develop manhood and womanhood.

GOULDS OFFERS EVER-OILED Water Systems For Every Farm

Famous Line Extended to 12 Sizes and Styles. All Lubricated for Life. All Pumps Guaranteed for Two Years

GOULDS Ever-Oiled Water Systems in a range of twelve sizes and styles are now available to meet the water requirements of every farm and home.

These Ever-Oiled water systems are all designed for economical, trouble-free operation. The ball-bearing pump requires no attention; it never even needs oiling; the ball bearings are packed in grease—lubricated for life. The gland packing is kept constantly tight by a new spring-tension gland; all working parts are of bronze—for long life; automatic air-volume control keeps just the right amount of air in the tank. And the pumps are unconditionally guaranteed for two years of satisfactory service. If during the first two years the pump fails to live up to our guarantee we will replace it.

Ever-Oiled Outfit W-205

Complete pressure tank system. Supplied with pressure switch and relief valve and with 42-gallon galvanized-iron tank, and connecting pipe and fittings and automatic air-volume control. It has a capacity of 210 gallons an hour and costs \$104 complete. It is driven by 1/4 h.p. electric motor and is fully automatic in operation.

Ever-Oiled Outfit W-46

Combination fresh water and pressure tank system. Supplies fresh cold drinking water direct from well or spring to faucet. Water for general house supply is taken from storage tank. It has a capacity of 210 gallons an hour and costs \$105. Includes 1/4 h.p. electric motor, A.C. or D.C., 42-gallon galvanized tank, fittings for connecting pump and tank, pressed steel base for pump and motor. Automatic air-volume control, electric pressure switch and all necessary accessories.

Where Ever-Oiled Water Systems are Obtainable

The complete line of Ever-Oiled Systems is now available through the following distributors or their dealers:

ALLENTOWN, PA.: Wm. H. Taylor & Co., 250-56 Hamilton Street.
BALTIMORE, MD.: Chatard & Norris, 218 Water Street.
LANCASTER, PA.: Henry R. Herr, The Pump Man, Ann and Fulton Streets.

READING, PA.: Lang Engineering Company, 344 Walnut Street.
YORK, PA.: Geo. F. Matters' Sons, S. Water and Princess Streets.

For those interested in information on specific pumping problems, Goulds Pumps, Inc., has a wealth of information that is available at any of the above distributors or their dealer in your neighborhood. Let them help you solve any of your pumping problems. If your dealer can not give you the desired information write us for catalogue showing the complete Water System line.

GOULDS PUMPS

SENECA FALLS, NEW YORK

THE YOUNG PEOPLE

The Eskimo Tragedy

SUGGESTIONS for staging—Footlights, several red-headed girls with paper bags on heads labeled, "Ye footlights," bags to be removed when play begins. Chairs draped with sheets, labeled, "Ye Icebergs," a tall girl at either side of the stage labeled, "Ye Curtain Pole." Two or three girls with frills of colored paper around their necks and frilled paper caps are brought in by the stage manager and seated behind the footlights. Around each is fastened a band of red paper, to represent a flower pot, and each is labeled, "Ye Potted Plant."

Cast—Eskimo, Eskimaid, Fido, the Dog, Eskimurderer, the Rival.

Costumes—Eskimo and Eskimaid in fur coats with fur muffs on the head and on each leg. Fido is represented by a girl, on all fours, covered with a fur rug. On the rug is the sign "Fido." Eskimurderer is dressed much as the Eskimo.

Properties—Fur collars, muffs, etc., to line the grave. Moth balls. Large spice or pepper box.

Someone reads the poem while the acting goes on—

Mid Greenland's polar ice and snow
Where watermelons seldom grow—
It's far too cold up there, you know—
There lived a bold young Eskimo.

Beneath the selfsame iceberg's shade,
In fur of bear and seal arrayed—
Not over cleanly, I'm afraid,
There lived a charming Eskimaid.

Throughout the six-months night they'd
spoon—

O, ye in love, think what a boon!
To stop at ten is far too soon
Beneath the silvery Eskimoon.

The hated rival now we see,
You spy the coming tragedy—
But I can't help it, don't blame me—
An Eskimurderer vile was he.

He spied the fond pair there alone,
He killed them with his axibone.
You see how fierce the tale has grown—
The fond pair died with an Eskimoon.

Two graves were dug deep in the ice
And lined with fur, moth-balls, and spice.
The two were buried in a trice,
Quite safe from all the Eskimice.

Now Fido comes, Alas, too late—
I hope it's not indelicate
These little incidents to state—
The Eskimurderer he ate.

Upon an Eskimo to sup
Was too much for an Eskimup.
He died, His Eskimemory
Is thus kept green in verse by me.

Winter Sports

WHO doesn't like winter and all the good times it brings?

"Oh! Goody!" the boys shout, "it's going to snow."

And then when you wake up in the morning and the ground is covered with white flakes you begin to wonder if your sled runners are still bright and shiny. But, alas, the school bell rings and off you go. My, how good you are all day—but you know it isn't the teacher's scolding taking effect—it's because you don't want to be kept in after school.

Four o'clock in the evening sees a crowd of girls and boys coated and gloved, pulling their sleds up a long hill. At last the top is reached. "Who's going with me?" "I will." "Hurrah!" "Give us a push." And off they all go at top speed.

Here's a different track than a sled makes. Yes it's skills. They are skating too. See how they lean forward to go the faster; how smooth they glide. There one hits a hump and dives into the snow, up he comes laughing and starts all over again.

Can you see the skaters on the pond? Notice the clubs they carry; they are playing hockey, backward and forward they go. Here comes a sleigh—packed full and every one singing that old popular song:

Jingle bells, jingle bells,
Jingle all the way,
Oh! What fun, it is to ride
In a one-horse open sleigh.

The sound grows plainer as they near and then gradually dies away into a soft mellow strain.

I have mentioned a few of the

Melvin Hart, Guernsey Calf Club member, Montgomery county, Pennsylvania, winner of cup presented by Quaker Oats Company for best senior animal in the sixth annual round-up.

ARE YOU A GOOD MEMBER?

Next month brings three special days—Valentine Day, Lincoln's and Washington's birthdays. Let's all get busy and send in something special—either drawings or stories to make our page more interesting. There will be prizes for everything published.

Send your letter to Young People's Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

winter sports I like and if I were asked to tell the one I like best, it would be a hard task indeed.

Barbara E. Shoemaker.
Pennsylvania.

Limerick Winner

Prize line about "Mr. Hen" is credited to Edith V. Carl, Perry county, Pennsylvania. Her line reads—
"Of roast rooster, she's now a loud booster."

Dick Writes About Apples

I AM sending you my answers to the Kate puzzle. My mother helped me with a few questions for I think it was too hard for ordinary kids to solve very easy. I have a lot of puzzles I could send you, if you want me to? Here are a couple to use if you like my kind of puzzles. My schoolmates all call me Dick. I am,

Yours truly,
Richard Stear,
Pennsylvania.

- Varieties of Apples**
1. What was the farmer's name?
 2. Describe his features.
 3. Of what material was his coat made?
 4. What was his disposition when crops failed?
 5. What did he say of his field in the spring?
 6. What did his wife always wear?
 7. Where did his sugar-cured hams come from?
 8. What style did he choose in shoes?
 9. What apple did he like best?
 10. By what measure did he sell his apples?
 11. What did he call the thieves who stole the apples?
 12. What was the name of the husky farm-hand?
 13. What did he hope to be some day?
 14. What were some pretty flowers that grew on his farm?
 15. What did the fellows call his daughter?
 16. What was the name of the city boarder?
 17. What did the city boarder say of the dessert?
 18. What did the farmer's daughter call the hours she spent with her sweet-heart?
 19. Whose compositions did she play most on the piano?
 20. Who did she resemble strongly?
 21. As whom did she regard her father?
 22. Her Dad said she was as proud as....?
 23. What did she say of her father's jokes?
 24. What intoxicating apple was never served to their guests?
 25. Where did the farmer spend his vacation when the harvest was over?
- If you can find apples enough to answer all these questions and send your letter, accompanied by a short story on "The Most Interesting Advertisement in This Week's Paper," you may be lucky enough to win one of the four book prizes offered. Hurry your letter along to Puzzle Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Admiral Dewey

NO, this is not the story of a stirring battle at sea, nor the account of bravery of some great man. It is simply the story of my pet, a little black rat-terrier. Born in the midst of a blizzard, he alone of his brothers and sisters survived. He was more than a pet to me—this little dog.

I was six years old at the time he was brought to my home; he was everything to me—companion, playmate and confidant, for my childhood was a lonely one. When I dressed him in some of my old clothes and put him in the cradle, he would lie there like a baby and sleep while I performed

my "household duties" in my attic playroom.

He was pampered and petted by us all, father, mother and me. But was he spoiled? No. His heart beat true with courage, love and perseverance until the day of his death. No task was too great for him. No other dog too large to tackle. He was also the most industrious little rat hunter I have ever seen. He knew many tricks and loved to perform.

How he loved sweets! His ears would shoot up (that is, one would the other always would flop over) and his little brown eyes sparkle with anticipation at the rattle of a paper bag, for his sweets were bought separately. How his little body would quiver and wriggle with excitement and eagerness when the horse was geared to the town, rode half the distance to the town, nine miles away before his presence was discovered.

Then came the day eight years from his birth when his brave little heart could no longer withstand the burdens imposed upon it, and I lost the best companion I had ever had.

Mary Mandrell

Maryland.

Two small girls were playing together one afternoon in the park. "I wonder what time it is?" said one of them at last.

"Well, it can't be four o'clock yet," replied the other with magnificent logic, "because my mother said I was to be home at four—and I'm not!"

A Scotchman sued a baseball company because he was hurt watching a ball game. He fell out of a tree.

Little Folks' Corner

Drawn by ADA L. KREIKLE, Pennsylvania

Here are the three Bears on their way to a party, church or somewhere. If Daddy weren't there, Little Bear wouldn't dare stick out his tongue at you but you must excuse him because he's only a baby and doesn't know any better. What a fine chance to use your new crayons or paints! Color the bears and hurry them back to Little Folks' Corner, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa. There will be prizes for the best colorings.

1. Miami Beach, Florida.—Photo shows a contrast to his dad—Tommy Milton, Jr., son of the retired world champion racing driver, riding on a lumbering old 200-pound turtle here.

2. President Hoover reviewing members of Boy Scout Troop Number 166, of Kingsbury, Pa., who came to Washington on a holiday trip financed by the sale of 3,000 pounds of candy, made and sold by members of the Troop.

3. Stockholm, Sweden.—Photo shows model of "The Novelty" designed by the inventor of

the Monitor. Captain Ericsson entered his engine in competition with Stephenson's "Rocket" and outdistanced his competitor until engine trouble forced the Swede to drop out.

4. Cardington, England. The R-100, Britain's huge new dirigible, is shown here moored to her mast at Cardington after her maiden flight during which she averaged slightly more than 70 miles per hour with a full crew. A detachment of 500 soldiers was required to haul the silvery bag to earth.

5. Miami Beach, Fla.—Photo shows Rosie, pet elephant, giving a lift to a fair motorist whose car got stuck in the sand on the beach here. Rosie is always willing to lend a helping trunk.

6. Southampton, England.—Photo shows an unusual shot of men shipping the funnel on the great Majestic which is in drydock here. They look like flies on a tin can, which gives an indication of the size of the funnel.

SILOS -- Reduced to February 1st only

Because of impassable roads during December making it impossible for us to see all those who asked us to send a representative, the special early season discounts have been extended through January ONLY. Your LAST CHANCE to save an average of \$50 per Silo. Choice of wood stave, triple wall, tile and the NEW Concrete Stave. Don't delay—sit down NOW and write us.

"Send me Catalog and Prices."

CRABE, Inc.
10 Grant St., Norwich, N. Y.

\$25 EXTRA Profit per Cow

A Wisconsin cow testing association found that silage-fed dairy cows gave an extra profit of \$25 each. A Pennsylvania survey proved that cows produce 1,200 lbs. more milk per year, thanks to silage. Experiment station averages show that silage saves 12c on the cost of producing a pound of butter and \$1 on every 100 lbs. of beef.

All things considered, you can produce silage at \$4 a ton. That's a mighty low price to pay for the feed that makes you your biggest profit. A new Papec Ensilage Cutter will put more even-cut ensilage into your silo at a lower cost per ton than any other cutter. That's why there are more Papecs in use than any other make.

Write for the 1930 Cutter Catalog. It gives figures on silo filling costs and tells how they can be reduced.

KEYSTONE AYRSHIRES FOR OHIO STATE

Intent on establishing the foremost college Ayrshire herd in this country, Professor S. M. Salisbury, in charge of dairy production work at the Ohio State University has selected five daughters of Penshurst Charming Prince from Penshurst Farm, Narberth, Pennsylvania, to add to the choicely bred herd at the Buckeye institution. Penshurst Charming Prince is a son of Penshurst Champion Princess, a remarkable individual in the Penshurst herd with six records averaging 10,000 pounds of 4.6 per cent milk. These five daughters of Penshurst Charming Prince are considered the choicest group of heifers that has been brought into Ohio in the past ten years. In addition to the breeding on their sire's side, they are all out of daughters of Penshurst Man O'War.

Farm and Dairy

By L. W. LIGHTY

As a rule it is unwise and unprofitable to cross breeds. True, there are exceptions, but so it is with all rules. In crossing breeds too often we get many of the undesirable qualities of sire and dam, and few of the desirable qualities in the offspring. As the common expression has it, we get nowhere in crossing different breeds of cattle.

Some one has told you the fine breeds of livestock and poultry were originated by cross breeding. That is true in a measure, but the informant did not tell you of the great number of worthless progeny produced before one individual occurred that contributed toward the founding of a new breed. Originating new breeds is a business by itself and the farmer who needs to make a living is foolish to consider it.

But this question more often concerns the crossing of grades rather than pure-breds, and here results are decidedly bad. Any one who has studied this matter has seen thousands of mongrels and scrubs in cattle and swine following this idea of breeding. Yet there are exceptions.

I know a man who keeps three to five cows, but no bull. He depends on bulls kept by larger farmers in the community. He bred a grade Jersey to an excellent registered Jersey bull and raised two heifers, both excellent milkers. Later the only good bull available was a Guernsey, and now this man has three cows of the grade Jersey and Guernsey cross, which are better milkers than he ever had. This, however, was a cross of related types.

Grade Breeding

Thousands of farmers are not in a position to own a registered herd and have no desire to take all the trouble necessary to keep up registration in its details. These people do well to adopt an intelligent line of grade breeding. Select the breed best adapted to your work and conditions and stick to it. In the half-bloods many have to be weeded out, but with the three-quarters there are fewer culls and if your culling has been well done to the thirty-second your stock for utility purposes are not greatly behind the run of pure-breds. A well-selected, registered bull and intelligent culling will bring you a profitable herd.

Soy Beans for Feed

"I have about 65 bushels of soy beans for which I am offered two dollars a bushel. I fed the screenings and found it very good feed. The cattle also readily eat all the chaff and stems. Will it pay me to sell the

beans and buy linseed and cottonseed meal, half and half, for feed at \$65 and \$55 a ton respectively? What is the relative value of these feeds?"

This from a Maryland reader. Possibly the correct answer briefly would be, feed the soy beans.

But what are the relative values?

	Protein	Energy
Soy beans	21.6	\$1.29
Linseed meal	30.9	\$5.12
Cottonseed meal	35.4	\$6.46

We see the soy beans are a little lower in the nutrients than the other feeds. It is also a fact that in feeding trials at experiment stations the soy beans gave as good results as did cottonseed meal.

We also know that whole grains as they grow possess ingredients that are partly or wholly lost in processing. The life element does not lend itself to analysis.

Furthermore, to make the trade proposed there would be the cost of the transaction, which might fully cover the seeming difference as viewed in cold figures.

For these reasons I said that possibly the correct answer is to feed the beans. It would be interesting to compare results right in the farmer's stable, if he is of an inquiring mind, by feeding soy in one ration and cottonseed meal in another. This is a little trouble, but to me the pleasure of knowing first hand was always greater than any trouble. The soy bean is a newcomer since I quit scooping feed to the cows, but it is a crop that is more largely grown every year both for hay and grain and the feeding results justify the increase.

The Ninety and Nine

The greatest Preacher of all time once related a very beautiful and impressive parable of the man with a hundred sheep and losing one. In my day a singer made a hymn about it and we sang it until it became a familiar idea. The value of the minority is magnified by the idea.

I desire to apply the idea from a different viewpoint. A goodly number of us have gone over established facts so often that we come to think the truths in them are universally conceded.

Lately a bright, courteous young man called on me. In the course of our conversation he informed me that he had occasion lately to make a house-to-house canvass over a good part of a neighboring state and was surprised to find communities where there was a strong sentiment against silos. These people believed silage was very injurious to cattle. This belief of theirs went so far as to induce

If you need a silo You Need a UNADILLA

...the strongest, safest, most efficient silo on the market. Because of its perfect, air-tight, water-tight and frost repelling construction, the Unadilla preserves every pound of green corn or other silage put into it. The valuable juices are retained and there is never any risk of mouldy silage.

C. T. A. Reports

Bedford County

THE Bedford County Cow-Testing Association finished its fifth year December 1st, 1929, with 22 whole-year and four part-year members. There were 482 cows in the Association during all or part of the year.

The results for the Association for the five years are as follows:

Year	Av. No. Cows	Lbs. Milk	Lbs. Fat
1925	301.94	5670	272.2
1926	283.26	6104	305.3
1927	276.29	5801	314.2
1928	298.57	7127	351.08
1929	300.25	7395	332.2

Eighteen herds with an average of five or more cows exceeded an average production of 300 pounds butterfat. A complete list of these herds follows:

Owner	Breed	Lbs. Milk	Lbs. Fat
John E. Morris	R.&G.J.	7797	434.5
McKinley Woy	R.&G.C.	5894	432.4
Stanley Koonitz	R.&G.J.	7813	426.3
Allen Eshelman	R.J.	6958	371.7
Paul B. Stayer	Mixed	7941	367.6
Ross T. Snider	Mixed	9206	359.3
George Morgart	R.&G.J.	7317	359.1
E. S. Perry	R.J.	6510	356.2
Fred Cox	R.J.	7199	353.1
W. D. Koonitz	R.&G.H.	9946	351.7
John S. Hershberger	R.&G.J.	7032	350.7
J. W. Stair	Mixed	9232	319.8

Sam C. Diehl & Son	Mixed	7599	306.1
Samuel Cessna	R.&G.H.	5522	302.6

Willard Straw, L. R. Mollenauer, Tester. County Agent.

Gelatt—So. Gibson

THE Gelatt-South Gibson Cow-Testing Association finished its third year, December 1, 1929, with 24 whole-year members. In addition there were two members in the Association only part of the year. There were 479 cows in the Association during all or part of the year.

There have been ten herds in this Association for three consecutive years. The following is the result of these ten herds for each year.

Year	Av. No. Cows	Lbs. Milk	Lbs. Fat
1927	136.25	5884	309.8
1928	141.59	5571	300.1
1929	110.11	9201	324.6

Eight herds produced an average of 300 pounds of butterfat. A complete list of these herds follows:

Owner	Breed	Lbs. Milk	Lbs. Fat
Curtis Allen	F.&G.H.	11680	402.5
F. E. Ressegule	R.H.	10621	380.5
E. B. Gillett	R.&G.H.	9916	270.2
S. J. Horton & Son	R.&G.H.	10656	361.1
Paul Hayden	R.&G.H.	10856	360.2
Cordell Allen	G.H.&E.L.	9981	351.0
Arthur Howell	R.H.	9514	337.0
C. E. Pickering	G.H.	9085	308.4

B. E. Whitney, Tester. G. H. Dale, County Agent.

If you permit a barn-full of cows to go through a long period of winter feeding without conditioning aid—you are passing up real money. Very few animals enter the stable in the Fall with the stamina and vigor to get all the milk-values out of the dry winter ration. Digestion and assimilation soon get sluggish—expensive feed goes to waste.

and assimilation enables the cow to thrive and yield to capacity on her natural diet. Feed that costs you real money is conserved and converted without waste.

Condition with KOW-KARE before Calving

For the shock and strain that calls upon every reserve of bodily vigor, each freshening cow should be prepared by a regular period of KOW-KARE conditioning before and after the ordeal. Many troubles that arise only at calving time are effectively avoided if normal vigor is maintained.

KOW-KARE is sold by drug, feed, hardware and general stores—\$1.25 and 65¢ sizes. Directions on each package.

READ THE ADVERTISEMENTS TO KNOW WHAT IS BEST AND WHERE TO BUY

Farmer's Business Letter

LAMBS worked lower this week. The loss amounted to 65 to 90 cents compared with last week's close, and sheep declined more than lambs. Receipts were about normal for the time of year, a little smaller at twenty points than last week. Average price here at \$13.35 showed a decline of 25 cents compared with last week and was \$2.95 under the same week last year. It is a discouraging time for feeders.

The government issued a depressing report on the extent of feeding, showing a big increase over a year ago. The report stated that the number of sheep and lambs on feed for market in the principal feeding states on January 1, 1930, was about 700,000 head or 15 per cent larger than on January 1, 1929. The number estimated on feed this year was 5,490,000 head compared to the revised estimates of 4,792,000 head January 1, 1929 and 4,463,000 January 1, 1928.

Cattle Lower

With receipts rather liberal buyers were successful in forcing a lower level of prices in the cattle market this week. The steer market generally was off 50 cents to a dollar, yearlings showing the most decline. Butcher stock was also as much as a dollar lower.

Receipts here at about \$10,000 compared with 48,000 a week ago, but seven markets had only a few more cattle than a week ago.

Best steers this week brought \$16, that price being paid for both yearlings and heavies. Last week best heavy steers sold in the same notch, but yearlings brought \$16.75. Average price of steers this week was \$12.85, against \$13.25 last week, \$12.45 the same week last year, and \$13.85 two years ago.

A program to raise about \$100,000 per year to promote beef consumption through the National Live Stock and Meat Board has been adopted by the executive committee of the American National Live Stock Association. This sum is to be raised by a levy of one cent per head on all cattle and calves sold at public markets or at private sale by the members of the American National Live Stock Association. Collection of the fee at the public markets will be made through the offices of the live stock commission firms who sell the cattle and calves for the members of this association. It is declared that this program is a stepping stone toward a much larger appropriation from the members of the American National Live Stock Association in future years.

Hog Position Strong

Hogs worked down a little this week, under the stress of heavy runs on some days, but advanced promptly when supplies let up, and closed in about the same notch as a week ago, with tops worth \$10 and at times a little more. Average price for the week figured at \$9.60, against \$9.65 last week, about half a dollar higher than a year ago. Weight is about normal for time of year, and quality is good. Receipts at eleven markets this week totaled 645,000 against 730,000 the same week last year, and 840,000 two years ago.

Total lard in storage in the United States on Jan. 1 was \$2 million pounds, against a five-year average of 59 million pounds for the same date. Except for Jan. 1 a year ago, and in 1919, it is the largest accumulation for the date on record.

Of pork, the Jan. 1 total was 625 million pounds, against a five-year average of 557 million pounds. With four exceptions it was the largest total for the date on record.

Federal inspected hog slaughter in December was around 700,000 head, or 12 per cent, less than in the same month a year earlier, and so far in January receipts at 11 points have totaled 1,644,000 head, compared with 2,166,000 on the same date last year, a decrease of 24 per cent. These slaughter and receipt figures explain why a bullish feeling prevails with respect to hogs.

Wheat Market Weak

Wheat prices have taken something of a jolt this week, and corn and oats are both closing a little lower, apparently in sympathy with wheat. Early in the week the Farm Board's statement that it would do everything possible to bring about a reduction in spring wheat acreage put a little life in the market, but a severe decline in the

Canadian market had its effect on this side of the boundary later on. A report from Winnipeg said that the only reason that grain men and the public could give for the break in Winnipeg wheat prices was that some of the banks were getting tired of carrying the wheat and were forcing customers to let some of it go. Most of the banks have been carrying west Canada wheat for 18 months. This wheat was bought at \$1.18 and it has cost since then 30 cents a bushel to carry it, while wheat is worth only \$1.20 in Winnipeg today.

Chicago, Jan. 18, 1930 Watson

LIVESTOCK

PITTSBURGH

Cattle

Monday's receipts were light, about 30 carloads being on sale. The market was steady to strong on most grades. Demand was especially good for the better kinds of steers, while some slowness was evident on plain steers and heifers. Several loads of fat heavy steers sold around \$13 with useful butcher steers at \$12.50 to \$12.75 and plainer kinds at \$11.50 to \$12. Few steers had to sell below \$11. Best heifers were strong, a few of choice quality going at \$11 and useful kind at \$10 to \$10.50. Cows were generally easier, most fat cows going at \$7 to \$8, with an occasional choice one up to \$10. Bulk of bulls went at \$8 to \$10, choice heavy individuals selling up to \$11.

FEED MARKET

The following quotations are for transit and nearby shipment January 17, according to the U. S. Bureau of Agricultural Economics. They show the approximate cost of feed per ton (all in 100-lb. sacks) and grain per bushel in carlots arrival draft basis delivered on track at Philadelphia and Scranton rate points:

Barley, \$35.50@37.50; standard middlings, \$35.50; flour middlings, \$36; cottonseed meal, 43 per cent, \$47.50; gluten feed, \$42.50; No. 2 white oats, 55c; No. 2 yellow corn, \$1.04.

HAY AND STRAW

Philadelphia quotations.—No. 2 timothy, \$18.50; No. 3 timothy, \$15.50; sample hay, \$13; No. 1 mixed clover, \$18; No. 2 mixed clover, \$15.50.

No. 1 straight rye, \$18.

CHICAGO

Chicago, Jan. 20.—Eleven thousand head made up the supply. The market was a quarter higher with top at \$16.

Fifty-five thousand head, including 30,000 shipped direct to packers, made up the hog receipts. The market was 25¢ to 40¢ higher with top at \$10.65. Bulk of sales was at \$9.70 to \$10.40.

With 15,000 sheep and lambs on sale the market was steady to 25¢ higher. Best lambs brought \$14.25.

Philadelphia Produce Quotations

PHILADELPHIA

Butter.—Higher than extras, 37¢@40¢; 50 score, 38½¢.

Eggs.—Extra firsts, 47½¢; firsts, 44½¢; seconds, 41¢@43¢.

Poultry.—Live, fowls, 22¢@31¢; chickens, 22¢@27¢; old roosters, 22¢@23¢; pigeons, pr. 28¢@35¢; ducks, 18¢@25¢; turkeys, 25¢@33¢.

POTATOES, Pa., 100-lb. sack, \$2.75@3.00; SWEET POTATOES, N. J., 4 basket, 90¢@1.00; MUSHROOMS, Pa. & Del. 3-lb. baskets, white, 90¢@1.00; PARSNIPS, Pa. — N. J., 5¢@6¢.

Vegetables.—BEANS, Fla., bu. green flat, \$2.50@3.50; BEETS, N. J. & Pa., ½ bkt., 25¢@50¢; CARROTS, N. J. & Pa., ½ bkt., 25¢@50¢; CELERY, N. J. & Pa., per bunch, 12¢@15¢; POTATOES, Pa., 100-lb. sack, \$2.75@3.00; SWEET POTATOES, N. J., 4 basket, 90¢@1.00; MUSHROOMS, Pa. & Del. 3-lb. baskets, white, 90¢@1.00; PARSNIPS, Pa. — N. J., 5¢@6¢.

LANCASTER

Butter.—Country butter, 54¢@60¢; creamery butter, 49¢@55¢.

Eggs.—Fresh, 45¢@50¢; pullet eggs, 40¢@43¢.

Dressed poultry.—Chickens, 31¢@32¢; ducks, 15¢@20¢; turkeys, 25¢@30¢; geese, 15¢@20¢; squabs, 25¢@30¢ each.

Fruits.—APPLES, N. J., 20¢@30¢ ¼ pk. CRANBERRIES, 20¢@25¢ per lb.

Vegetables.—BEANS, (string), 30¢@35¢; peas, 30¢@35¢; Lima, 35¢@40¢; pea box BEETS, 8¢@10¢ bunch. BRUSSELS SPROUTS, 25¢@30¢ qt. CABBAGE, 8¢@15¢ head. CARROTS, 8¢@10¢ bunch. CAULIFLOWER, 20¢@25¢ each. CELERY, 10¢@20¢ bunch. CUCUMBERS, 8¢@15¢ each. EGGS PLANTS, 20¢@30¢ each. ENDIVE, 5¢@10¢ head. LETTUCE, 10¢@20¢ head. MUSHROOMS, 25¢@30¢ per pt. green. ONIONS, 2¢@25¢ ¼ pk. POTATOES, (green), 10¢ bunch. POTATOES (sweet), 25¢@30¢ ¼ pk. PEPPERS, 3¢@5¢ each. PARSLEY, 2¢@5¢ bunch. PEAS, 30¢@35¢ ¼ pk. RADISHES, 1¢ bunch. RHUBARB, 10¢@15¢ bunch. SPINACH, 12¢@15¢ ¼ pk. TOMATOES, 25¢@30¢ pint box. TURNIPS, 15¢ ¼ pk.

With 125 calves on sale the market was steady. Top yearlings sold at \$17.50 per cwt. Good steers \$12 25@13 00
Medium to good \$12 25@13 00
Common to medium \$9 50@11 50
Good to choice heifers \$7 50@9 50
Common \$7 50@9 50
Good to choice cows \$7 50@9 50
Common and medium \$7 50@9 50
Cutter, common and medium \$7 50@9 50
Feeder and stocker cattle \$7 00@11 75
Good to choice calves \$15 00@17 50

NEW YORK

Butter.—Creamery, higher than extras, 35½¢@36¢; firsts, 31¢@34½¢; seconds, 2¢@30¢.

Eggs.—White, nearby, average extra 41¢@43½¢; extra firsts, 43¢@43½¢.

Poultry.—Live, by freight, fowls, 20¢@22¢; old roosters, 17¢; geese, 20¢; ducks, fancy 22¢.

WOOL MARKET

Boston, Jan. 18.—The wool market has been rather slow during the past week says the U. S. Department of Agriculture Market News Service. Most of the trading was done on the 64s and finer western grown wools and on the medium grade fleeces. Quotations were easier on the domestic wools of 58c, 60c and qualities below because of the easing tendency abroad on wools of equivalent qualities.

Scattered sales of small quantities of 66s and 48c, 50s both were quoted at \$9.40¢ in the grease. An occasional lot of strictly combing 64s and finer Ohio and similar wools lined at 34¢@35¢, in the grease. Other lines of fleeces were quiet.

CHICAGO CASH GRAIN

Chicago, Ill., Jan. 20, 1930.—The following cash prices ruled here today: No. 1 hard wheat, \$1.21@1.22½; No. 3 yellow corn, 85½¢@86¢; No. 3 mixed corn, 81¢; No. 1 white oats, 45½¢@46½¢; No. 2 rye, 95¢.

Philadelphia Produce Review

THE Philadelphia egg market during the past week has been largely based on sentiment and was influenced to a large extent by advices of weather conditions, present and expected, in the various producing sections. The market opened about steady but eased off somewhat toward the middle of the week in line with other large distributing points. At the close some of this loss was regained and the market ruled steady.

Nearly receipts, especially whites, appear to be running considerably heavier. Some outlets are filled at present with shipments of Pacific Coast white eggs which have been brought from New York City. Nearby white eggs ranged from 42½¢@46½¢ late in the week while brown eggs brought 38¢@48¢.

Poultry About Steady

Live fowl were quiet in New York with little change in prices. Chickens were firm despite the fact that many offerings were of rather poor quality. Pullets were in good demand and capons sold readily. Receipts of nearby live broilers were lighter and the market improved. Colored fowl were quoted at 31¢@32¢ per pound. Leghorn fowl at 29¢@30¢, chickens at 24¢@26¢ and broilers at 25¢@31¢.

Potatoes Higher

Cold weather in many sections of the country influenced potato markets and prices were generally higher. The demand at shipping points was generally good. Late in the week there was some decline at eastern shipping points due to light demand. Carlot shipments continue at the larger volume prevailing since the price advance, but supplies in the city markets have not shown any material increase. It appears that there has been some buying for future requirements.

Growers in western New York were receiving \$1.25@1.35 per bushel at loading points in mid-January. The growers are still holding their potatoes strongly and dealers in the Rochester

district have had some difficulty in filling their orders at times. Holders of potatoes in most all sections have shown a tendency to stop selling whenever the prices have fallen off a little. The potato acreage of 45,000 acres in Florida and Southern Texas compared with 32,500 last year indicates considerable competition with northern potatoes near the end of the season.

Demand for Apples Limited

The demand for apples in practically all eastern markets was limited although prices have made no material change for a month. Supplies were moderate to fairly liberal. Daily shipments of apples were heavy for mid-winter, often reaching 225 to 250 carloads. The apple movement from the Pacific Northwest was especially active for this time of year. Pennsylvania, New Jersey and Delaware apples were in moderate supply in Philadelphia. Truck receipts of Stayman brought \$1.50@2.50 per bushel, Grimes Golden \$1.50@2, Rome \$1.50@2.25 and Yorks \$1.40@1.75.

The sweet potato market showed some improvement early in the week but the demand fell off toward the close. New Jersey Yellow sweets sold at 75¢@1 per ½ basket in Philadelphia with a few fancy at \$1.10. Similar stock brought \$1.25@2.25 per bushel in New York City. Pennsylvania celery showed a weaker tendency this week and wired bunches sold at somewhat lower prices. The market for this homegrown stock may have been affected to some extent by the liberal supply of California and Florida stock which is selling at rather low prices.

W. R. W.

Farm Conditions

Wirt Co., N. W. W. Va.

Jan. 13: Weather warm and rainy. We have had very little cold weather since the forepart of December.

Many have quit selling cream and are making butter. Cream 36¢, butter 50¢, eggs 40¢, calves \$14, cows \$100@150. Lots of sickness. Roads getting bad. E. N. B.

Mifflin Co., Central Pa.

Jan. 15: Weather mostly warm and cloudy with frequent showers, which makes roads almost impassable. Some few farmers tried plowing the last few weeks, but the ground is too wet. Quite a number of men out of work since the railroad has laid them off for the winter. The milk business is booming for the farmers. Not much stock fed except cows. Hog feeding is dull on account of high cost of feed and dull sale of pork. J. H. Byler.

Frederick Co., Northern Md.

Jan. 8: Weather has been very mild. Grass and grain looking good. Farmers are busy cutting wood and butchering. Also many are putting in the improved milk troughs and milk coolers recently required by the Baltimore Department of Health. Roy J. Wivell.

Harrison Co., Central W. Va.

Jan. 12: The weather is changeable, rain every other day. Today is warm and cloudy. Snow and cold on Thanksgiving. December 23rd snow was 14 inches deep. Dirt roads very bad. Lots of sickness. Horses and cows high and scarce. Live chickens selling slowly at 18¢, butter 40¢, eggs 45¢. Genevieve Morris.

Butler Co., S. W. Pa.

Jan. 4: We had several snow falls during December which did not remain long. Farmers butchering, hauling manure, ordering spring seeds, fruit trees and fertilizer. Winter wheat and rye looking good. Work slack. Egg production increasing, price steady. Dairymen having cattle tested for tuberculosis. Farm Bureau planning year's work. Many farmers to attend State Farm Products Show at Harrisburg. Howard F. Fox.

FARMSALE

REMEMBER!
Spring Is "Just Around The Corner"
BUY THAT FARM YOU HAVE BEEN DREAMING OF NOW

Be Established on Your OWN Farm In Plenty of Time for Spring Planting.

The Federal Land Bank of Baltimore is offering a few farms at attractive prices and on attractive terms. The farms are those that it has been necessary for the Bank to take over through foreclosure proceedings, and therefore the Bank is only interested in realizing from the sale the amount due on the mortgage debt. Consequently, you can be assured of wonderful values.

There is only a limited number of farms for sale

The Modern Farmer Won't Be Fooled

Whenever he can save money on freight charges, save time and money on hauling materials from railroad station to farm, he does it. That's the big job of the farmer—make every crop cost less to raise.

No better place to start saving than with fertilizer. Dempwolfs' HIGH TEST (Double 4-8-7) fertilizer will save every farmer from \$4 to \$8 on every ton he buys. Half the freight cost, half the labor and time necessary for hauling; half the storage space. But the new High Test sacrifices nothing in efficiency. Does the job every bit as well—every time.

Write for a folder that tells you more about this finest of fertilizers.

YORK CHEMICAL WORKS
YORK, PA.

red clover and alfalfa with Uncle Sam's OK

To prevent winter-killing, to get a quick start and a vigorous stand, the origin of Hoffman Seed has always been carefully checked. But now—you have the Government's assurance, too. All our Red Clover and Alfalfa seed is tested from grower to sower, its origin certified by the Dept. of Agriculture, and delivered under seal and official tag.

Absolutely the best that you can buy. Thoroughly cleaned and re-cleaned, free from foul weeds and germination-tested.

It's a great year for these two big pay crops. Quality very high and our prices low—\$6 to \$7 under last year.

New Free Seed Book!
Full of interesting facts for the farmer. Write today for your copy, for free samples and prices.

What Our Readers Say

More Personal Experience

AS a reader and subscriber of and to the Pennsylvania Farmer, I am afforded much pleasure in reading the articles by our friend, W. D. Zinn, especially because of the fact that he and I have come up through the scrambles at about the same pace. Of course there are a few exceptions as there are in most cases. However, in glancing back over my eventful career I can see many coincidences. I shall herein relate a few of them, being brief, for it occurs to me that the P. F. is not looking this way.

In the "Story of Woodbine Farm" I note one difference in our early lives. Mr. Zinn's father owned some property but my father owned none. He was very poor. He earned his living by day's work and in an accident at an old-fashioned water saw-mill suffered a broken leg and other injuries which left him in dire circumstances for months. He recovered and later on secured a few acres of land and a neighbor gave him a blind horse that was used to cultivate his few acres. My brother, 10 years my senior, handled this noble animal.

From Horse to Tractor

My father afterwards took up stone work, bricklaying and plastering. Things were going a little better and he bought a cow from the offspring of which he raised a yoke of oxen. Old "Buck and Berry" pressed hard against the yoke and things went still better than with the blind horse. I see right here that I will never get from this old horse to the tractor mentioned by Mr. Zinn unless I cut the corners.

I said I would be brief. Well, like Mr. Zinn, I hoed corn and potatoes until I would fall asleep at the supper table. My father kept on buying a few acres to his little farm and I helped him to clear it. It was well covered with brush, more brush, lots of stone.

We began, besides raising some corn and potatoes, to raise some flax. I helped to pull it under strict orders to keep it clear of weeds. We spread it out on meadow land to dry, after which it was gathered in and kept until the busy season was over, then it was dried over a fire, broken, scutched, hackled and afterwards spun and woven by my mother, who made clothes, table covers, sacks and what not.

One day, when the process of drying the flax preparatory to scutching was going on I thought the fire needed a little encouragement, which I gave it in the form of wood and more wood. The fire was always made up when the rack was empty. I fired when it was full and burnt a whole rack of flax. I didn't need to stand with my back to the fire to get warm immediately after. I might add here that I attended Sunday school dressed in a linen waist, knee pants and a bulrush hat made by a neighbor woman. My whole outfit didn't cost a penny in cash.

Blankets Still Good

My father was a reaper, too. He could handle a sickle to perfection. One day when he was reaping a call came for him to go to the house. He told me to reap until he returned. I started in on high and cut my little finger almost off so that it is a cripple to this day.

One thing more I will mention and stop short or the editor will charge on me. Mr. Zinn mentions the short wool rolls that our mothers used to spin. I am an old wool carder. I carded enough rolls to load a railroad train a mile long. More than 40 years ago, before I was married, I made for myself several pairs of blankets out of all wool. I sold all but two pairs, which I still had when I was married 42 years ago. These blankets have been in constant use in win-

ter time ever since and are good yet. It does me good to think on these things and note the wonderful changes in our way of living now and a half century ago.

J. A. Brant.

Westmoreland county, Pa.

Potter County ice Mine

THESE winter days, when people are planning on little vacation trips, why not include the Potter county ice mine? I have not seen this mentioned in The Pennsylvania Farmer since I have been a subscriber.

It is easily reached, being near the Roosevelt Highway and not far from the village of Coudersport. It is easy to find a camping place if one likes that part of a vacation trip.

The mine is on a hillside. It resembles an old-fashioned dug well of generous size. The owner of the place has built a little house over the well, thus marring nature, but still there is much of interest left.

The hotter the weather the faster the ice forms until great icicles hang from the stony walls of the well or mine, yet water lowered to the bottom and placed on the icy floor, never freezes.

It is not customary now for visitors to be allowed to go down the ladder into the well, but when I visited it our party was small, the hour early and we went down, a leap as it were from summer to winter. Sometimes the ladder, if left in the mine, is too ice covered to be used, so I heard.

Outside are strange shaped stones that have been taken out as the hole has been enlarged. One I saw was a dull brown color and the shape was almost like a ham. The odd shapes would be of great interest to a lover of geology.

Nearby, on the hillside, grows a small fern that is rather rare in this section, the delicate oak fern. The shape resembles our common meadow brake, but it never grows to any great size.

I felt well paid for my trip there and I am sure others interested in nature's freaks would feel the same.

Penn. Reader.

Value of Seed Treatment

FEED treatment seems to be necessary these days. For a long time I could not see it that way, but I have changed my mind. One of my friends who grows a large acreage of potatoes showed me the result of treating seed potatoes. He treated most of his seed but not all. He showed me the last row treated in the field when the plants were about a foot high. The result was very noticeable in the vigor of the plants. The seed was otherwise the same.

Last season I treated about 30 acres of seed and planted about five acres without treatment. The result was that I had lots of stem rot with the untreated seed, while with the treated seed I had almost none.

I treated the potatoes with an instantaneous dip. For quite a while I was unable to decide on the method of dipping so as not to waste the liquid too much. Finally I decided on wooden candy buckets and the half bushel wire baskets generally used for potato picking.

With about half a dozen of these buckets and baskets one man can work steady and lose very little liquid. He fills the buckets about three-fourths full of the liquid and then fills the baskets with potatoes and sets them in. When he has them all filled he takes the first one out and hangs it on a support above the bucket to let the liquid drain in the bucket again, and so on to the last one till they all hang to drain. By this time the first one is quite well drained and he empties it, fills it again, dips it and hangs it, and

It Takes More Than Rocks To Break "Weed Hog" Teeth

You can do things with the WEED HOG that you wouldn't dare do with any other tillage implement, especially a spring tooth harrow. You can work the WEED HOG in the roughest, roughest land but you can't beat it for stretch or break a tooth. WEED HOG is made of tempered spring steel and is GUARANTEED FOR LIFE against breakage. They go down deep, under and alongside rocks and stones and work the rich soil there into other tools missed.

You can fit perfect seed beds with no other tool but the WEED HOG. It works deep, deep, deep, breaks up lumps and clods, thoroughly mixes the humus and leaves deep, well-mixed seed bed. Sifts, better than any other implement, the seed into the WEED HOG-prepared seed bed.

You can save time and money by spraying stubble land with the WEED HOG. It is needed, nothing but the WEED HOG. It tears out the stubble, mixes it with the soil and leaves the land ready to seed.

You can cultivate your orchard with the WEED HOG alone. It plows up the ground, mixes the soil and keeps it weed-free. The WEED HOG is a plow and harrow in one. Looks like a harrow but digs like a plow.

OUTSTANDING FEATURES
GREAT STRENGTH: The WEED HOG is made almost entirely of tempered spring steel. It is GUARANTEED FOR LIFE against breakage, stretching or breaking, even in the roughest, roughest soil.

ADAPTABILITY: Teeth may be spaced on any bar as desired. Depth of cut may be regulated without adding weights, from a few inches to full plow depth.

WORKS IN TRASH: The WEED HOG is made with ample clearance and no front bar to trash. It works plow depth in trash, straw, barnyard manure with practically no clogging.

WORKS IN ANY SOIL: The WEED HOG is rugged but extremely flexible, frame that will make it to work under all soil conditions.

empties the second, fills it, dips it, etc. He can work ahead and lose little material.

We treated all our seed corn last season and we had a good stand. Now whether this accounts for it I do not know, but I am inclined to believe that it pays to treat the corn, as they claim that treated seed will not rot in the ground and that treatment will kill fungous organism which may be clinging to the seed.

Yes, it is true we cannot afford to ignore these new fangled ideas. My wife insists on putting a disinfectant in the drinking water for the chickens when they are confined in the house, especially when there are any symptoms of a cold or other troubles in the flock. The same holds true in summer spraying of fruit and truck. We have to be continually at it or we come out loser.

Last summer we sprayed our apples only two or three times and my neighbor sprayed every time he got spray letter from the county agent and the result was that my neighbor had perfect fruit while ours was not all perfect.

So it goes; there are lots of expenses connected with good farming, in raising and selling a good crop it is not all profit.

C. R. Bashore.
Berks county, Pa.

A Lump of Sugar

I WONDERED a little today if we farmers fail to give our farm animals as much thought as we should. Our old mare, Lady, got kicked pretty bad the other night, and as I've always thought a lot of Lady I've always taken the best care of her.

You see Lady is an old family stand by. She was foaled and raised by my dad and her mother carried me safely through the days of courtship with the girl I eventually married.

Lady, like the rest of us, is no longer young, but she is still a good worker. She has taught my boys how to harness her up, drive her around the farm, put her back in the stable and in a few minutes take her out again.

But, as I was saying, Lady got kicked on the point of the shoulder. I took out a few pieces of bone and she is very lame, but she is a good worker. She never makes a bit of fuss over being doctored and in her horsey philosophy seems to think it's just part of getting well. She seems to know that she has her part to play in the spring's work and she must be ready for it.

Lady whinnies to me when I go into the barn and lets me know she is and I am still living, and that's a lot. She is a great old fogey, I know, but I am inclined to baby her a little. But that is not the point. You see I'd been dopping her shoulder tonight and she stood and watched me without a strap on her. I knew I hurt her even though I tried to be as gentle as possible, and I felt I needed to make up with her, so I took out some lumps of sugar to her and, do you know, that old mare didn't know what it was.

That just started me to thinking. I've always babied Lady. She has been a good pal to me and to think that in all these years of service I'll just bet she has never been offered a lump of sugar before. If Lady gets over this trouble she is good for many more years of work, but if she doesn't I'll always feel a little guilty that it had to be when she was down and out that I first offered her a lump of sugar.

I've resolved that from now on my burden bearers will get their lump of sugar early enough in life so that I will enjoy giving it to them when they are down and out. A Farmer.

Corn Year After Year

I RECENTLY noticed a reply to an inquiry regarding the growing of shagreen corn, both articles being printed in the Pennsylvania Farmer.

IT'S A FUNNY THING that cheap paint costs more than good paint

It isn't so awfully funny either—not when you are paying the bill! Cheap paint is made from cheap ingredients to keep the cost down. Its first cost may be less, but it covers less area, it looks cheap, it is not durable. The job soon needs repainting. That's why in the end cheap paint costs more than good paint. Felton-Sibley paint is good paint and is sold by reliable dealers.

THE OLD ENGLISH SHEPHERD PUP. Natural head drivers, cow, sheep and watch dogs. H. G. Loucks, Vermilion, Ohio.

A Modern Dairy Barn

Agricultural Engineering

By R. U. BLASINGAME

Value of Drinking Cups

WE are told that milk is 83 per cent water. If a manufacturer was making a product which was 86 per cent water the first thing he would do would be to put in an adequate water supply. Water is one of the cheapest things to obtain around a farm. Nature supplies it in abundance, but it has to be piped to the place where it is used. It is not anything like as expensive as wheat, oats or corn; yet farmers do not think of trying to do without the machinery to produce these products and the power to operate it. The binder is used only a few days a year. A water system is in operation every day and water is an absolute essential to both man and lower animals.

Drinking Cup Requirements

This method of supplying water to dairy cows is automatic and the cow can drink whenever she cares to. This means that she will drink more water than when she is driven to the spring or creek once or twice per day. Also water piped from the well or cistern is about ground temperature, which is possibly around 48 to 60 degrees Fahrenheit. With the pneumatic or pressure system the tank is usually located in the basement of some building where it is kept from freezing. The pipes run under ground and then through the barn which, as a rule, is above freezing. Moderately warm water does not chill the cow's system, therefore less feed is required to bring the water she drinks up to body temperature.

Water Pressure Required

One manufacturer says that his drinking cups will work under three pounds of pressure and up to 30 pounds per square inch. If the water pressure is beyond 30 pounds then it is best to use a pressure regulator.

Now about water pressure. Every foot of head (or height) of water will give a pressure of .434 pounds per square inch. Saying it another way, water standing in a pipe 2.3 feet high will give one pound of pressure for each square inch. Therefore, to secure three pounds pressure the water must have a head of about seven feet. No doubt the reason the drinking cup is designated for a maximum of 30 pounds water pressure is because most of the automatic electric water systems work under that pressure. In fact they cut out at 30 pounds. This pressure is equal to a water tank about 92 feet high.

Also the engine driven pneumatic water systems usually work under 30 pounds maximum pressure.

The automatic cutout device on electric water systems works on the

same principle as the air system at the garage for inflating automobile tires.

But no matter what water system you can secure, remember that milk is 86 per cent water and a cow cannot produce a full flow of milk without it.

New Dairy Buildings

I HAD the privilege of spending a day recently in Frederick county, Maryland. The chief reason for visiting this section was to see the new dairy buildings which are becoming so common through the country.

It is not uncommon to see both a new dairy barn and a milk house close by built of concrete blocks. The accompanying illustration shows the new dairy barn and one corner of the milk house which has just been built by Mr. Frank Stauffer, just out of Frederick, Maryland.

The milk house is 24 x 12 feet. It is divided into three rooms. One room contains the boiler and has a solid partition separating it from the other part of the milk house. It measures 12 x 3 feet 6 inches.

The next room has two windows, a sink and a galvanized iron sterilizer in which Mr. Stauffer sterilizes his milk cans and other utensils. He places the cans in the sterilizer upside down and when he is through steaming them the doors of the sterilizer are kept closed and the heat from the steam causes the cans to dry thoroughly.

The bacteriologists tell us that very few germs can live in the presence of steam and especially when the steamed vessels are thoroughly dried after steaming. Bacteria, it seems, require a certain amount of moisture and cannot live long when perfectly dry. The sterilizer room is 11 x 12 feet and has a drain in the center of the concrete floor.

The next room in the milk house, which is closest to the barn, contains a cork insulated concrete tank and the surface cooler. The milk is brought from the barn into this room, passed over the surface cooler and the 10-gallon cans placed immediately in the cork insulated vat. This milk room is equipped with screens, for both windows and doors.

With this equipment Mr. Stauffer has a score under the Washington, D. C., milk regulations of 97 per cent. The barn measures 36 x 70 feet and holds 32 cows. The hay is dropped from mow through chutes to the ground floor. Doors are provided on the chutes to exclude the dust from the barn. To the right as one enters the barn is a small room with clean towels and a washbowl provide ample opportunity for cleanliness before milking.

AGENTS

ARE YOU MAKING ENOUGH MONEY?—Great us show you how to increase your income. We show you how to do as others have done. We show you how to make big money. Our good work recently Johnson made \$17,135. In one year \$147,001. Hale, \$58,100; Chamberlain, \$26,000. Experience not necessary. We tell you how to make money with the right kind of service to the host of stock. Write today—it will pay you. Radio Program

A WEEK full of the most important agricultural news is in store for radio listeners during the last week in January. From Monday, January 27, to Thursday, January 30, members of the National Farm and Home Hour family who hear the U. S. Department of Agriculture over the NBC from 11:45 a. m. to 12:30 p. m., Central Standard time, will hear of the prospects in their particular lines for 1930.

Full Hour January 27

Stations which regularly broadcast the Farm and Home Hour on the Pacific Coast on Saturdays will also broadcast the agricultural outlook program on January 27. Instead of the usual 45-minute program, a full hour will be devoted to the first of the outlook programs on that day.

Farm Board on January 31

On Friday, January 31, the Federal Farm Board will again take the air with a program designed to keep farmers and others interested in agriculture abreast of its activities.

The complete program for the week of the Department of Agriculture and the Federal Farm Board speakers follows:

Monday, January 27

Annual Agricultural Outlook program.

Tuesday, January 28

The Wheat Outlook, O. C. Stine. The Cotton Outlook, A. W. Palmer. The Tobacco Outlook, C. E. Gage. The Feed Grains Outlook, J. A. Becker.

Wednesday, January 29

The Dairy Outlook, C. L. Holmes. The Beef Cattle Outlook, C. E. Gibbons. The Hog Outlook, C. A. Burmeister. The Sheep Outlook, C. L. Harlan.

Thursday, January 30

The Potato Outlook, J. B. Shepard. The Fruit Outlook, F. G. Robb. The Early Vegetable Outlook, Paul Koehn. The Poultry and Egg Outlook, Roy C. Potts.

Friday, January 31

The Household Calendar, Rowena Schmidt Carpenter.

The Federal Farm Board program.

Saturday, February 1.

Four-H Club program.

IN opening the annual agricultural outlook reports, January 27, Chairman Legge of the Federal Farm Board will head the program with a talk emphasizing the need of control of production in orderly marketing. Secretary of Agriculture Hyde will conclude with an appeal for control of production and the use of economic information in bringing this about. N. A. Olsen, Chief of the Bureau of Agricultural Economics, will preside and the U. S. Marine Band will furnish music.

UNLOCK THE STOREHOUSE OF PLANT FOOD IN YOUR SOIL with a Good Disk Harrow

Locked in the soil is a veritable storehouse of plant food waiting to be released for the benefit of your crops. A John Deere Disk Harrow is the master key that unlocks the buried treasure, pen-

etrating the hard, weedy or stubbled surface, pulverizing the lumps of plowed ground, mixing the soil and making available plant food so necessary in the growing of your crops.

**It's Strong
and
Flexible**

**Use the
JOHN DEERE
Model B**

For nearly half a century the John Deere Model B Disk Harrow has been helping thousands of farmers to greater profits through its superior performance. In uneven fields where flexibility is essential to even penetration, the Model B is supreme.

The pivoted yoke controlled by

powerful pressure spring and third lever allows one gang to rise over an obstruction without affecting the work of the other gang.

Tractor harrow strength is built into the Model B. It can be quickly converted into a double-action disk harrow by adding a rear section which we can furnish.

John Deere Model L
Tractor Disk
Harrow.

Two Diskings in One Trip

After the John Deere Model L has been over your field you'll find a real job of double diskings. The soil is worked thoroughly the full width of the harrow, every trip.

The famous John Deere Yielding Lock Coupling keeps the rear disks in proper alignment so they

cut out ridges left by the front disks.

Oscillating scrapers and double-bar riveted gang frames are new improvements.

Remember, all John Deere Disk Harrows have long-wearing, heat-treated Alloy Steel Disks.

See your John Deere dealer. Write for folder describing the machine in which you are interested. Write to John Deere, Moline, Illinois, and ask for Booklet—B1-026.

JOHN DEERE

THE TRADE MARK OF QUALITY MADE FAMOUS BY GOOD IMPLEMENTS

More Orchard and Vegetable Profits in 1930

Farm Facts and Fancies

By ALVA AGEE

I LAY no claim to a fixed judgment about future events. It is one's privilege to be slightly optimistic at times and just as much pessimistic at others. The present attempt of this government to exercise some control over the price of the present wheat crop is one of the most interesting ventures we ever have made in our farm economics world. If there was to be a demonstration in the attempted control that has been so earnestly advocated for years, this crop year was the opportune time. There was less wheat for shipment from the southern hemisphere, and Canada was of a like mind with us in withholding grain until Europe would become ready to bid up.

It seemed to me due to a great mass of believers in price control that the effort be made in accordance with the intent of the law that was enacted by a majority of our law makers. Our government is based on the rule of the majority, and while we may be far from arriving at the judgment of the mass of people we must accept the acts of a majority as representative. Everything led up to an attempted demonstration of our power to control wheat prices. This was the year for that.

IF a great world surplus of wheat were on hand this year, and if Canada had been inclined to pursue its usual policy of rushing its wheat to market before the lakes were closed with ice, an attempt on our part to control wheat prices would certainly have been ill-timed. So far as I can see this year was made to order for those who paved the way for the creation of the Farm Marketing Board and the provision for its activities. If a winning cannot be made this year, quite possibly it never can.

WITHIN the last ten years we have had two other notable efforts of countries to control the prices of two products. The colonies of Great Britain were producing nearly three-fourths of all the world's rubber, and prices were put upon a high level. The result was that the production of rubber in other countries was stimulated, means of using old rubber were devised, and the situation of the producers in British colonies became so bad that the attempt was abandoned.

Then Brazil tried it with coffee. Within a few years the new plantations that had been made in view of the high price of coffee added so much to production that the Brazilian crop alone exceeded the entire world's demands by 25 per cent, and new plantings in other producing countries are coming into bearing. The result is a breakdown in the scheme, the price of coffee has dropped nearly a half from the year's high, and I see by the morning's paper that it continues to break. Production was unduly stimulated.

THE Marketing Board is trying to influence the growers of spring wheat in this country not to expand area, and growers are told that the high loaning price made on the present crop has no application to next fall's crop. The effort is good so far as it goes, but even if acreage is held down to normal in our spring wheat region, I am wondering what Canada will do, and she has nearly unlimited capacity for expansion.

However, the immediate problem is the price to be got for the wheat on hand the crop of 1929-30. One watches the papers to see whether Europe is about to bid up on wheat to meet her immediate needs in the first half of this year. Our best official authorities claim that she must draw heavily upon the reserves now held by Canada and this country. If

they are right, our first national venture in price control can turn out a success.

If the Russian Soviet is compelled to export wheat to get credit, regardless of her people's need, and if the unusually good crops of part of Europe carry her farther than we had figured, Canada may yield and let the wheat go forward freely.

SOME writers present the view that Europe is bluffing along on home supplies, hoping to weaken confidence here and in Canada. That seems to me a foolish view. The fact is that some of the keenest minds in this and other countries are engaged in speculation in grain. They have nearly unlimited resources. The ones who expect to see higher prices buy wheat for delivery in some future month. The ones who expect to see lower prices sell wheat for future delivery.

There is no sentiment in the matter, but only hard-headed desire to guess right and make money. It results that the prices of futures register the composite judgment of a host of skilled investors and speculators.

GRANTING that something may happen any day to cause Europe to begin to take our wheat freely at an advancing price, if this does not come about within the next two months one wonders whether Canada does not have an advantage over this country. It knows that we are committed to the present effort, and have loaned money up near market price—evidently exceeding it one day. It isn't in the nature of things that our board or farmers will throw up the sponge during this crop year, but will see the matter through.

We shall stay by this first attempt to control prices, and one wonders whether Canada may not be quicker to supply wheat if Europe manages to get along without bidding up prices very materially. This thought may have no particular value, but Canada seems to me to have a big advantage in that we are definitely committed to this venture for this year, while she can unload some wheat when it seems wise to her.

IF Europe's need is as great and as immediate as some figure it to be, we are bound to win. Even so, it will be due to demand in relation to supply. The experience can prove only that when demand is close to supply prices go up, and provision for growers to hold for the rise works out for their good. When we have a considerable world surplus the problem is very different, and all the time we have the puzzle of holding production down when profits increase.

Quality and Prices

ONE Ohio county, when its sheep growers got tired of the prices they had been receiving, proceeded to investigate. One-fourth of the county's agricultural income was derived from sheep, of which there were 48,000 head in the county. Less than 60 per cent of the lambs marketed from the county were topping the market.

Under the analysis of the marketing specialist it was found that the poor returns to sheep raisers were due to lack of thrift in the lambs, which were usually infested with stomach worms or other parasites, to poor feeding or inferior breeding, or to inability of the producer to tell when his lambs were fat enough for market.

THE COVER THIS WEEK

IN the day of the Conestoga wagon the National Pike was the main artery of commerce between the Atlantic Seaboard and the region west of the Alleghenies. Our cover this week shows one of the few surviving toll gates on this route. This one is located at West Alexander, Pa.

To Make a Rock Garden

Would you be so kind as to give me information about making a rock garden? What kind of flowers are suitable? How big should the rocks be? Also is it too late to make one? The garden is about four feet wide and 25 feet long.
E. B. H.

BEFORE a definite answer could be made to the question above one must know something about the topography and vegetation of the area where the garden is to be placed. If the area is sloping or even hilly and it would offer an ideal setting for developing such a garden. If, however, the property is perfectly level and a bed is to be cut out of lawn (4 by 25 feet) one is not advised in attempting such a project. A development would be incongruous and spoil the peacefulness of general development which you have. In other words, it would mar landscape design.

One might be justified in attempting a rock garden if the proposed garden abutted a heavily wooded or an old stone wall. Rock gardens have been developed very successfully around the foundation of an barn. A natural environment or proper "motif" then is necessary or one should attempt a rock garden.

Assuming that a setting justifying developing of a rock garden exists, I would introduce rocks of various sizes and shapes; one might use an exposed surface of three or four feet, a few with one and a square foot and the others with one square foot. Thirteen to fifteen stones scattered over the area as you have specified would be right. They should be grouped and there to form pockets in which plants can be placed and they should have two-thirds of their bulk underground to prevent heaving during the winter.

All low growing plants may be used for many, such as Creeping Thyme (Lysimachia) and deadnettle (Lamium) are rampant in habit of growth and smother out the more delicate and more beautiful types. In order to maintain a typical rock garden, plants should be chosen which are in harmony with the spirit of the garden. Many rock gardens are filled with common Sweet Williams, larkspurs, Phlox, Hollyhocks and annuals, which belong to a different type of garden.

The following list of perennials in plants which either possess a fine texture foliage or are very low growing plants which do well in confined areas:

Chilsea bottle de neige (Ball of Snow); Alyssum argentea (Silverwort); Alyssum saxatile compactum (Golden Tuft); Anemone pennsylvanica (Canadian Windflower); Anemone canadensis (American Columbine); Arabis alpina (Rock cress); Campanula carpatia (Carpathian Bell); Centaurea montana (Mountain Blue); Cerastium tomentosum (White in Summer); Dianthus deltoides (Maiden Pink); Dianthus plumarius (Scotch Pink); Dianthus eximius (Wild Bleeding Heart); Geranium sanguineum (Coral Bells); Heuchera brizoides (Coral Bells); Iberis sempervirens (Evergreen candytuft); Linaria cristata (Crested Iris); Linaria (Kenilworth Ivy); Linum catharticum (Perennial Flax); Lysichiton (Spatterdock); Lysichiton (Spatterdock); Primula veris (English Primrose); Saponaria ocyroides (Soapwort); Sedum in variety (Cups); Stokesia caryanensis (Aster); Thalictrum aquilegifolium (Meadow rue); Tunicia saxifraga (Saxifrage like Thyme); Veronica (Hoary Speedwell); Veronica (Creeping Speedwell); Veronica spicata (Speedwell); Viola Minor (Periwinkle); Viola in variety (Pansies).
E. J. Wilde.

Farm homes that are castles

You can tell the farm home which is a castle in the proper sense of the word. Not a mansion to be sure. But always imposing, impressive. Large, sunshiny rooms in the midst of broad acres and open fields. Expanse of ground, fresh country air. Neat trimmings and landscaping which add dignity to the house.

You know before you enter that the owner has a certain soundness of thinking usually called business sense. Always on guard against waste. And usually the housewife tells you that thrift—care and scrutiny at the time of buying—bought those extras which make the inside seem so complete. For, she adds, they read the advertisements.

It pays to read advertising

Reading the advertisements tells you what to buy and how to get most value for every penny spent. A dozen needs arise on your farm every week. Knowing which machine which tools, which automobile, which suite of furniture, which cooking fuel is the best for the price you pay, will save money otherwise thrown away. Perhaps as little as twenty-five cents a week—perhaps a hundred dollars a single purchase.

You can beautify your home—make a real castle out of it—with money saved in buying advertised goods. When you buy merchandise advertised by name, you get purchase value in the greatest degree from every dollar spent.

NO NATIONAL POTATO PLAN

THE National Potato Institute, which met recently in Chicago to consider the problems of producers, decided that potato growers could not work with the Federal Farm Board because it requires that a single national cooperative organization shall handle each commodity. The potato growers will therefore try to work out other plans, each adapted to the region in which it is to operate.

FUTURE SHOWS

AFTER much discussion of the future of the Farm Products Show at Harrisburg last week the conclusion is that it will be held at the usual time in 1931 and that it will continue as now free to the public. No official conclusion has been reached, but it is likely to be as just stated. The next thing to consider is the possibility of an autumn livestock and fatstock show, including evening horse shows. This would certainly be popular and would probably be successful from a financial as well as an educational standpoint.

LOWER AT LONDON

AT the opening of the London wool auctions last week merino wools sold about 15 per cent and crossbred wools 20@25 per cent below the prices realized at the December sales. The offering was large, 164,500 bales, and the demand not in consonance with the supply. The decline was greater than generally expected, though a slight improvement came later. What effect this will have on our market remains to be seen, but certainly it cannot be favorable. The London sales are the best possible reflection of the world's wool situation, being open to the sellers and the buyers of all continents. Our wool situation is different and will be as long as we produce less than we use and maintain a tariff on it.

WE VENTURE TO SUGGEST

THERE are some things which indicate that the problem of rural electrification may get into politics. Before it gets there we want to make one brief statement and one suggestion. This matter is being handled properly now, by the cooperation of farmers and utilities in their Joint Committee. It cannot be so well handled by politicians, particularly by those who fail to recognize the financial problem involved in extensions. For unless the companies can secure credit they cannot make the extensions rural service requires, and they cannot secure credit unless they are able to show that extensions may ultimately earn something. No amount of legislation on rates will furnish money for extensions that do not promise earnings. The Joint Committee—both parts of it—is working hard to reduce costs and consequently

initial rates. The Joint Committee is striving to increase the use of current so that the users may enjoy lower rates. Our suggestion to farmers is to leave their cause in the hands of this Joint Committee rather than in the hands of politicians, no matter how attractive the promises of the latter may be. Rural electrification got nowhere until the Joint Committee went to work on it. And that is where it will get it if it gets into politics.

A PAIR OF HERETICS

THE Commissioner of Agriculture of Minnesota thinks that the Federal Farm Board is unduly alarmed over the prospective spring wheat acreage. He says, "We know that production and price have a relationship to each other, but to try to control production may prove dangerous. Operating farms is not like running a factory." The chairman of the Minnesota railroad and warehouse commission says: "It may be that I belong to the old school; but I have always felt, and see no reason now for changing my mind, that the farmer is the best judge of how much grain he should sow of the various kinds." What should be done with these and other hard-shell heretics who don't, won't or can't subscribe to the modern doctrine that some commission or board should regulate production, marketing and everything else?

UNLESS AND UNLESS!

OUR friends the outlookers have been busy at Washington of late and they are now releasing the results of their cogitations and consultations. As to wheat they say: "There is little in the wheat situation in the United States and other countries at present to indicate that prices for the 1930 crop of the United States will be much different from those prevailing for the 1929 crop—unless fall-sown wheat suffers severe winter damage or (unless) the spring wheat acreage is reduced." Reading further we find that "unless adverse conditions develop between now and harvest time another large crop of winter wheat will be produced in 1930." And still further as to spring wheat "Any expansion would probably result in lower prices, if average or better than average yields are obtained, unless the protein content of hard winter wheat is lower than in 1929." Turning to Russia the outlookers find that there isn't much "likelihood that Russia will be in position to export appreciable quantities next year unless the yield is high." We venture to add that the outlookers will find that they are right in all their statements—unless they are wrong.

MOTH PROOF

LAST week the American Woolen Company, the largest producer of wool fabrics, announced its prices for staple fall suitings, and they are practically the same as last year. The public will be less interested in this than in the accompanying announcement that these cloths are guaranteed to be moth-proof. If we are not mistaken this is the first guarantee of the kind ever made by a reputable manufacturer of wool fabrics. With the guaranty goes the statement that the treatment which protects against moth does not injure the cloth in construction, appearance or other respects. This discovery, if it proves its worth, may have a more important bearing on the use of wool fabrics than we now realize.

FROM LIFE

LATE last year a certain man was sold out by the sheriff, to the surprise of many who did not know his circumstances. For he had always lived as a man of wealth and leisure. The trouble was that as a boy he was never taught or made to work. It was known that he would have much revenue-producing

property when he came of age and so would not need to work. At any rate he never tackled anything seriously except sports, in several lines of which he became rather proficient. His property gradually dwindled until now he has nothing and can do nothing for himself. Those who "spoiled" him in youth may be responsible in part, but he has known for years that he could not go on indefinitely spending more than his income. Those who worry because their children have to work might learn something from this little sketch.

FATAL BULLS

THIS week we must record two more fatal assaults by bulls. January 18th Sigmund Sasnowski, an employe of Paul McGraw, Wayne county, Pa., went into the stall of a dehorned four-year-old Guernsey bull for the purpose of leading it to water. The bull suddenly attacked him and crushed him so that he died within half an hour. The collier dog which accompanied Mr. Sasnowski went to his rescue and allowed him to get out of the bull's stall, but even the dog's prompt counter-attack was too late. The victim in this case had been warned against going alone to the bull's stall but had always replied that he was not afraid. January 16th Michael Balchies, of Larksville, Luzerne county, Pa., was found dead in the stall of a bull in the barn of Julius Martin, his body terribly mangled. Nobody witnessed this attack and it is supposed that Mr. Balchies entered the bull stall by mistake, as he was not helping to care for the cattle.

The above and the two following cases are reported by friends who urge us to continue these warnings. William Kickamp of Litchfield, Ill., was seriously injured by his bull on Wednesday of last week. His dog, breed not stated, ran to a neighbor's house and barked until it got the neighbor to follow to the bull's lot, where he found Mr. Kickamp unconscious in the snow. Does a dog think in another case a convenient tree saved the life of the man who entered the bull's paddock. He is thankful for the tree but not impressed by its comfort in cold weather, for the bull kept him in the branches for over an hour. Four cases this week, and doubtless we hear about only a few of them. How long would our list be if we got them all?

SAME OLD PROBLEMS

WE have just gone over a couple of discussions at a meeting of a farmers' organization, and they seemed rather familiar in several ways. One speaker observed that they had all realized long ago that the only people who know how to farm are those who are not farming. The competition of foreign products was brought out and the assistance of the government was demanded in handling the problem. Two speakers discussed the government's part—one saying that it could and would do nothing and the other urging farmers to formulate a policy which the government could adopt. But, like many orators, he failed to specify what that policy should be. Then both discussions drifted into various essentials of successful farming—proved blood, better machinery, soil fertility, reduction of costs of production, etc. Let us add, before we forget it, that these meetings were held not in the United States but in England.

IN THE CENSUS

IN the census of 1930 farmers will be asked for a greater variety of information than any earlier census. In fact so much is included in the farm schedule that taking the census will be a big job this time. We can all help by giving the enumerators careful records and estimates. Let us try to do our part to assist our benevolent Uncle Sam to get and to give the world complete agricultural information.

January 1, 1930

Penn'a State Farm Products Show

Keystone Agriculture Stages Mid-Winter Round-Up

THE annual Farm Products Show and the annual meetings of twenty-eight state organizations drew thousands of farmers to Harrisburg last week—how many thousands no one knows, for the shows and meetings were so scattered and no check could be kept on attendance. The crowds were large everywhere, exhibits and at meetings and banquets.

There was general satisfaction over the fact that this was the last year when such "scattering" of exhibits and meetings will be necessary. Before next show the new building will be ready, everybody may see everything on the nine acres it will cover. Prevailing sentiment favors having these events in January and favors the show rather than even a moderate addition fee; but the arguments of stockmen for earlier show should be given proper consideration in the hope that we may have a great livestock and fat stock show as well as a mid-winter round-up.

It is hard to summarize in a paragraph the most discussed by farmers. One of the topics of informal discussion was taxation and its effect on land values. A study of the situation from the farmer's standpoint is one of the coming events in this state. The extension of electricity to the farms is another topic of interest and growing interest. But Pennsylvania farmers are more interested in production than any other single topic—for they have good facts and economical production is essential success.

Members of the Federal Farm Board are on programs during the week. They could offer much that was attractive to Pennsylvania producers except cheap money, and that is available except to cooperative organizations. They left the impression that the Board is a big job on its hands and its members are it.

There was heard of deer damage than in recent years. The road problem is still unsolved, those not located on main highways and they do not know what and when. There is no opinion to the policies whereby the state and sportsmen are acquiring lands not suited to agriculture.

Agricultural education and extension are more needed than ever before. Warnings were sounded that as competing farmers become better organized in other regions our farmers must become more competent on marketing, but continue in ability to compete with distant products was expressed also.

Entries Largest on Record

Thirty-three fruit growers from twelve counties exhibited this year. The fruit was of unusual good quality, considering the rather unfavorable season for the crop during 1929.

Over 200 entries were reported in the potato contest with the quality better than in the previous show. The number of entries was slightly larger than a year ago. Seventy exhibits were held by 400-Bushel Club members.

The hundred and five fleeces made up the wool exhibit, which was twice as large as the 1929 show. The show included 35 bred Duroc-Jersey, Shire, Chester White and Poland-China sows. There were 200 entries of canned goods, jellies, dry products and garments. Since this is only the second year for the home economics display, enormous growth of interest in this feature is indicated.

The corn show consisted of 508 ten-ear entries and 50 single ear entries. This is a slightly larger show than a year previous.

The hundred and forty entries made up the dry display. Twenty entries made up the maple syrup exhibit. Fifty-one single entries and 11 cup displays made up the vegetable exhibits. This is twice the size of the 1929 show.

Twenty-two entries of wheat, buckwheat, rye, timothy seed and soy beans made up the display of small grains. This exhibit is one-third larger than the previous show.

The poultry exhibit was the largest in the history of the show. Over 1,400 birds were entered, of which were turkeys.

Kings and Queens

Two years ago Secretary Jordan began tentatively the general Tuesday evening meeting of the week the honoring of outstanding farmers from the state from the standpoint of production, showing the same custom this year special recognition was given to H. A. Snyder of Montoursville, Lycoming county, as the man having accomplished an outstanding record in dairying. For two successive years Mr. Snyder has succeeded in keeping the average production of his herd above 500 pounds of butterfat, the only dairy herd in this state to have accomplished this feat two years in succession.

G. C. Birdsall of Susquehanna county was given special recognition for having produced the largest litter of pigs at six months of age ever recorded in this state. A litter of 17 pigs farrowed last spring on his farm weighed at the 180-day mark 3,987 pounds, or almost two tons.

The potato king for 1929 was Henry Y. High of Bucks county who had the highest acre yield of spuds for the year, the yield being 629.4 bushels.

To Mrs. Florence Lohr Johnson of Boswell, Somerset county, recognition was given for her outstanding work in the line of raising turkeys. The flock of her father's farm, of which she took charge, had almost 3,000 turkeys in 1929, and was one of the largest flocks in the eastern half of the United States.

Besides honoring these folks for their fine accomplishments the program of this general meeting consisted of an address by Congressman John C. Ketcham of Michigan, who spoke on "What We May Expect of the Federal Farm Board." Short addresses were given by Dean R. L. Watts of State College and Lindlay Dennis of the Department of Vocational Education at Harrisburg. Entertaining features were rendered by members of the vocational teaching staff.

Council of Farm Organizations

The predominating sentiment expressed at the meeting of the State Council of Farm Organizations held Thursday afternoon, January 23, was in favor of continuing the Farm Products Show in January. Some of the livestock organizations endorsed the idea of working out a livestock show for the fall season if conditions faced by the Show Commission warrant this procedure. Other matters of discussion included Rural Electrification, Taxation, Casualty Insurance, Appropriations for State College and Game Regulations.

A committee of the Council has been working for three years with a committee representing the Pennsylvania Electrical Association, the two committees being known as the Pennsylvania Joint Committee on Rural Electrification. The report of the Council committee on this new development was very encouraging.

The Taxation Committee reported having taken a very active part in legislative discussions during the last Legislative Assembly, especially on bills pertaining to license fees or gas tax. This Committee is working on a program of crystallizing rural sentiment in an effort actually to find out what the tax situation is in Pennsylvania, and, as will be evident, the working out of a program that will more nearly equalize taxation.

The officers of the Council, which is composed of three representatives from every state-wide farm organization in the state were all reelected for the coming year. They are: H. D. Allebach, president; John H. Light, vice-president; Miles Horst, secretary-treasurer, and the two additional members of the Executive Committee, C. J. Tyson and F. P. Willis.

Society of Farm Women

Mrs. J. R. Cassel of Lancaster county was re-elected president of the Society of Farm Women of Pennsylvania for the coming year. Mrs. David Reese of Pittsburgh was elected vice-president. Mrs. Harrison Nolt of Lancaster county as secretary, and Mrs. Sam Mohler of Lancaster county, treasurer.

On Tuesday and Wednesday of last week the Society held one of its best attended and most interesting meetings seen at Harrisburg for a number of years. Addresses were interspersed with features of entertainment while a banquet held Tuesday evening brought these women, and those interested in their work, together in a social way.

Addresses were made by Dr. C. G. Jordan, Secretary of Agriculture; J. S. Illick of the State Department of Forests, who spoke on "Farm's Woods," Mrs. Charles Seydell, of Chicago, who spoke on "Farm Women's Contribution to Organized Agriculture," and Miss Grace Barr of Camden, N. J., who spoke on "Music Appreciation in the Home." Miss Anna McDonald, Assistant State Librarian, emphasized the great need for establishing more county libraries throughout the state; Rural Electrification and its problems was discussed by John

M. McKee, executive secretary of the Pennsylvania Joint Committee on Rural Electrification.

Vocational Boys and Girls Win Scholarships

The six \$100 scholarships offered by the State Farm Products Show Commission to six students of Vocational High Schools in the state winning in the annual demonstration contests staged during the Show were as follows: David Warfield, York county; Jos. Greubel, Westmoreland county; Charles Curry, Lebanon county; Frank Shannon, Perry county; Emily Erickson, Westmoreland county, and Mildred Robacker of Wayne county.

While these four boys and two girls took the scholarships, many awards were made during the vocational gathering of 750 vocational boys and girls to winners of the many different projects carried on in vocational schools throughout the state.

In addition to these individual honors different schools competed with one another. Winners among these teams were as follows: 1, Blain vocational school, Perry county. 2, York county vocational school. 3, Edinboro school, Erie county. 4, Derry township school, Westmoreland county. 5, Morrison Cove vocational school, Blair county. 6, Jonestown high school, Lebanon county. 7, St. Thomas vocational school, Franklin county. 8, Robinson township, Allegheny county. 9, Port Allegany, McKean county. 10, Shippensburg high school, Cumberland county.

The winning teams in the home economics demonstration were: 1, West Newton high school, Westmoreland county. 2, Beaver Joint vocational school. 3, Morrison Cove vocational school, Blair county. 4, Green Dreher Joint vocational school, Wayne county.

A 13-Year-Old Girl Champion

Youth asserted itself in the potato show. Mary C. Werner of Bath, Northampton county, not only won the championship among the exhibits in the boys and girls classes but she came through with the grand champion ribbon for the entire potato show consisting of about 300 exhibits. Mary has been growing potatoes for two years as a part of her 4-H Club work. She is a member of the Northampton County Potato Club, consisting of 27 members.

Rural Electrification

The Pennsylvania Joint Committee on Rural Electrification in cooperation with electrical manufacturers staged one of the largest exhibits at the Show featuring electrical equipment for the household.

One of the appliances attracting the most interest was the electric range. Apparently the rural people are coming to understand that with promotional rates offered whereby in most cases current can be purchased for 3c to 4c per K. W. H. for cooking that the electric range is an economical appliance, when the feature of labor-saving and convenience is added to that of the fine quality of foods cooked in this manner. Prices ranged from about \$130 to \$300 depending on the size and finish of the range.

The electric mangle iron also received a great deal of attention from the rural folk for this is one of the heavy duty labor jobs on the farm today. With current figured at 2c to 4c per K. W. H. the cost of operation is comparatively low while the price of this equipment has been much reduced.

The vacuum sweeper, washer, refrigerator and radio did not attract the attention of previous years. Apparently the people are much more familiar with these pieces of equipment and consequently have less questions to ask. Probably no electrical appliance has met with more general favor and achieved the general public recognition so rapidly as the electric refrigerators. Most households find they will average about 40 or 50 K. W. H. of current per month, consequently, resulting in a bill of less than \$2, figuring on the low block of current.

Waffle irons, bread irons, hair curlers, water heaters, radiant heaters, etc., were shown in a most beautiful non-traditional finish but did not receive much attention unless being demonstrated.

At the headquarters booth of the Joint Committee on Rural Electrification, home service demonstrators made coffee, waffles and toast with electrical appliances and handed out samples to those passing by. The response the samples met would seem to indicate that Pennsylvania's farm people like the electrically-cooked foods.

The requests for information as to conditions under which electric service would be extended

were very limited. A distinct change from three years ago when there were a large number of questions of this nature.

The Pennsylvania State College in cooperation with the Joint Committee conducted a feed grinding demonstration using 5 and 7 1/2 h. p. motors with both burr and hammer mills. Those desiring detailed information in this connection should write the Farm Machinery Department of the College for a "Progress Report on the Use of Small Electric Motors for Cutting Fodder, Saving Wood, Grinding Feed."

The application of electricity to farm and household work was in evidence at every point. Practically all stationary equipment was shown for operation with electric motor attachment. Several dairy refrigeration units were of particular interest to the dairymen also the electrically operated milking machines. One could not leave the show without being impressed with the fact that electricity has come to play an important part on the farm.

Over 30,000 Farm Users

The Rural Electrification Exhibit was made possible through the cooperation of the Pennsylvania Joint Committee on Rural Electrification, manufacturers of electric equipment and the Farm Products Show Commission. With over 122,000 customers on rural lines in Pennsylvania of which over 30,000 are farm users and with many more thousand desiring electric service, the problems of rural electrification continue to be of major interest. Persons desiring any information in this connection should communicate with the above Committee, Room 707, Telegraph Building, Harrisburg, and also confer with their local electric light company.

The program of the potato growers was limited this year to two half-day sessions and a banquet. An average attendance of 650 at the two half-day sessions and of 400 at the banquet tells the story of the interest of the potato growers in their meeting.

H. R. Talmage, president of the Long Island Potato Growers' Association, led the marketing discussions on Wednesday afternoon. These dis-

cussions went beyond questions of standardization and grading to problems of meeting the new conditions created by the large scale buying by chain stores. The statement was made that nearby markets may not be as big an advantage to local producers as we sometimes think, not because freight hauls are in their favor but rather that outlying producing sections, because of this advantage, are compelled to produce a better package and better quality, which in the end will bring enough premium over local stuff to pay for the longer freight hauls. The Association appointed a Marketing Committee to work out a program of bringing our good Pennsylvania potatoes to the attention of more Pennsylvania consumers.

At the banquet, which was held in one of the local churches, music, fun and an able address by E. S. Fayard were the outstanding features of the occasion. At this banquet 21 growers received medals for having made the 400-Bushel Club this year for the first time. These medals are awarded annually to all growers who accomplished this feat for the first time. It was reported that the total number of 400-bushel potato growers in the state in 1929 was 81.

Open Discussion

The second half day session, with Dr. E. L. Nixon presiding, was devoted to problems of production and included a summary of the practices followed on the acres making the 400-bushel yield this year. This session, like the former, was one of open discussion in which any man in the audience could ask a question and direct it to any other in the group.

The officers elected for the ensuing year are: R. W. Lohr, president; John Shrope, vice-president; Miles Horst, secretary-treasurer; L. T. Denniston, assistant secretary-treasurer. These with the following men form the Board of Directors of the Association: Wm. H. Mendenhall, Reuben Ringer, John B. Campbell, Robert Getz, Harold Dunn, Charles Beaver, Levi Brubaker.

Vegetable Growers' Meetings

ACHALLENGE! Again the growers from the Philadelphia district have carried home the lion's share of prizes. A well-deserved share, too, for the display included a remarkable collection of extremely high-class produce. Just credit to the Quaker City growers and a challenge to all up-state growers who did not exhibit this year.

In the keen competition in the "Display" class, Wm. G. Wenker, N. M. Comly Sons and H. N. Dudley and Sons, all of Bustleton, placed in the order given. Other prominent names in the list of winners are: A. H. Mende & Sons, Bristol; Andrew Gersch, Bustleton; G. E. Smith, Bethlehem; Yeagle Bros., Bristol; S. Q. Becker, Bristol; E. W. Palzer, Torresdale; A. D. Alburger, Bustleton; F. J. Dempsey, Bustleton; Wm. Stoker, Byberry; L. R. Downing, Downingtown.

In the marketing session W. R. Whitacre of the Bureau of Markets explained how produce market information is secured by field representatives, who daily circulate among the buyers and sellers at the large markets.

C. M. Smith of Lewistown, grower, told how he has developed a great trade in fancy tomatoes packed in 12-quart Climax baskets, bearing his own lithographed label. Mr. Smith is building business in spite of the competition from the west and south.

County Agent H. R. Ely of Allegheny county called attention to the effectiveness of attractive packages and labels, and of genuinely attractive vegetables, in making sales. Studies have revealed that over 85 per cent of all vegetables sold are finally purchased by women, a fact that places additional premium on attractiveness.

Mr. Horace Greener, Philadelphia commission merchant, emphasized the supreme importance of labeling everything we sell. He told how sweet

corn, bearing simple tags with the growers' names, brought 50 cents more per bag.

"I cannot think of a more important thing for a Pennsylvania vegetable grower to do today than to be right here in this meeting session," so observed a business man from outside. Mr. De Loss Walker, who represented the National Chain Store Association.

Mr. Walker urged serious consideration of the fact that while we live in the midst of the greatest markets in the country, we are letting shipments from outside the state take an increasing proportion of the vast sums spent for fresh vegetables.

Better grading, packing, packaging and labeling, plus organization, were mentioned as deserving special attention. Mr. Walker closed: "The solution to your problems in meeting competition, of holding your markets, lies within yourselves. You will prosper or go down on the basis of your own efforts, and your efficiency in adjusting yourselves to changing conditions."

We quote from the comment that followed: "In New Jersey we have determined to meet all comers and hold our own. High yields, quality and giving the buyer what he wants and the way he wants it will be our weapons."

The feature of the Vegetable Growers' Banquet was an address by Henry C. Marquart of Orchard Park, N. Y., master farmer and president of the Vegetable Growers' Association of America. Mr. Marquart urged greater attention to organization on the part of vegetable growers; not organization to ask help from outside, but to standardize and improve our methods.

To illustrate the influence of organization, a story was told of a Negro driver who deftly flicked horse flies from the neck of his mule. When asked to take his whip and flick a

hornet that was sitting on a limb near the nest he objected, "No sah! Dat crowd am organized."

A novel feature of the session devoted to production was a "Variety Election," balloting to determine the varieties most popular with those present. Results follow:

Beans, Yellow Bush—Sure Crop, Pencil Pod, Black Wax, Yellow Bountiful.

Beans, Green Bush—Bountiful, Stringless Green Pod.

Beets—Detroit Dark Red, Crosby's Egyptian.

Cabbage, Early—Copenhagen Market, Golden Acre.

Cabbage, Late—Danish Ballhead, Penn State Ballhead.

Carrot, Early—Chantenay.

Carrot, Late—Danvers Half Long.

Celery, Early—Golden Plume.

Celery, Late—Fordhook.

Sweet Corn—Golden Bantam, Whippoorwill, Yellow, Howling Mob, Stowell's Evergreen.

Cucumber—Long Green, Davis Perfect.

Discuss Fruit Production

The State Horticulture Association of Pennsylvania divided its attention between production and marketing problems. The omnipresent insects and diseases are the bane of the grower and were roundly scored for their devastating designs, while the marketing end was attacked from the angle of improved containers, grading and cooperation.

Branding 1929 as the most chaotic year in a decade in variations from the expected life cycles of insects, Prof. H. E. Hodgkiss, extension entomologist of the Pennsylvania State College, told the Horticultural Association that the most outstanding situation came about on account of a large increase in San Jose scale. Codling moth, plum curculio, oriental fruit moth and apple maggot were other insects causing severe damages in some sections of the state.

Professor Hodgkiss reported that spraying service, built around a selected number of demonstrations, was extended last year to 3,751 apple growers in 34 counties, to 212 cherry growers and to 570 grape growers.

Most Serious Insects

Codling moth is reported by Pennsylvania growers as the most serious insect pest on apples and the Oriental fruit moth on peaches, according to a survey made by the Committee on Insect Pests, which reported its findings.

Sixteen insects were reported as serious on apples by one member. Leading among the insects which do serious damage were the codling moth, with 64 growers reporting; curculio was reported as serious by 54 growers; aphids by 63 growers; red spider by 28 growers; and red bug by 23 growers.

Eleven insects were reported as harmful to the peach crop of Pennsylvania. The Oriental fruit moth was at the head of the list, being mentioned by 73 growers. Several orchardists said the insect had just made its appearance in their orchard. Curculio was given an important place among the serious insects by 46 growers, and peach tree borers by 23 growers.

Omitting the mid-summer application of poison to apple trees gives encouragement to a group of chewing insects, including bud moths, leaf rollers, codling moth and plum curculio, said Professor H. N. Worthley. Counts of drop fruit at State College last year showed that the good results of early sprays were lost by late August where no mid-summer spray was applied.

Apple scab caused a loss of 30 per cent of the 1929 crop in Pennsylvania, according to Dr. R. S. Kirby, extension plant pathologist of State College.

Studies made in 242 orchards last year revealed that where trees received all the recommended sprays there was almost no scab and very little other disease, while in orchards unsprayed there were 87 bushels of scabby apples in every 100 bushels. Other diseases also were present.

Prudication of red cedar trees in the vicinity of apple orchards is the only satisfactory control for apple rust which has been a source of loss in southern counties, according to W. A. McCubbin, Bureau of Plant Industry,

Onions, Dry—Prizetaker, Ebenezer Peas—Thomas Laxton, Gradus Peppers—California Wonder, King, Early Giant.

Radish—Early Scarlet Globe, Red Top Giant.

Spinach—Bloomdale Savoy (early spring), Long Standing Savoy (late spring and later sowings), Virginia Resistant Savoy (fall and winter), Tomato—Bonny Best, Marglobe.

The discussions on plant growing on fertilizing vegetable crops will be reviewed next week.

The newly elected officers are: President, C. M. Smith, Lewistown; secretary-treasurer, Walter E. Nix, State College; directors, Howard A. Jersey Shore; Wm. H. B. Parksburg; H. S. Dudley, Bustleton; W. H. Evans, Plainsville; Ralph Garrahan, Forty Fort; C. L. Pittsburg; Gilbert S. Watts, Balltown; Gilbert S. Watts, Balltown.

Meeting of State Dairy Assn.

DAIRYMEN in this state are centering their attention on quality of product. If we may judge from the full program of the Pennsylvania Dairy-Association and the Pennsylvania Association of Dairy and Milk Inspectors. As usual the dairymen had a banquet, approximately 425 attending the dairy dinner Wednesday, Feb. 1, 1930. F. Schilling, member of the Federal Farm Board, was the principal speaker. Dairymen have shown real interest in their formation of cooperative marketing associations and the larger cities, he said. They proved the leaders in cooperative marketing association work, he asserted.

Eight hundred and twenty-two farm-ers in dairy herd improvement association work have received awards for their accomplishments during the past year. Announcement of these accomplishments were made at the banquet. Blue ribbons will be awarded to 79 pounds of butterfat for the past year. Blue ribbons will be given to 191 men whose herds produced between 400 and 400 pounds of butterfat last year. Red ribbons will be received by farmers whose herds produced between 300 and 350 pounds of butterfat. Last year 725 dairymen received awards in this dairy herd improvement work while five years ago 260 were thus honored.

Undulant Fever

Undulant fever, a disease of humans, which is believed to come from infected livestock, is by no means a new case, according to E. M. Harmon, associate editor of Successful Farming, of Iowa, who addressed the Pennsylvania Dairymen's Association.

No one knows how old it is," Mr. Harmon continued. "Some of our present-day scientists feel that there is reason to believe that a disease which Hippocrates described in about year 400 B. C. was undulant fever."

Regarding the alarmists' information that the disease has been a tinge of sensationalism, and combined with half-truths, has attracted much attention, the speaker asserted as an example a report that there are 50,000 cases in the United States.

As a matter of actual fact, to Jure this year, 1,296 cases have been reported in the United States over a period of seven years and five months," Harmon said. "Doubtless, there are unreported cases today, but when have to go back over a period of seven years to find 1,296 cases realize that most of these are cured by this time. It is hard to see how who values his reputation would and a guess of 50,000 cases.

One of the points which has not given sufficient attention is that pasteurization kills the organism. There is no excuse for any one trying about the contraction of the disease through drinking milk. If he pasteurized milk supply the danger is automatically eliminated. If he has not a pasteurized milk supply and has any fear of contracting the disease organisms can be destroyed by heating the milk to 140 degrees for a twenty minute period in home.

We know that this disease is the

Roast Capon

At 7 p. m. Wednesday evening the annual poultry banquet was held and was attended by over 100 poultrymen who presented, along with their tickets, a good appetite for roast capon and all the fixings.

Prof. E. M. Funk, of the Pennsylvania State College poultry department, said there was 25 per cent increase in production in Pennsylvania last year. During the past year, Pro-

source of the greatest single loss to the dairy industry. The Storrs Experiment Station has shown a loss of approximately \$44 per cow for every reacting animal whether she aborted or not. The Nebraska Station has shown losses of approximately \$100 per cow for each year that the cows lost their calves. These figures check closely as it is probably true that reacting animals abort about 40 per cent of the time. Studies by the Oregon Station check this fairly closely as do investigations on individual farms. No one knows how prevalent it is. Most estimates run above 20 per cent. If 20 per cent of our dairy cows are losing \$40 per animal the loss to the dairy industry is approximately \$175,000,000 a year. The fact that it is transmissible to humans is simply one more reason why the livestock industry of the country must come to itself and eliminate these tremendous losses.

At the business meeting the following officers were reelected: President, R. F. Brinton, West Chester; vice-president, Dr. L. M. Thompson, Montrose; secretary-treasurer, R. H. Olmstead, State College.

Poultry

THE increased interest in turkey growing was recognized by the Pennsylvania State Poultry Association and the State Baby Chick Association by devoting a half day to the care and culture of this famous American bird. Modern methods of growing turkeys was discussed by Prof. W. H. Rice of the University of Maryland, while Claud Irons of Linesville gave his personal experience in turkey production and Robert Lohr of Boswell spoke on the advantage of raising turkeys in confinement. Mr. Lohr raised a flock of some 3,000 head last year, starting them on clover pasture.

The poultry exhibits at the Pennsylvania State Farm Products Show were the largest and of the best quality ever exhibited. This year, for the first time, an unusually fine exhibit of turkeys was on display. Since the guess work has been removed from turkey raising this field of poultry production seems destined to become one of major importance in Pennsylvania. Never before was such quality apparent in the egg exhibits. Extreme care was used by most exhibitors in their selection of single and five dozen exhibits of eggs. The benefits from the Egg Show are difficult to evaluate but it can be said that they are many. When farmers and poultrymen learn to select eggs of good quality, size, shape and color, and set in their incubators only eggs with such qualities, then improvement will result. Pennsylvania poultrymen know their eggs.

Roast Capon

At 7 p. m. Wednesday evening the annual poultry banquet was held and was attended by over 100 poultrymen who presented, along with their tickets, a good appetite for roast capon and all the fixings.

Prof. E. M. Funk, of the Pennsylvania State College poultry department, said there was 25 per cent increase in production in Pennsylvania last year. During the past year, Pro-

fessor Funk stated, an experiment was started in applying the confinement method of management to turkey growing. Ninety-three per cent of all turkeys started were raised to market age, with good results obtained under the confined conditions in gains and returns over feed cost.

Sanitation in chick raising as practiced by poultrymen of Pennsylvania should reduce death of chicks and make for more economical production of pullets. D. C. Henderson, extension poultry specialist of State College, told members of the State Baby Chick Association.

With 159 Keystone poultrymen reporting last year, the average mortality of baby chicks was 15 per cent. Where none of the five recommended clean practices was followed, such as early hatching, clean chicks, clean grounds or partial or complete confinement, clean feed and clean brooder houses, the chick deaths were nearly 30 per cent.

Poultry Outlook

The national poultry outlook for 1930 is a promising one, with no great change over the 1929 situation, Harry R. Lewis, president of the National Poultry Council, stated in an address before the Pennsylvania State Poultry Association.

On Thursday morning Professor Lewis took for the subject of his address, "The Poultry Outlook for 1930." He stated that since 1903 the poultry industry had moved in a four-year cycle—three years of prosperity and one year not so good. The last bad year was in 1927-28. He looked for 1930 and 1931 to be profitable years. Professor Lewis stated that prosperity was dependent on stabilized output and the poultryman should avoid surpluses.

"If anything, there will probably be a continued slight increase in poultry population, with very satisfactory prices prevailing for eggs during the

first six months of the year," Mr. Lewis continued.

"The most serious situation facing the poultry producers during 1930 is the apparent continued heavy losses which poultry growers experience through ravages of disease and parasites. The intensive conditions under which poultry are kept, and the increased volume in which they are kept, brings with it increased responsibility on the part of the poultryman in effectively checking disease losses."

"The poultryman who makes a real financial success of his efforts during 1930 will do so principally through his ability to rear good, strong, healthy birds free from disease and parasites. This can only be done by practicing a strict sanitary program, by keeping his chicks on clean ground and not crowding them. This word of warning should be heeded, if the many advances and financial returns resulting from what now looks to be a most prosperous economic situation, are to be received."

In the afternoon address Professor Lewis spoke on "Promoting the Poultry Industry." He presented in a clear manner the work of the National Poultry Council as an organization composed of representatives of all allied branches of the poultry industry created for the purpose of promoting and protecting the poultry industry.

Directors for three years: H. H. Mitman, Hellertown, Pa., and M. M. West, Lansdale, Pa.

Poultry representative to the State Council of Agricultural Organization—M. A. McKnight.

Legislative Committee—J. P. Logan, DuBois, Pa., chairman; C. R. Misner, Williamsport, Pa.; Henry Hocker, Millville, Pa.; Guy Leader, York, Pa.; Paul Guldin, Yellow House, Pa.

The State Poultry Association elected the following officers: Marcus A. McKnight, Carlisle, president; C. W. Callenbach, State College, secretary-treasurer.

Livestock

SHOW and sales of 4-H Club calves and lambs featured the program of the Pennsylvania Livestock Breeders' Association.

Grand championship showing honors in the beef club exhibits of Lebanon, Cumberland and Dauphin counties were awarded today to George Strook, Cumberland county, P. C. MacKenzie, State College, was the judge. Alton Snyder, Lebanon county, won the reserve grand championship. The grand champion and the reserve grand champion were picked from the top animals among the baby calves shown by boys and girls of the three counties.

In discussing the champion steer Mr. MacKenzie said:

"The champion steer of the Boys' and Girls' Baby Beef Club Show at Harrisburg this year was a pure-bred Hereford, bred by St. Amour Farms, Nortonville, Pa. I would like to mention a few of the outstanding things about this steer. I think he was a very desirable weight, a very deep bodied steer, carrying parallel lines. He was better balanced and carried more condition, wider and thicker through his loins, much wider and deeper through his hind quarters, than the reserve. He was firm, smooth, mellow fleshing and

showed fine handling qualities, indicating a profitable steer. In type he was a steer of strong character, compact and low set, with desirable bone and a good Hereford coat of hair. I wish the boy who fitted him all the luck in the world and hope he continues to feed good steers."

Club Lambs

Clifford Fox, Clinton county, won the grand championship with a pen of three Shropshire lambs in the 4-H lamb club exhibits at the show. The reserve grand champion award went to Edwin Bitner, Centre county, showing a pen of three Southdown lambs.

Shropshire lamb winnings were: First, Clifford Fox, Clinton county; second, Clarence Hay, Centre county; third, Fred Fox, Clinton county; fourth, Richard Fox, Clinton county; and fifth, Charles Harter, Centre county.

Checked winners were as follows: Alice Faust, Centre county, first; Levi Nicholas, Northampton county, second; Florence Brooks, Centre county, third; Fred Lase, Centre county, fourth; Harold Homan, Centre county, fifth, and Lena Nicholas, Northampton county, sixth.

In the Hampshire lamb class the following (Continued on page 15.)

A View of Woodbine Farm showing the old house in which W. D. Zinn was born. See The Story of Woodbine Farm, now running in this paper.

"THE fleet would make a good ad. for that Red Mill concern," he remarked to Tigert.

"How so?" The Captain's nimble grey eyes steadied in a sudden keen look.

"Why, they cry for it like babies for milk. They won't take anything else. A spell back two of them raised a ruction cos you were out and I didn't have the key to the stock-room."

"You lay your mind off'n the Red Mill, an' the stock-room too," retorted Tigert with unexpected fierceness. "I've told you what I want you should do. Keep to that, understand? If I catch you—"

The rattling of the door-latch cut him short and he turned away and slouched into the book-keeper's cage as Mrs. Alfred Blainey and Miss Orianda came in, the former leading her pet collie on a leash.

While Mrs. Blainey was giving her order in elegantly mincing tones Toots' eye happened to stray in Tigert's direction and caught that individual scrutinizing him from under lowered brows with a hostile, suspicious expression. Toots returned the look squarely.

"Anything you want, sir?" he asked.

The Captain growled indistinctly and after a few moments walked into the stock-room, whose thick door he closed behind him.

Mrs. Blainey's collie had pulled itself free from her restraining clutch and was nosing about haughtily. Finally it invaded the private region behind the counter and discovered Hector, who came regularly to the store with Toots, and who had been in a smouldering state ever since his acute nose had detected the collie's presence. In spite of this outrageous intrusion Hector might have expressed his indignation by nothing more than a growl if the other had been willing to accept the reproof, but the collie chose to consider himself insulted and challenged. He attacked Hector instantly and the mongrel eagerly gave fight.

Toots, mounted on a rickety stepladder, was reaching for a package on the top shelf. The vocal ferocities of the dogs and the instant screams of the two women almost caused him to lose his balance, and he did lose it entirely a moment later when the combatants, in the blind rage of battle, hurled themselves against the stepladder. He fell sprawling across the counter, violently knocking askew in transit the hat of Mrs. Blainey, who was endeavoring to climb upon this point of safety, while the package of cereal flew from his hand and struck Miss Orianda upon her aristocratic nose.

Without stopping to consider these casualties he jumped from the counter and filling the big flour scoop from the barrel he threw its contents into the faces of the two dogs. Blinded and choking they separated to paw the flour out of their eyes. Toots seized the collie by the scruff of his neck and dragging him to the street door, flung him forth upon the sidewalk.

Mrs. Blainey and Miss Orianda faced him like irate turkeys. Their two tongues made such a clatter that Toots could hardly understand what they were saying, but he clearly gathered that the purport of it was uncompromising. Mrs. Blainey's hat hung rakishly over one ear and Miss Orianda's nose was red. Considering that he was to blame for both these effects he should not have smiled, but he did, and threw oil on the flames of their wrath by so doing. In the midst of it the stock-room door opened and Tigert entered. Mrs. Blainey turned upon him at once.

"I never was so outrageously treated in my life," she stormed. "Look at me! Look at my hat! I might have had my skull fractured. And my poor dog half killed by that nasty mongrel. If this is the sort of person you leave in charge of your store I shall give my custom elsewhere, Tigert."

WITH their heads in the air the two women left the store, slamming the door smartly behind them.

Tigert looked at Toots angrily. "Now what's this all about?" he said coarsely. "Here's a pretty kettle of fish. Turn my back for a minute an' you insult two of the best ladies of this town—or stick your nose into what don't concern you. You an' your questions about flour."

"I'm beginning to see light about that," remarked Toots pointedly. "And look here, Capt'n. You can't haze me any more. Give me my two hundred dollars. I'm quitting here and now."

He walked across the floor and took down his hat from the nail where it hung, Hector following obediently at his heels.

Tigert's gaze flicked for an instant. Something peculiar and ferocious came into it. "Your what?" he ejaculated slowly, as if he were not thinking of what he said. His whole face suddenly hardened. He uttered a short, barking laugh. "Where'd you get that notion? Why you young liar, you never gave me a cent of your money, if you ever had any, which I doubt."

Even in the midst of his dismay it struck Toots

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Stetson Company

as curious that somehow he should feel no great surprise; as if the suspicion that Tigert was capable of such a trick had not been far away from his mind all the time.

"You know you took my two hundred," he said. "It's in the safe, if you haven't spent it. If you have, you've got to give me the money just the same."

If I'd taken your money wouldn't you have asked a receipt for it? Wouldn't anybody?" grinned Tigert. "Two hundred dollars, eh. Where'd you get that much I'd like to know? Look out, young feller, or folks'll think you're crazy. I paid you your salary yesterday an' that's all you'll get from me."

"You're a thief," cried Toots. "I'll tell everybody you are."

Tigert grasped him by the shoulders and propelled him violently through the doorway and out on the sidewalk in the same ignominious fashion in which the collie's exit had been conducted. "If I hear you makin' any fuss about this I'll have you arrested," he threatened. "Judge Newton knows how to handle hoboos like you. This town is sick of your sort."

He shut the door and Toots, after a hesitating look at it, walked away with Hector at his heels.

Tigert, the solid resident and prominent store-keeper, was safe against any accusation of theft that a wandering, unaccounted-for character like himself could bring against him. Judge Newton was known to be a hard man with no fondness for cystemen or tramps, or anyone who was not a householder. What a fool he had been not to get a receipt for his two hundred. That error was going to make its recovery difficult; but Toots had no intention of letting Tigert get away with such a crude piece of knavery.

On his way to Daddy Simons' he met Mark Crumb, an oysterman whom he had seen in the store more than once. They passed with a nod of recognition, but an idea occurred to Toots, and retracing his steps he overtook the idly strolling sailor.

The Cheerful Plowman

BANISHING SUSPICIONS

I USED to be suspicious of the butcher and his aid; by methods surreptitious I believed they made the grade. "Those fellows are too clever," I was very prone to say, "so I know I must endeavor to defeat them by the way." "And the grocer and assistants, all of those," I said with zeal, "would offer small resistance to temptation live and real!" And the miller, I am certain, I was often known to state, "on his conscience has a curtain of a rather heavy weight! And the elevator fellow, he's the worst of all the bunch, all my barley ripe and yellow, I've a very certain hunch, he would weigh out slim and falsely on his tricky wagon scales, so my prudence checks and halts me when to him I'm making sales."

Yes, I classed them all as sinners, all as pretty, petty thieves, ready all to swipe my dinners and slip dollars up their sleeves. So for years I weighed each gander and each pizgie and each hen, each parsnip and oleander, weighed each one again, again, ere I took it in to market, ere I took it from the farm, on the little scales I'd park it and I'd weigh it like a charm.

Years went by, good years a-plenty, yet in all that time, I vow, amongst those dealers, twelve or twenty, buying grain, or pig, or cow, selling prunes or salted fishes, selling specials, buying runts, buying ducks or selling dishes, I was never cheated once! "What's the use and what the dickens?" I at last was forced to say, "why weigh out my beans and chickens in this mean and toilsome way?" So I quit my fool suspicions, threw away my scales in haste; now I give to worthy missions all the time I used to waste!

"Mean day," he observed, falling into step with the other.

"I was just thinkin' it was a pretty fine one to be wasted ashore," Crumb solemnly.

Toots surveyed the sky and found it blue and cloudless. "Well—I've got Tigert's," he said, with perhaps more relevance than appeared on the surface.

Crumb was gravely interested. He was an unsmiling person—and he briefly sketched the causes of the downfall. He omitted any reference to the two hundred dollars.

"What I wanted to say," he added, "is, could you give me a job, Capt'n Crumb? You know I sailed with Mr. Rose and I can work 'most any of the boats round here. Sharpies and bug-eyes mean, I can run a gasoline engine too. Ask Mr. Rose."

Crumb scratched his chin through its short black beard. It was a hopeful sign that he appeared to ruminate. Toots struck while the iron was warm. "I don't want more'n I'm worth," he said shyly. "Try me out, Capt'n, and then you can arrange with me to pay me. I've just got to have a job. Mr. Rose promised to take me back when he sails, but reckon that won't be for some time."

"Is that so, that you got Tigert to fix up all store?" asked Crumb. "Letter the shelves an' that?"

"Yes sir. I had to have some way of making easy at the start."

"Easy for the customers too," said Crumb. "I never got waited on at Tigert's less'n half an hour before. Well, I dunno. My brother Elder down with pains in his back an' there's no tellin' how long he'll be crippled. I might take you for a spell. Maybe that's as long as you'll like. Go to night?"

"Sure, Capt'n. I'll meet you any time you say. 'Call it five, at the landin'." Sharp.

Well, it was better to have a job than to be without one. Nevertheless as he turned back Toots began to look at himself more impersonally than he has habit. Except for the interval at the Brown View Hotel a low valuation had always been put on his services. As a matter of fact he himself had always been ready to do this, and certainly no man had ever disputed his own estimate of his worth. Money was not everything by any means. He could not see himself in a position when he was ever think that, it was not in his blood, but it occurred to him that life would be easier if he possessed the ability to earn a fair salary. Being good boatman was not enough; there was nothing unusual in that. As a specialty it was not profitable. He recalled again how the Colonel had emphasized the importance of reading, of getting by knowledge and applying it. Jack Rose had learned to know the human body, its muscles and how to develop them properly, and he had explored this knowledge in a definitely scientific way through his gymnasium appliances. Rose's mind wasn't brilliant that there was danger of its setting in to any river, but Rose had been sufficiently clever to master a subject and capitalize it.

HE must begin to keep his eyes open for a future path that wasn't just the easy downhill one. Toots mused as he walked toward Daddy Simons. Thoughts of Tigert and the two hundred dollars also racked him. He was going to get his money back somehow. He didn't intend to let that put anything like that over on him. There was way perhaps—he wasn't quite sure of his ground, but the thing was worth trying. Yes, he believed he was justified in doing it—justified in every way. The fellow was a law-breaker in more ways than one.

Toots stopped the first person he met, who happened to be Mr. Joe Hoskins, the canine expert, and drew him mysteriously aside. "Look here," he said. "Want to take part in a little surprise party?"

Joe was instantly all attention. "What's that, who on?" he asked.

"Ssh! Don't talk so loud. On Capt'n Tigert, think—mind you I'm not sure—I think he's got something worth seeing in his stock-room. Somethin' he don't want anyone to see or even know he's got, but we've got the right to. Everybody in this town's got a right to know. In fact it's my duty to find out about it."

A duty of this description seemed one of the order to Hoskins. He spat briskly and rubbed his hand across his mouth as if by doing so he was a full official toilet as investigator into his neighbor's affairs. Then his expression changed. He looked dubious.

"I reckon I don't get your drift," he remarked. "What could Tigert have that we-all got a right to see? I ain't heard anythin' to that effect. What's so mysterious about it?"

"I can't explain now," said Toots. "But you can with me and you'll see something. You won't go into trouble. I'll do the talking and all you need do is follow."

A Week of Thrills

By GERTRUDE S. STEWART

AGRICULTURAL Week in New Jersey was one round of thrills for the ambitious and alert rural wife and mother. The weather none too promising on any morning but the words of eager attendants at the various phases of life and the enlarged view points never seemed to notice the fogs nor occasional down-pours.

The visits connected with the state's museum historical spots were enjoyed by all. The trips industrial plants brought us into contact with the phases of life and the enlarged view points rich in food for future thought over the iron-board or while darning the family socks. A complete change of scenery is always very restful and invigorating.

"Household Hints"

We hope you may find at least one new idea in the little tips which visiting delegates exchanged at the opening dinner. Then guests in the home remain over a second day an attractive way to mark the napkins place at each cover one-fourth yard of wide ribbon, a different color for each place. They have great fun tying the bows close to the first meal and the table looks like a spring flower garden.

A little rubber dish scraper at the "five-ten" and use it to save hard dish-washing and to scrape the dishes.

Can avoid scraping carrots by scrubbing them well and boil till just tender. Plunge cold water and the skins rub off easily. Proceed to dress them up in any preferred way.

When baked white or sweet potatoes are turned the oven off, and leave them in for ten minutes longer. Then the skins can be moved easily and with little or no waste. I hear a number of you say, "Easy to say but how do we do it in our wood or ranges?" You can use the warming oven if have one or open wide the oven door.

Narrow shelves under the kitchen sink provide a good place for overshoes if there is no stairs closet.

Little starch added to the last rinse water on days will give the table and bed linens a very finish, when the ironing is done. Wearing other than underwear is helped also by this plan.

Home-made floor wax consists of one-pound bees' wax, one-eighth pound paraffin, pint of turpentine.

Use your rolling pin with a child's white rag if you wish to avoid the usual sticking. A piece of clean canvas is a better working surface than a floured board, too.

Bleberries that Are Large as Queen Anne Cherries

was a real treat to hear Miss Elizabeth C. of New Lisbon, N. J., tell of her twenty days in adventuring with huckleberries. I was impressed with the fact that although she never father had in mind the splendid idea of using the ordinary swamp huckleberry, yet her great inspiration came from close study of the town's got a right to know. In fact it's my duty to find out about it."

A duty of this description seemed one of the order to Hoskins. He spat briskly and rubbed his hand across his mouth as if by doing so he was a full official toilet as investigator into his neighbor's affairs. Then his expression changed. He looked dubious.

"I reckon I don't get your drift," he remarked. "What could Tigert have that we-all got a right to see? I ain't heard anythin' to that effect. What's so mysterious about it?"

"I can't explain now," said Toots. "But you can with me and you'll see something. You won't go into trouble. I'll do the talking and all you need do is follow."

(To be continued.)

The Farm Home

Beats Jack Horner

THERE is competition in the pie business, just as in all others, and I am afraid Jack Horner has lost first place. The one I am telling you about was baked last September at Albion, N. Y., under the auspices of the Orleans County Agricultural Society.

Once in my lifetime, I helped bake six hundred hot biscuits for the wounded veterans of several wards. They were being given a honey-biscuit feast on Valentine's Day at the hospital. Our famous Congresswoman, Mrs. Edith Rogers of Massachusetts looked on and thought it an impossible task. What would she think about this huge pie? Surely that great lot of biscuits seems trifling in comparison.

We used the huge ovens in the hospital kitchens, but here a special oven had to be built. It was fourteen feet square, and forty-two inches high. It used two tons of concrete in the making, and one ton of steel reinforcing. Ten gas burners five feet long heated the huge oven, which had to be preheated for two days.

It was one of America's favorites—a good old apple pie. Imagine if you can a twelve-foot pie holding one hundred twenty-five bushel baskets of prepared apples which were raked into position with a specially made rake. Five hundred pounds of sugar, four hundred fifty pounds of lard, fifty pounds of salt, five gallons of lemon juice, and I nearly forgot—six hundred pounds of best flour, all went into that master pie. And it was delicious. So said the vast throng who got a taste at ten cents a slice.

Doesn't that sound like a fish story? Well, it isn't. It's a really true pie story and it makes me hungry to be writing about it.

Split Pea Souffle

THE combination of several eggs with the puree obtained from cooked split peas makes this a hearty enough dish for lunch or supper. Serve it with a crisp raw vegetable salad. The recipe is from the Bureau of Home Economics.

Four eggs, one-half cup green split peas, one and one-half cups water, one cup milk, two tablespoons flour three tablespoons butter, four tablespoons fine cut celery, two tablespoons fine cut onion, three tablespoons fine cut parsley, one and one-fourth teaspoons salt, one-eighth teaspoon pepper, several dashes tabasco.

Wash the split peas. Soak them in one cup of the water overnight. In the morning, add the remaining water to the soaked peas and cook until very soft. Press through a fine sieve. Cook the celery and the onion in the butter for a few minutes. Stir in the flour until thoroughly mixed, then add the milk, and cook until thick. Pour the hot mixture into the well-beaten egg yolks. Add the pea puree and the other seasonings. Fold in the stiffly beaten egg whites. Bake in a buttered dish in a very moderate oven (300 degrees F.) for about one hour, or until set in the middle. Serve at once.

Timely Tips

Beaten egg white with the little tots' orange juice is often enjoyed by them, and is quite beneficial, too.

We find the toothpick a sanitary and efficient implement to "try" cakes, instead of the old-fashioned broom-splint.

Plan your meals ahead of time, at least the night before. The day's work gets under way better with a pre-conceived plan.

Once a week, or as often as you can, take an afternoon "off," just to do what you want to do. You will find stimulation and pleasure, the general tone of your work will be higher. You will accomplish more in the end.

Glycerin and rosewater should be rubbed generously and well between the eyebrows ten minutes before one attempts to pluck the eyebrows with tweezers. This preparation will make the plucking easy and painless.

size, flavor, content, texture, skin, etc. Let us get out of time-worn paths and, like Miss White, go adventuring. Our lives will take on new interests, and the world will be a better place for our having been here.

The Wholesome Family

Dr. Caroline B. Zachry, psychologist in one of New Jersey's Teachers' Colleges, outlined for us the essentials of a wholesome family life. You will like to cut this out and tack it by your calendar or where you can see it often.

1. The home must be a place where everyone concerned can accomplish the inborn desire to do things.

2. There must be such a feeling in the home atmosphere that every one feels accepted, needed, and wanted in the group. This she thinks the "crucial point" of wholesome family life.

3. The daily living must be such that proper behavior patterns are ever in evidence. In a future story we hope to enlarge upon this subject.

No Back-Seat Driving

One of the Master Farmers who was given his award during Trenton Week asked that his wife

Here you see the famous chef (inset) H. S. King, of Rochester, N. Y., who managed the world's biggest pie. Note the huge rolling pin which was five and one-half feet long, eight inches in diameter and weighed seventy-five pounds.

be given as much credit for their honor as he was getting. He said she never did any back-seat driving, but was always "by his side." He gave great praise also to his county agent whom he said had been of great assistance to him. It was his custom to take his farm troubles to the county agent, and he never failed him. If the problem was beyond the two of them, they fell back on the State Experiment Farm.

Boost Your Own Business

Mrs. Charles W. Sewell, National Chairman of the Home and Community Department in the great Federation of Farm Bureau work wonders why it is that so many farmers hang back from being Farm Bureau workers and thereby in the greatest possible way advertise their own business.

She recalled how thirty-two years ago she and Mr. Sewell, after just being married, hung their heads when asked their business, and dodged the question if at all possible. If it could not be evaded, they would reply, "We don't really have a business; we're just farmers." Too many of us have kept that attitude. When we all awake to the fact that it is the greatest business on earth, rural life will know better living.

Farm organizations are yours to help you better your own business. Do you let them do that for you? Women have a great part to play in the home attitude toward Farm Bureau and other farm organs that bring the farm into the limelight of this nation's business. Never say die. Keep thinking, working and hoping toward your own and your neighbor's broadened life.

AN EARLY START

START the baby very early in the things you want him to grow up doing. For instance, teach him to eat the bread crusts as well as the bread. When he is able to toddle about, spreading his toys, teach him to pick up the toys after he finishes playing with them. Teach him to look both ways before crossing the street. Look to the left first. Teach him to beat time to music. This instills rhythm.

M. C. B.

Little Drops of Water

By GRACE SHEARER

There was once a county superintendent of schools who was as kindly and good a man as one may find. He had an old maple desk where he spent most of his waking hours. It was a serviceable desk except for one drawer, which worked only at times. Usually all the pulling and coaxing in the world would not induce this drawer to open more than a few inches. On these occasions the contents had to be removed one at a time in the most exasperating manner. The drawer was often examined but never corrected.

The superintendent grew old and grey in service, his nerves grew less steady and his temper less certain.

One day when the drawer refused to work, his secretary, a kind and patient soul, suggested that he have a new desk ordered. Before taking time to consider the extra expense to his county, as was his custom, he ordered the new desk.

Papers and everything were transferred from the old to the new desk. The superintendent sat down and tried each drawer and one after the other moved smoothly, silently. The man breathed a contented sigh and began work. His secretary, a woman of vision, smiled a knowing smile and went back to her work.

Now the superintendent delights to tell his friends how much benefit he is deriving from a course of physical culture. His secretary smiles!

Catalogue Your Troubles

Have you ever noticed a change in the disposition of another? Always another, of course! To what do you ascribe this change? You do not know? It may be some real trouble, but happily not often. It may be caused by both large and small troubles combined, but more often it is caused by numerous small troubles.

Why not be (like the secretary) a woman of vision? Hunt out the small troubles and correct them now while the disposition is still sweet, the nerves steady and the temper under control. Winter is a splendid time to begin. Those little noises, those small inconveniences that wear our nerves and spoil our sunny dispositions, let us hunt them out. Which board in the floor creaks each time we step on it? Which window rattles? Which shutter rattles when the wind blows?

Don't Wait Until Spring

Why do we, day after day, grope in a dark pantry when a small inexpensive light would end the necessity? Why look at a picture askew? Why be compelled to gather up the daily newspaper after it is read each day? Why be forever tearing clothes on the nails in the closet when hangers are so very inexpensive? Would it not be easier to hunt out all these small troubles and cure them before we ourselves become incurable?

Needless to say, it is the woman of the house who suffers most from these small, unnecessary worries, but it is she who is least able to cure them.

Why cannot the man of the house take a day and cure most of these troubles? At this time of the year there are few better uses to which he could put his time. Then while he is at it let him take a little time to mend some things for himself. Why not fix the door of the coal bin so that coal is not spilled all over the cellar floor, oil the hinges of the creaking doors, fix the handle of the hay fork, and don't forget to order a couple dozen new ash trays to complete the good work?

Wait not until you are buried in the regular spring work and cannot afford to take the time. But do it now. Mend all the little troubles so that the woman of the house may have a happier life and be able to add more to the comfort and general well being of the whole family.

Short Sleeves Again

No. 6764.—V-necked, tweed, flannel and sturdy wash fabrics are recommended for this pleasing model. The blouse is made with double-breasted fronts, and a broad collar. The trousers show a new pocket arrangement and are made with a fly and side closing.

This pattern is cut in three sizes: 2, 4 and 6 years. To make the suit for a 4-year size will require 1½ yards of 35-inch material. The blouse alone will require 1 yard of 35-inch material. The trousers alone will require ¾ yard 35 inches wide cut crosswise. One-fourth yard is required for the pockets of muslin or lining, cut crosswise.

No. 6748.—One may be busy about the house and yet look trim and neat in a pretty frock made from this model. The long waist portions are joined to gathered flounce sections. Groups of tucks give fullness at the shoulders in the front and a small vestee squares the V neck line.

This pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. To make the frock for a 38-inch size will require 2½ yards of material 35 inches wide or wider. For a belt and tie of contrasting material as pictured in the large view, ½ yard is required 35 inches wide and cut crosswise. To finish with bias binding will require ½ yard 1½ inches wide. The width of the skirt at the lower edge with fullness extended is 1½ yards.

No. 6739.—Transparent velvet in a new shade of green was used for this distinctive model. Stitching in self color, and crystal buttons are the only ornaments.

This style is also attractive in cotton crepe or in moire. The waist blouse is slightly above a narrow belt. Shaped yoke sections, deep at the right side are joined to flare skirt portions. A band facing outlines the V neck of the front, and narrow shoulder tucks, give pleasing fullness. The sleeve is a fitted model.

The pattern is cut in eight sizes: 38, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. To make the dress for a 40-inch size will require 5½ yards of 39-inch material. The width at the lower edge with fullness extended is 2½ yards.

No. 6741.—This distinctive model has the molded hip line, and graceful curves in yoke sections, to which a flare flounce is added. A broad vestee is outlined by wide revers. The sleeve is a fitted model. Groups of shoulder tucks trim the front. Crepe back satin, or cotton crepe may be selected for this design. It is also suitable for transparent velvet and for light weight woollens.

The pattern is cut in six sizes: 34, 36, 38, 40, 42 and 44 inches bust measure. To make the dress for a 38-inch size will require 4½ yards of 39-inch material. For revers facings and a tie as illustrated, contrasting material ¾ yard 39 inches wide is required, cut crosswise. The width of the dress at the lower edge with fullness extended is 3½ yards.

6754.—Printed and plain linen are here combined. One could use cotton prints of two colors of plain linen, with binding in a contrasting color. Light weight woollens, such as wool crepe or georgette are also

suggested. The yoke portions are points—the center point extending to the skirt and holding the inverted waist blouses over the sides. The back—above a narrow belt. A pattern of orange and blue pattern with a little of green could be used for this with the blue repeated in the yoke, and green in the binding.

This pattern is cut in four sizes: 12 and 14 years. To make the dress 12-year size as illustrated in the large view will require 5½ yards of material 35 inches wide. To make the dress 14-year size will require 6½ yards 1½ inch wide.

No. 6759.—Chiffon is suggested for this model, with frills of the same material. One could use taffeta, or crepe, or cotton prints. As planned in the large view, the sleeves are gathered in a small front view, the dress is with the sleeves—which are in the style—and without the collar. A development would be in light green, maize colored taffeta, with frills of orange or gray.

The pattern is cut in five sizes: 4, 6, 8, 10 and 12 years. To make the dress 4-year size will require 2 yards of 35-inch material. To make the dress 12-year size will require 2½ yards 35 inches wide. To the dress with frills or ruffles, as illustrated will require ¾ yard of material, crosswise and in strips 1½ inches wide, best finished with picot. The skirt requires 1½ yards of ribbon.

Write your name and address clearly. State number and size of each pattern. Price 15c each, for 25c. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Embroidery pattern 15c extra. Address Pattern Department, Pennsylvania Farmer, 1200 Penn. Ave., Pittsburgh, Pa.

Do You Help Your School Teacher?

By EX-TEACHER

Do you lend a helping hand to district school teacher? If still have a one-room school, are some of the things we, in operation with our teachers, have accomplished for our school during past four years.

First—A small oil stove and old wash boiler in which each puts a can of cooked food to be the noon lunch. The food is prepared by the mothers and it is a great task to repeat it. The cans or glass jars are used.

Second—A parent-teacher organization with monthly programs. We at school to hear our children speak and recite.

Third—We invite the teachers when we have any special treat an evening trip to town or to a picture show or entertainment.

Fourth—We have subscribed several good agricultural and children's papers for supplementary reading and for rainy noons.

Fifth—We have observed and other holidays usually passed in the country.

Sixth—We have almost money for a second-hand piano be used in the school. This has gathered together by exchanging entertainments.

HOUSEHOLD HINTS

When papering with oilcloth, some one work with you. A pasted prepared oilcloth is handled. I made my paste of laundry starch, cooked as for ironing clothes. For a small room two pounds of powdered glue solve it with hot water and with the starch paste.

The radio brought me such a recipe for salmon. One can but such clever curtains as they are. Any kitchen that can accommodate a note of geranium red—and that kitchen can not—should welcome these cheery blooming plants in the windows. Leaves and handle facing are green with blue and a black finishing line.

The pattern provides three pots to wash curtain, or you might prefer on each side in pairs. One might used for a glass door. In any

By the Pleasant Road of Praise

MRS. KINGSLAND looked up with a smile as Mrs. Matthews, worried of face, came around the corner of the house. Suspecting the cause of the frowns she asked as she placed a chair, "How's Dorothy's ironing coming along?"

"Oh, dear!" groaned Mrs. Matthews, "I made her rinse the things and hang them on the line again. Now she's in her room crying. I don't know what to do. She's been weeks doing a little sewing—had to rip two garments and do them over."

"Well, well, poor child! She's had hard time from start to finish. May, you're too particular, my dear," Mrs. Kingsland's kind old face was so tremulous in her desire to attack her neighbor's methods and yet have no offense.

"I am particular. I want her to be perfect in every way."

"But one must remember, you will see, that superiority in a child is very different from superiority in you."

"Yes, but—the essentials! Look at my Margaret! You trained her. I wish you'd give me your method." "Yes, I taught her the essentials. I also taught her what the essentials are—two very different things."

"I don't—"

"That is, I painstakingly taught her to slight and how to slight it," Mrs. Matthews gasped, "You taught her to slight—"

"Yes, to slight the non-essentials. You asked for my method—"

"Yes, begin with sewing—"

"Almost from babyhood, Margaret wanted to run the sewing-machine."

"So did Dorothy; but, of course, sewing comes first."

"I didn't insist upon it with Margaret. When she was twelve I let her make an apron. I cut it out and showed her how to run the machine. That was all, except that when she asked for help, I gave it, and I made the ironing work you insist upon; but I was well pleased."

"Yes—"

Flowers for Your Kitchen

NO. 559 WAX TRANSFERS

This design is for curtains only, but such clever curtains as they are. Any kitchen that can accommodate a note of geranium red—and that kitchen can not—should welcome these cheery blooming plants in the windows. Leaves and handle facing are green with blue and a black finishing line.

The pattern provides three pots to wash curtain, or you might prefer on each side in pairs. One might used for a glass door. In any

"By the time she was sixteen she had made three complete sets of undergarments, two dresses and many other things. She had learned to sew and had been happy through it all. Wait," and Mrs. Kingsland hastened into the house.

"These tell the story," she said as she came back breathless, a book in her hand. "Her brother took these pictures for me. Here she is in her first apron. See, her age is written beneath."

"Here she is wearing the dresses she made before she was sixteen. And here," Mrs. Kingsland's eyes glowed, "here is a picture of the machine her father gave her on her sixteenth birthday. I remember she threw her arms around his neck and cried, she was so happy. She has that same machine in her own home now."

"Oh, I wish I had tried some such way," cried Mrs. Matthews. "I wonder whether I could make it work now!"

"Of course you could. Begin with those very things on the line. Iron them yourself. Tell her you thought she'd worked hard enough. Then praise some of those she did. I'm sure some of them must be all right."

"They are," Mrs. Matthews' face quivered.

"Now, my dear, my whole method was this: I didn't ask for perfection, and I praised when I could. When I couldn't, I remembered that she was just a little girl preparing herself to do the hardest, but also the noblest work in the world, and I encouraged. Praise and encouragement will carry one far toward perfection—and you yourself say that my Margaret is a perfect housekeeper. She is. She keeps her little home in charming condition. Her three children are clean and sweet and well-behaved; she, herself is cheerful and in good health, and she finds a little time to keep up her music and painting. Just praise, nothing else. You go home and try it."

"I will—and thank you." There were tears in Mrs. Matthews' eyes, but her voice was full of hope.

Praise be for Calumet's Double-Action..

What beautiful cake it makes!

What light cake . . . so fluffy and tender! And Calumet biscuits and muffins, too—they're wonderful! Baking success is easy when you've discovered Calumet—the Double-Acting Baking Powder.

Calumet's first action takes place in the mixing bowl. This gets the leavening properly started. Then, in the oven, the second action occurs—a new, full, steady rising that literally props up the batter until your cake is perfectly baked—even though you may not be able to regulate your oven temperature perfectly.

All baking powders are required by law to be made of pure, wholesome ingredients. But not all are alike in their action. Not all will give you equally fine results in your baking. Calumet is made of exactly the right ingredients in exactly the right proportions to produce perfect leavening action—Double-Action.

Bake a Calumet cake today. See for yourself why Calumet's Double-Action has made it the most popular baking powder in the world! Use only one level teaspoon of Calumet to a cup of sifted flour. This is the usual Calumet proportion for best results—a real economy too. Send for the new, free Calumet Baking Book.

MAKE THIS TEST

Naturally, when baking, you can't see how Calumet's Double-Action works inside the dough or batter to make it rise. But, by making this simple demonstration with only baking powder and water in a glass, you can see clearly how baking powder acts—and how Calumet acts twice to make your baking better. Put two level teaspoons of Calumet into a glass, add two teaspoons of water, stir rapidly five times and remove the spoon. The tiny, fine bubbles will rise slowly, half filling the glass. This is Calumet's first action—the action that takes place in the mixing bowl when you add liquid to your dry ingredients. After the mixture has entirely stopped rising, stand the glass in a pan of hot water on the stove. In a moment a second rising will start and continue until the mixture reaches the top of the glass. This is Calumet's second action—the action that takes place in the heat of your oven.

Make this test. See Calumet's Double-Action which protects your baking from failure. © 1930 G. F. Corp.

MUSCULAR RHEUMATIC Aches and Pains

DISTRESSING muscular lumbago, soreness and stiffness—generally respond pleasantly to good old Muscrole. Working like the trained hands of a masseur, this famous blend of oil of mustard, camphor, menthol and other helpful ingredients penetrates and stimulates blood circulation and helps to draw out infection and pain. But relief is surprisingly complete, natural and safe when this

soothing, cooling, healing ointment is applied generously to the affected area **once every hour for five hours.** Used by millions for over 20 years. Recommended by many doctors and nurses.

Keep Muscrole handy, jars and tubes.
To Mothers—Muscrole is also made in milder form for babies and small children. Ask for Children's Muscrole.

Markets Discussed

FARMERS' markets bring business to the section of the city in which they are established and thus contribute to the financial welfare of the city. H. A. Hanemann of the Bureau of Markets, Pennsylvania Department of Agriculture, asserted in discussing the need for greater cooperation between the municipality and farmers' markets. Mr. Hanemann addressed the State Association of Markets which convened in the State Chamber of Commerce.

"Municipal authorities should cooperate in every way possible with the farmers' markets so that the utmost of business activity can be stimulated," Mr. Hanemann explained. "Ways in which the authorities can help are numerous. Some cities prohibit parking on the streets from two a. m. to 5 a. m., and right here municipal officials can assist markets. Many farmers arrive at market before 5 a. m., and such prohibition of parking works a hardship on them as they have no place close to the market where they can park their wagons and trucks. A modification of such ordinances permitting parking by farmers within a restricted area near the market before 5 a. m., might encourage more farmers to come to market. A system of permits for parking during the prohibited hours could be worked out cooperatively by the markets and the officials."

"The city health authorities can be of very great aid to markets by cooperating with the managers and stating definitely the kinds of covering and protection which the market company shall require its tenants to use for the maintenance of foods in sanitary condition. The municipal authorities in some cities of the state should also give greater attention to the condition of the streets around a market, and should make greater efforts to keep them clean."

Market Reports

The dissemination of reliable market information has done much to systematize marketing and to prevent the overloading of markets. W. R. Whitacre of the Pennsylvania Bureau of Markets stated.

"It has discouraged the circulation of fictitious reports of market conditions and prices," Mr. Whitacre continued. "It is believed that it stimulates healthy competition, discourages wasteful and unfair practices, and generally helps in raising the efficiency of the fruit and vegetable industry."

Women Addressed

Better living conditions for the American farm family are in sight, if the promise of economic improvement held forth by the Agricultural Marketing Act is fulfilled. This is the vision of Mrs. Charles W. Sewell, Director of Home and Community Work for the American Farm Bureau Federation, who spoke at the meeting of the Society of Farm Women of Pennsylvania.

"If the things hoped for under the new Marketing Act materialize," said Mrs. Sewell, "the increased income for the farm family will be soon translated into better standards of home life. It is well known that when farm incomes are small, the effect is first felt in the farm home, and so the things that produce no money return are eliminated from the family life. When the promised relief reaches the farmer's pocketbook, all this should be changed."

Mrs. Sewell defined the purpose of the Home and Community Department of the American Farm Bureau Federation as "to interest, inform and enlist all farm families in an effort to secure an adequate standard of living."

"The time is opportune for every sincere friend of agriculture to change front and 'talk up' agriculture instead of talking it down as has been done so generally in recent years," Congressman John C. Ketcham of Michigan stated in his address at the opening meeting of the Farm Show.

"No business could have survived the harsh things said of it by those actually engaged in it," Mr. Ketcham continued.

"Anything that legislation cannot do—everything for agriculture, it is futile to assert that nothing can be done," the Congressman said, in discussing the subject "What Can the New Farm Board Do for Agriculture?"

"Federal legislation has made advantages possible for particular groups and it is but natural that agriculture should make its appeal and that Con-

gress has passed the Relief Bill in answer to it.

"We can hope from the Agricultural Marketing Act all that can possibly be done for agriculture by brains, power and money."

Theory of the Act

"In marketing the farmer has been to a great disadvantage. For the most part he has operated as an individual competing with the united and well financed group of distributors. He has virtually taken the distributor's offer. This is not in accord with modern business practices. It is the theory of the Marketing Act that agriculture should have the right to take its finished product into which has been put its time, money and brains, and carry it over to the ultimate consumer along with all the pride of production which it has put into the production enterprise and lay it down before the ultimate consumer with the same pride that industry has in its finished product and to say to the consumer: 'Here is the kind of thing we produce and here it is laid down to you directly by those of us who have a real interest in it from the very time of its planting and production down to the time it is delivered to you.'"

"It is a matter of great encouragement that there are today more than two million farmers in the United States associated together in approximately twelve thousand five hundred cooperative organizations. The difficulty with these organizations is that their usefulness has been particularly restricted to economies in the assembling, and in some instances processing of the commodity, in their local community. Only in a few cases have they attained enough financial strength and experience to enable them to be a factor in the general price situation of the commodity. They have lacked the strength that would inevitably come from an organization representative of the whole commodity."

"Self-help and farmer control under the encouragement of the Farm Board is the real heart of the new law. It can do little for the farmer unless he cooperates actively."

George H. Etien, Philadelphia, was re-elected president of the State Association of Markets, in its annual Farm Show convention. H. L. Shank, Lancaster, was named vice-president, and H. A. Hanemann, of the Pennsylvania Bureau of Markets, Harrisburg, will continue as secretary-treasurer.

As a result of a talk by Thomas C. Mirkl, publicity director of the State Chamber of Commerce, the Association appointed a committee which will endeavor to get all farmers' markets in Pennsylvania to adopt a state-wide cooperative advertising program.

H. S. Throm of Reading talked on the necessity of modernizing all farmers' markets as a step in increasing trade.

A committee to undertake a state-wide advertising program was named as follows: H. L. Shank, Lancaster; Chas. N. Walmer, Harrisburg; Chas. K. Diek, Reading; H. A. Hanemann, Harrisburg.

JOHN SHOENER, Orwigsburg, was re-elected president of the Association of Members of the Former State Board of Agriculture and Institute Lecturers in its annual meeting. R. W. Lohr, Doswell, was renamed secretary.

THE Pennsylvania Nurserymen's Association in annual convention here elected the following officers: President, Lester W. Needham, Weiser Park; vice-president, Lewis U. Straussberger, Flourtown; secretary, Floyd S. Platt, Morrisville, and treasurer, Albert Meehan, Dresher. Seventy-five nurserymen attended the meeting.

J. N. Knull, entomologist of the Bureau of Plant Industry, Pennsylvania Department of Agriculture, was elected president of the Entomological Society of Pennsylvania in its Farm Show convention. H. N. Worthley of the Pennsylvania State College was named secretary.

THE Pennsylvania Beekeepers' Association elected for its president Dr. H. A. Surface, Selinsgrove; vice-president, E. J. Anderson, State College; secretary-treasurer, Charles N. Greene, Harrisburg.

THE Pennsylvania Threshermen and Farmers' Protective Association in its business meeting elected the follow-

HOFFMAN'S Red Clover Alfalfa 1930 Seed

**U.S.
Government
VERIFIED
ORIGIN**

Uncle Sam's official tag will be on every bag of Hoffman's native-grown Red Clover and Alfalfa Seed. You know for sure just where your seed was grown.

Verified-Origin is a three-cornered agreement between the grower, Federal Government and ourselves... with Government inspection to check up on us. Every pound carefully checked and sealed. This protects you against unsuitable seed. Prices: Red Clover \$6 to \$7 per bushel under last year. Send today for samples.

ing officers: President, H. L. R. Anderson, Grove City; H. M. Kauffman, Lancaster, vice-president; J. A. Rose, Harrisburg, secretary-treasurer.

Turkey growing in complete confinement also was depleted by means of posters and charts. A Bronze turkey and a White Holland turkey in cages posed as living results of the new system of growing the holiday birds.

Of particular interest to girls and women visitors at the farm show was the exhibit staged by college home economics workers. This is a full size room with furniture in place and the proper colors as arrangement of furnishings to make the best better in the girl's room.

Breed Associations

Guernseys

The Guernsey breeders this year followed the general type of exhibits shown at last year's Show. They exhibited four outstanding Guernsey cows representing the true type, conformation and production ability of the best Guernsey cattle. In addition to these they exhibited 12 young bulls all tested for abortion and tuberculosis and all coming from outstanding herds and with records on their dams averaging from 600 to 800 pounds of fat a year. Ten of these bulls were sold by Thursday evening at prices ranging from \$125 to \$500. All of these bulls were sold to Pennsylvania farmers and will head herds in this state in the future. The object of this project of selling sires is not one of disposing of surplus bulls but rather aims to give farmers coming to this Show an opportunity to purchase at reasonable prices some of the outstanding sires of the breed.

Holsteins

A complete show herd was shown by the Holstein breeders, consisting of a bull and of one female in each class of a show herd. The records of production and the type of each of these individuals likewise represented the best of this breed.

In addition to this breed exhibit were shown 25 Holstein heifers owned by the boys and girls in the Dauphin County Calf Club. Harold Graybill exhibited the champion, and John Kore, the second prize winner of the class.

Jerseys

The Jersey exhibit consisted of one bull and ten young cows all coming from Wayne county and all owned by Association members of the Jersey Bull Association in that county. Five of these cows are daughters of You'll Do's Jolly Warder, a sire used in this county for seven years. The other five are daughters of another Association sire used in that Association. All of these show a considerable improvement in production and type over their dams. The entire exhibit aimed to show a correct Jersey type as well as what can be done by the use of good sires.

Ayrshires

The Ayrshire exhibit was very unique in that it consisted of but two animals, but both of them nationally known. The one was one of the two cows that walked from Vermont to the National Dairy Exposition at St. Louis this fall. The other was the bull calf dropped after the mother arrived at that Exposition.

The various dairy breed organizations of the state also held meetings during the week during which officers were elected as follows:

The Federation of Holstein-Friesian Clubs of Pennsylvania re-elected the following officers: President, H. D. Allebach, Trappe; vice-president, J. G. Kerick, Towanda; secretary-treasurer, H. E. Robertson, York.

The Brown Swiss Cattle Breeders' Association re-elected Kenzie S. Bagshaw, Hollidaysburg, president; H. L. Graziop, Warrior's Mark, vice-president, and Irma C. Wohlwend, of Salina, secretary-treasurer. This association will hold its annual picnic at the Pennsylvania State College some time in June, according to a decision reached at its business meeting.

J. M. Risinger, Homer City, was named president of the Pennsylvania Jersey Cattle Club at its business meeting. J. L. Wyke, Jeannette, was re-elected secretary-treasurer.

The Pennsylvania Ayrshire Breeders' Association elected the following officers: President, Andrew H. Hershey, Elizabethtown; vice-president, Thomas

**COMING—
The New OLIVER HART-PARR
"ROW CROP"**

The "ROW CROP" treads on tiptoe—on toe tips that cultivate the soil. It pulls like a locomotive—whether plowing, planting, cultivating or harvesting—more power than any row crop type machine ever had before.

It's new from radiator cap to those tiptoe wheel treads. It's new in design, new in appearance, new in performance—different from any general purpose tractor you've ever seen.

Soon you'll find the "ROW CROP" wherever dealers fly the flag of Oliver. Before you buy this spring, be sure you've seen and tried Oliver's newest and greatest contribution to cutting the cost of raising crops—the New Oliver Hart-Parr "ROW CROP" Tractor.

Coming soon. Watch for it. Write for advance information.

THE YOUNG PEOPLE

Washington's Birthday Party

HERE is the jolliest kind of a patriotic party to give any time during February or in early March. If it is a home party the invitation may be written on a cardboard cut-out representing a small hatchet. If it is a community affair a poster may be made with a patriotic picture cut out from decorated crepe paper and pasted to a bright blue cardboard mount. The invitation may read:

Hear ye! Hear ye!
Come to Washington Headquarters
on February 1st at 8 o'clock.
The Party at Washington Headquarters.

It would add considerably to the effect if the doorway were covered by imitation tent flaps (crepe paper or sheets), one flap to be turned back to admit guests. On one or both sides of the tent stands a Continental soldier, whose costume is made of crepe paper and a cotton wig.

Greeting George Washington

The guest, entering the tent, sees George Washington himself, dressed in a cape and wig, sitting at a small table, writing by the candle light. He does not look up as you enter, but a sentry approaches and explains that if you are to enjoy General Washington's party on even terms with him you must claim previous acquaintanceship; and after a little coaching by the sentry you understand and say, "Oh, yes, I knew George before he had an axe," or perhaps a girl "dried George's eyes after his Dad licked him," etc. The sentry then introduces you to the General, explaining who you are, and George Washington writes down about your former knowledge of him, suggesting that you be seated and think up the details of the occasion in question. This, and watching the other guests, keeps you engaged until all have arrived.

Then the lights in the room are turned on, George Washington places on the floor in the center of the room a piece of cardboard on which is written in large letters, "Campfire," and all are invited to sit in a circle around the campfire. George Washington now takes his list and calls on the guests one at a time to tell in two minutes the story of that earlier friendship with him. If the guests enter into the spirit of it, some very clever and interesting short stories will result.

Blowing Cherries

This is a contest between the girls and the boys at the party. It may be played at this place in the evening, or it may be held until a time when things may lag or drag, as they sometimes have a way of doing, even at the best of parties.

You may depend upon it that ere the game is two minutes old your most conservative and primmest guest will be seen with his head on the floor, blowing at the balloon as

hard as he can in his weakened condition from laughing.

Stretch a string lengthwise across the room at floor level, thus dividing the floor into two fields, girls on one side, boys on the other; nobody may step over the line nor touch the balloon nor be touched by it, or it goes to the opposing side.

A giant cherry (large red rubber inflated balloon) is thrown to the ceiling in the center of the room. When it comes down each side, by blowing only, endeavors to cause it to touch either an opponent or the floor on the opposite side of the line from them. The side successful in so doing puts the cherry into their basket and another is tossed into the air as before.

Many and varied are the decorations for February parties. Our booklets will help you in planning games and making favors.

The side which first gathers ten cherries wins, but the losers will have had so much fun that no consolation prize is necessary.

Crossing the Delaware

The guests are again divided into sides, but mixed sides. One side consists of Washington's soldiers. They take their place at the side of the river (grouped at one side of the room); the other side represents cakes of ice and they place themselves unevenly about the room, so that the soldiers must wind their way around them to cross. However, there must always be room left for a soldier to pick his way around and across between the ice cakes without touching any of them.

The object is for the soldiers to get "across the Delaware" without laughing, and for the ice cakes to maintain frozen faces and not laugh either. One at a time the soldiers try to cross. They have a given time in which to cross; and while crossing, if the soldier succeeds in making any icy countenance melt and laugh, then

that ice cake loses his identity and must go over and join the soldiers' side. But if an ice cake can make a soldier laugh, he has fallen victim to a cake of ice and must join them in the river as another cake of ice.

The same penalty as for laughing is imposed if—

A soldier, through his own fault, bumps into a cake of ice;
A cake of ice is bumped through, there being no path left open between cakes;

A member of one side purposely touches one of the opposing side.

The end of game (usually a quarter to half hour) shows the winning side, of course, by its number. And now, the best of martial charms—The greatest thrill—THE CALL TO ARMS!

One of the Continental soldiers brings a small table or stand to the

A Cherry Tree Made of Paper

Your Drummer boy plays a run-tum-tum. And that will start you dancing soon. 10. I Wear a Cap Size 10. Your partner you shall soon behold. He is a Captain, brave and bold.

Table Decorations

The story of Washington and the Cherry Tree is a favorite decoration. It never fails to delight young and old. Then, too, a cherry tree makes a delightful decoration.

One is in keeping with the "Blowing Cherries" game. A small round box is covered with twisted petals of crepe paper in red, white and blue. A large cardboard hatchet graces the top, with three cherry red balloons to simulate cherries; for the tree branch a mailing tube is wound with brown crepe paper. Candelsticks are decorated with patriotic cardboard cut-outs, and placed around this decoration. Place cards may be balloons with green crepe paper leaves, tied with the ribbon holding the place card. A strip of national blue crepe paper is used for a table runner with a cherry pattern crepe paper border placed in the center.

Another stunning table decoration is to use a patriotic table cover, and make chair backs to match. The chair backs are made by stitching decorated crepe paper into slip covers.

The center decoration simulates a cherry tree as well as the favors. Green crepe paper leaves are cut out, small wads of cotton covered with red crepe paper simulate cherries. Cherries and leaves are wound on heavy wire branch fashion, and then assembled together with extra wires to form a trunk. The trunk is wound with strips of dark brown crepe paper. The box is decorated effectively with cardboard cut out hatchets. Tucked streamers in red and white form a border decoration. The favors may have red gum drops in place of cotton padded cherries.

Little Folks

MY PET HEN

I HAVE a hen named Boots. She is about two years old. When she was a little chick she had her leg broken and I put her in a box in the house. After she had gotten well I let her run into the yard. Each evening she would come up to roost but instead of going to her box she would get upon my brother's shoulder and want to roost there.

After she was older I put her into a coop with some turkeys, pigeons, guineas and other chickens. We called them Boots and her Buddies. All of the other chickens did except Boots and one other chicken. We called it Buddy. Boots will come to us when we call her. She will follow us around if she is very hungry. She lays nearly every day. She is my pet and if anything would happen to her it would make every one cry at home. I expect, as we all like her.

Yola Everett.
Cecil county, Md.

1. "Over 21—Not a Minor"
You'll find your Major very cute.
So when you see him, just salute.
2. "Paint Carrier"
The Color Bearer, who guards the flag,
Awaits you, so find him and do not lag.
3. "Culinary Cop"
Of course when you've danced you are
In for a treat.
Your Kitchen Policeman will see that
you eat.
4. "Postman"
A Dispatch Bearer you should see,
For lithe and fleet of foot is he.
5. "Gas Meter"
Search for your soldier, faster, faster:
He is, it seems, the Quartermaster.
6. "Keep Out"
For pleasure seek the rank and file,
Just watch this private make you smile.
7. "I'm a Nut or Partly So"
At others you may look askance,
For with a Colonel you shall dance.
8. "Trotting My Own Horse"
You shall dance with a bugler gay
When he has sounded reveille.
9. "Traveling Salesman"

Lock Haven; 3, Adam Waltz, Lock Haven.
Binders: 1, S. C. Ramo, Lock Haven; 2,
Hayes Doreyn, Lock Haven; 3, Waltz.
Fillers B's: 1, Lamont Kress, Lock
Haven; 2, Dorey; 3, Ramo.

Penn's Havana Seed

Farmers' Filler: 1, Ramo; 2, Dorey; 3,
Kress.

Wool Awards

First prize and a silver loving cup
awarded by the More Sheep—More Wool
Association of America were won on six
medium wool fleeces by the Susquehanna
County Sheep and Wool Growers' Asso-
ciation. Lawrence County Sheep and Wool
Growers won second, Mercer county third,
and Washington county fourth.

Medium Wool

In the individual exhibits of medium
wool the following awards were made:
Pure-bred ewe fleeces: 1, J. B. Hender-
son, Hickory; 2, W. J. Horton, Clifford;
3 and 4, Fred W. McDowell, Mercer.

Farmer's Business Letter

A GOOD deal of concern is expressed by farmers about the business situation and its possible effect on demand for and prices of farm products. Trade in mid-west towns is slow, as they can see for themselves, and the expense of doing business has not decreased. This is taken as a reflection of general business conditions, which reports indicate are not too good. There is known to be much unemployment. The hope is expressed that there will be gradual improvement. Nobody expects a sharp turn for the better.

Livestock on Farms

The government estimate of livestock on farms January 1 was issued this week. It showed the following: All cattle and calves: 57,967,000 head or 102.7 per cent of year earlier. Cows and heifers: (Two years and over, kept for milk) 22,499,000 head or 102.6 per cent of year earlier. Heifers: (One to two years old being kept for milk cows) 4,660,000 head or 105.03 per cent of year earlier. Sheep and lambs: 48,913,000 head or 103.0 per cent of year earlier. Swine: (Including pigs) 52,600,000 head or 92.5 per cent of year earlier. Horses and colts: 13,440,000 head or 96.7 per cent of year earlier. Mules and mule colts: 5,522,000 head or 98.7 per cent of year earlier.

A sharp decrease in hogs, a steady gain in sheep and dairy cattle, beef cattle about unchanged, continued decrease in horses and mules—the hog figures alone were out of line with expectations.

Hog Futures

It is announced that trading in hog futures, under the sponsorship of the Chicago Live Stock Exchange, will begin March 1. The carload will be the unit. Four grades are specified as follows:

A—Light hogs—Hogs in ear lots averaging not less than 170 and not more than 210 pounds, and uniform in weight and quality.

B—Medium hogs—Hogs in ear lots averaging not less than 220 and not more than 260 pounds, and uniform in weight and quality.

C—Heavy hogs—Hogs in ear lots averaging not less than 260 to not more than 310 pounds, and uniform in weight and quality.

Hogs in the above three classes delivered on future contracts shall not contain single hogs that vary more than 10 per cent from the average weight of that lot.

D—Uneven weight hogs—Hogs in ear lots averaging not less than 200 pounds not more than 280 pounds, and shall contain no hogs weighing under 150 or more than 330, of standard grade.

Observers express some doubt as to the amount of trading there will be. The margin deposit required is expected to be a discouraging feature, from the standpoint of the farmer.

Cattle Decline Further

The cattle market continued to sag this week, particularly on the top end. Heavy steers are now \$1 to \$1.50 lower than two weeks ago, and yearlings \$1 to \$1.25 lower. On the other hand butcher stock was steady this week, to a little higher on the cheaper grades. Best steers again sold at \$16 this week, but the average price of steers, at \$12.35, declined 50 cents from last week, though it was still 35 cents above the average a year ago this week.

The decline this week came in spite of a sharp decrease in receipts. Chicago had only 38,000 cattle, against 50,000 last week, and the run at the seven leading markets was correspondingly short.

Demand for beef is reported to be dull, probably feeding in some measure the slump in employment. Beef is always one of the first staple foods to feel economizing on the part of consumers. There is no other apparent explanation, in view of relatively light offerings of beef, and prospects of continued moderate supplies. The cattle market is sensitive, and is certain to break further on liberal runs. Light supplies are needed to hold prices where they are.

Hogs Again Higher

The hog market registered nice gains this week in spite of a sharp increase in marketing. The eleven leading markets had a total of 770,000

hogs, against last week's light run of 646,000. But eastern orders were good, demand for hogs was active and offerings were promptly absorbed at higher prices.

Average price for the week jumped to \$10, a gain of 40 cents over last week. Quality is good, and weight about normal for time of year.

The hog situation is decidedly bullish, in view of prospects of continued light receipts. Last year there was a sharp advance in hog prices during late January, all of February and the first half of March. The daily average a year ago advanced from a low of \$8.65 early in January, to \$9.70 on January 28, reached \$10 the second week in February, and was at \$11 on February 28. The daily average reached \$11.90 at the high point of the middle of March. Unless something unexpected happens to change the feeling of the trade, it is the belief that a similar upward trend will be seen this year.

Lambs Lose

Lambs were again lower, the decline for the week ranging from 25 to 75 cents. Average price for the week was \$13.05, a loss of 30 cents compared to last week, and \$3.55 under the average a year ago. Lambs, however, are not actually that much lower, due to the demoralized wool market. In fact, in the wholesale market dressed lamb is

Part of the corn and potato show staged by Franklin county farmers in the Chambersburg Trust Company building at Chambersburg, Pa.

now selling at 21 to 28 cents against 26 to 30 cents a year ago.

Receipts at leading points were a little larger than last week, and quite a bit larger than one and two years ago. Expectation of big receipts of lambs to come is not helping the market. Judging from the way lamb prices have been tossed about during the last few weeks, neither buyers nor sellers are certain of the approximate value of lambs. Buyers back away as soon as prices reach \$14.50/14.75, but lambs at \$12.50/13 bring big orders. The situation continues as it has been—"nobody is bullish on lambs."

Weakness in Wheat

Weakness again prevailed in the wheat market, with a slight net loss for the week in prices. Nobody, apparently, expects a wide price swing in either direction. Those on the short side of the market fear that the Farm Board may step in any day to boost prices; and those on the long side feel that large visible supplies, liberal Canadian and Argentine offerings and apparent reluctance of Europe to buy here will prevent any sustained upward swing. Thus the disposition of traders, on both sides, is to cash gains promptly, which holds prices within a narrow range.

Corn was a little lower this week with larger cash country offerings. Farmers are receiving 70 to 75 cents for No. 4 and 5 corn. This they regard as a good price, though some expected more.

Chicago, Jan. 25, 1930. Watson

WOOL MARKET
Boston, Jan. 25.—The volume of business in the wool market during the past week was very moderate and was restricted largely to the finer grades of combing wools. There was some complaint in trade circles about consumption, but if the retailers follow the recent declines fast enough this situation should be remedied.

The egg market in New York was unsettled and generally lower prices prevailed. White eggs ranged from 42¢/44¢ per dozen depending on grade and quality. Brown eggs brought 44¢/46¢ and mixed colors at 35¢/44¢.

The Butter Market
The butter markets were firm early in the week and prices advanced, but with higher prices there was more pressure to sell and this caused prices to decline again. Later in the week prices recovered and there appeared to be more confidence in the situation. Cold weather and storms in widespread sections of the country were partly responsible for the greater confidence. Some dealers believe that this weather will delay deliveries of cream and curd, the milk flow. The consumption of butter has apparently been increased by the lower retail price. Since the lower prices have been in effect chain stores report a considerable increase in the volume of butter sold.

JERSEY WINS MEDAL
Yielding 69.25 lbs. of butterfat and 12,230 lbs. of milk in 305 days, St. Mary's Championess of O. F. a pure-bred Jersey cow in the herd of W. L. Glafberg of Spring Grove, Pa., recently won an all-Jersey Cattle Club Gold Medal for her outstanding record. She made this record in an official production test started when she was six years and five months of age. Her record is the equivalent of 830 lbs. of butterfat and 5,688 quarts of milk in ten months.

St. Mary's Championess of O. F. has made two previous test records. During the second of these tests she produced 69.22 lbs. of butterfat and 12,232 lbs. of milk in a 365-day test winning an American Jersey Cattle Club Silver Medal for her achievement. She was started on this test when a junior four-year-old and her yield is the equivalent of 862 lbs. butter and 5,688 quarts of milk produced in a year.

Philadelphia Produce Review
THE Philadelphia egg market during the past week has been unsettled with sharply lower prices toward the close. While advices from mid-west and Pacific Coast sections indicated very adverse weather conditions affecting collections, never-the-less offerings at terminal markets were somewhat in excess of buyers' willingness to absorb. Dealers were inclined to seek a safer level on which to operate.

Philadelphia Produce Review

THE Philadelphia egg market during the past week has been unsettled with sharply lower prices toward the close. While advices from mid-west and Pacific Coast sections indicated very adverse weather conditions affecting collections, never-the-less offerings at terminal markets were somewhat in excess of buyers' willingness to absorb. Dealers were inclined to seek a safer level on which to operate.

Nearly receipts both at Philadelphia and New York were fully ample and in some cases toward the close of the week, receivers were not able to place receipts, except at concessions. There has been some complaint in trade circles about consumption, but if the retailers follow the recent declines fast enough this situation should be remedied.

The egg market in New York was unsettled and generally lower prices prevailed. White eggs ranged from 42¢/44¢ per dozen depending on grade and quality. Brown eggs brought 44¢/46¢ and mixed colors at 35¢/44¢.

The Butter Market

The butter markets were firm early in the week and prices advanced, but with higher prices there was more pressure to sell and this caused prices to decline again. Later in the week prices recovered and there appeared to be more confidence in the situation. Cold weather and storms in widespread sections of the country were partly responsible for the greater confidence. Some dealers believe that this weather will delay deliveries of cream and curd, the milk flow. The consumption of butter has apparently been increased by the lower retail price. Since the lower prices have been in effect chain stores report a considerable increase in the volume of butter sold.

Poultry

The New York live poultry market was steady with both Leghorn and colored fowl meeting a moderate demand. Receipts of chickens and pullets from nearby sections were light and sold readily. Receipts of broilers by express were larger and the market was irregular. Fancy stock met a fairly moderate demand. Colored fowl brought 32¢/33¢ and Leghorns 31¢. Chickens sold at 24¢/25¢, broilers at 25¢/30¢, and pullets 24¢/25¢. Dressed poultry was steady. Hot house broilers were in light receipt and sold generally at 40¢ per pound. Fowls were firm and in good demand. There were but few nearby roasting chickens on the market and prices were very irregular and depended upon quality.

Potatoes Rather Dull

The potato market in the East was rather dull during the week with the demand slow. Supplies on the city markets increased and low temperatures retarded trading at many points. Truck holdings in New York were 340 cars late in the week while holdings in Philadelphia had mounted to 121 cars. Boston reported 243 cars on track with dealers unable to move much stock on account of the cold. Shipments continued fairly heavy although the demand at shipping points was slow. Maine points reported Green Mountains selling at \$2.25/2.50 per 100-pound sack f.o.b., while New York points quoted

round whites at \$3.85 per 150-pound sack f. o. b.

Pennsylvania potatoes showed little material change in price. In Philadelphia prices ranged from \$2.75 to \$3 per 100-pound sack, in Baltimore \$2.25 to \$3 and in Pittsburgh \$2.25 to \$3.40 per 120-pound sack. Maine stock generally sold at about the same levels as Pennsylvania stock although Pittsburgh reported Maine's at \$3.40/3.60 per 120-pound sack or about fifteen to forty cents above that from this state.

Sweet potato shipments averaged fifty cars daily and the markets showed some improvement on fancy stock. New Jersey yellows were quoted at \$1.50/2.25 per bushel in New York, and at \$1.30/1.90 in Philadelphia.

Apples Slow Sale

Apples continued to sell slowly in both Philadelphia and New York. There was a moderate demand for the best offerings but the bulk of the supply was hard to move. Truck receipts of nearby Pennsylvania, Maryland and New Jersey apples were moderate in Philadelphia but these and the carlot

offerings were fully ample for trade requirements. The best Yorks brought \$1.25/1.75 per bushel, Rome \$1.50/2.25, Delicious \$2.00/2.50, Grimes Golden \$1.50/2.25, Black Twig \$1.50/2.25 and Stayman \$1.75/2.50.

FEED MARKET

The following quotations are for transit and nearby shipment January 24, according to the U. S. Bureau of Agricultural Economics. They show the approximate cost of feed per ton (all in 100-lb. sacks) and grain per bushel in carlots arrival on rail basis delivered on track at Philadelphia and Scranton rate points:
Barley, \$34.50/36; standard middlings, \$24.50; flour middlings, \$36; cottonseed meal, 43 per cent, \$46.50; gluten feed, \$42.50; No. 2 white oats, 57¢; No. 2, yellow corn, \$1.05.

HAY AND STRAW

Philadelphia quotations: No. 2 timothy, \$19.50; No. 3 timothy, \$17.50; sample hay, \$13; No. 1 mixed clover, \$18.50; No. 2 mixed clover, \$17.

No. 1 straight ryegrass, \$16.50; No. 1 wheat straw, \$12.50.

CHICAGO CASH GRAIN

Chicago, Ill., Jan. 27.—The following cash prices ruled here today: No. 2 hard wheat, \$1.21; No. 3 yellow corn, \$2.08/2.09; No. 4 mixed corn, 79¢/79½¢; No. 2 white oats, 45¢/46¢.

Fresh cows, calf at side 50.00/150.00
Choice heavy bulls 10.00/10.25
Choice heavy butcher bulls 10.25/10.50
Good heavy bulls 9.50/10.25
Fair to good bulls 9.00/9.50
Common to fair bulls 8.50/9.00
Inferior bulls 7.50/8.25

Hogs
Monday's receipts were light, 25 double-deck carloads, mostly lambs. The few buyers bidding lower on the better grades of all weights. Bulk of sales was at \$11.75. Top price was \$12.25 for medium weights. Some heavy cattle were held considerably higher. Bulls and sows were steady. Receipts light.

Sheep and Lambs
Monday's supply was about 17 double-deck carloads, mostly lambs. The few sheep went at steady prices, one load of 110-pound wethers selling at \$8.50, the cut at \$6. Lambs were a quarter or so lower, the tops going at \$13.50. Culls ranged downward from \$11.50, or about 5¢ below last Monday's level. Not many heavy lambs are coming but buyers sort them out. They sell at \$11.50/12.50, according to weight, the heavier the lamb the lower the price. Quality of lambs is generally good.

You simply can't get better quality. Why? The reasons are: First, Kalamazoo specializes. Kalamazoo stoves and furnaces are built complete in our big 13-acre factory. We make nothing but stoves and furnaces. Second, Kalamazoo has tremendous buying power—that means purchasing the best raw materials at lowest prices. Third, big scale production enables us to manufacture efficiently at extremely low cost. By selling direct, eliminating all "in-between" profits, you get absolute rock-bottom factory prices. Mail coupon today for new FREE book.

KALAMAZOO STOVE CO., MFRS.
141 Rochester Avenue, Kalamazoo, Michigan

"Received our 'Perfect' in perfect order. We are justly satisfied with it. I am sure I could not duplicate it at any of the stores or factories in Chicago for less than \$150.00 to \$175.00."

Mrs. Benson DeWitt,
Chicago, Ill.

Eveready Layerbilt

"B" Batteries cost only a few cents more and last 25% to 30% longer

LAYERBILT CONSTRUCTION
Here is the exclusive Eveready Layerbilt construction. Only 5 solderings and 2 broad connecting bands, all other connections being made automatically. Waste space eliminated. Layerbilt construction is protected by patent.

CYLINDRICAL CELL CONSTRUCTION
This is a typical cylindrical cell "B" battery. It requires 29 fine wires and 60 solderings—89 chances for trouble. Notice the waste of space between cells.

SUCCESSFUL farmers are economical buyers and their overwhelming choice for Eveready Layerbilt "B" Batteries is based on the fact that Layerbilts offer much longer battery life than any other "B" battery.

Look at the inside construction of the Layerbilt and you'll know the reason why. Eveready Layerbilt "B" Batteries contain unique, patented flat cells and these are packed together tightly, filling all available space. In the Layerbilt you get more "active material" (power-producing elements) than is possible in a battery of equal size made up of individual cylindrical cells.

And these flat cells are not independent of each other, but interdependent. One cell rests on top of the other, with direct contact from cell to cell. This does away with 60 solderings and 29 fine wires, necessary to connect the cells in the ordinary type of "B" battery. You benefit, because the Eveready Layerbilt construction cuts out these 89 chances for trouble.

There are two sizes of Eveready Layerbilt "B" Batteries. Medium Size No. 485 (\$2.95), which will last 25% longer than Eveready Cylindrical Cell Battery No. 772, although it only costs 20 cents more. And Large Size No. 486 (\$4.25), which will last 30% longer than the cylindrical cell Eveready Heavy Duty "B" Battery No. 770, though costing only 25 cents more.

When you buy your next "B" battery, insist that it is one with the Eveready Layerbilt label.

Farm Facts and Fancies

By ALVA AGEE

ALL my life our farm papers have put emphasis on guarding the soil's store of plant food and of adding to it. Certainly too much has not been said, and yet it seems more and more clear to me that we need to place good physical condition of the land first of all. That is the reason why our best farmers in some sections of the East try to get all sod land broken before mid-winter.

Of course some fertility leaches out when frost is out of the ground and rain falls, but the early plowing gives better tilth to some soil, and that is more important than saving the plant food that escapes from bare land. If we cannot have both good physical soil condition and plenty of available fertility, I should choose the former in a farm to be devoted largely to plow crops.

When a soil is naturally loamy, it is easily built up, but a plastic clay sticks to its traditions, no matter how hard we try to make it over. As Bro. Zinn explains to an inquirer, sod land, when fall plowed, has less soluble fertility to lose from exposure to rains, but probably the safe test of the wisdom of fall plowing is its need to afford full exposure of clay land to freezes so that the soil will be more mellow in the spring, and if that occurs there is more profit than there is loss from leached fertility. If I were buying a farm, naturally good physical condition would be rated ahead of the store of available plant food.

Effect of Cover Crops

The growing of cover crops which are plowed down green is good farm practice, but their mellowing effect on a stiff soil is pretty temporary and often slighter than one expects. The trouble is that the material is sappy and rots quickly, and then the soil particles come together again. When the growth is mature, its effect shows for a year or two. That is one reason cornstalks, when turned under, are so satisfactory.

Clover and alfalfa roots usually are two years old, or older, and woody enough to keep a tight soil somewhat open for a year or more. Stable manure, with bedding in it, lasts well in the soil.

All these things, in the case of a stiff soil, have a value exceeding that of the plant food in them. They affect physical condition far more than a large bulk of quite immature stuff.

Effect of Liming

It is usual to emphasize the value of lime in making a close soil friable, and we know that it is so when a heavy application of burned lime is made. The Pennsylvania German farmers knew that a long time ago. Since we have come to the use of relatively light applications of lime I do not believe the effect on physical condition is a very big consideration. There usually is reason enough to use lime without drawing on the imagination, and while there is some physical benefit we cannot depend on a light liming to put a stiff soil into good tilth.

Drainage helps, if there is too much water, and hard freezing helps greatly, and after that our best means of bringing a compact soil under control is organic matter that has a lot of woody fibre in it. Then there are soils so intractable that they are not worth the effort necessary to bring them under tillage, and grass was made to cover them. Most grasses like a compact soil.

Tillage to Keep the Soil Loose

One primary purpose of plowing is to break the soil apart so that air can get into it. Plant roots cannot get along without it. When a close soil has been broken and pulverized, a crop can be started in a satisfactory fashion, but the puzzle comes when

rains pack the ground together at the same time the plant roots extending through the soil.

The shallow tillage of corn potatoes was so emphasized by us a generation ago that we forgot how difficult a compact soil makes conditions for plant roots. Such land we often see roots fail to develop close to the surface, packing rains. We take a middle course between two evils when cultivate deep enough to admit air and yet do not prune roots more than is absolutely necessary. There is a middle course and it takes good farming sense to find it. The nearer we come to converting a clay soil into a more mellow one, less root-pruning after plants start necessary. The soil must have air.

An Ill-Health Suggestion

Our editor once said that he did not think much of converting a paper into a journal of health. An ill-health hint may be a different matter. When one has some ill flesh is heir to, and now and then ill it acquires on its own hook, a doctor is about to be called, it is as well if the call isn't made, may be. In its stead one may get two dozen good oranges, and will make ten glasses of juice. Equipped, he will be ready for a rest five days out of seven, it is reasonable that one's digestion, and then, should have an chance.

The proposed 48 hours fast orange juice usually helps, it is not some think that when one is in such condition that he would be a waste of time for him to try to get well by any other road. It is experience that on the third day one is not as hungry as he thought would be, and it is just as well to confine himself to carrots, and such like, and not eat real food until the stomach has got back to hang of doing its work. The advantage in making carrots a considerable part of the third day's ration is the danger of overeating is eliminated.

A Hand-Picked Route

MOST farmers despise carrying a chicken, a dozen eggs or a quart of buttermilk to a town woman. I fought against the idea for years until failing health made me drop harder tasks for the pattering. I hated to prowl around back trying to find the mistress of the house; I hated to be told to come back next week for my money, hated to have women sniff at my dressed chickens and find fault. I determined to hand pick my customers. If a woman paid promptly and was reasonable, not expecting to drive to her home with six eggs one day and bring something else the next, I carried to her a bouquet from the garden or a few vegetables. I did not really mean much to her. Almost every country garden has many beets, too many radishes and too much lettuce all at once, so I gave her what I had. I had small money value.

My patrons meet me at the door with a pleasant smile, the money ready, for they know my hours. Word of thanks for the little "bouquet," as the southerners call the gift with a purchase, and I have warm friends among them. I drive out occasionally for their things and are "just folks" like the rest of us. By keeping the standard of the food up I can pick and choose what gets it.—Experienced.

THE COVER THIS WEEK

A view of the Lincoln Memorial in Washington, D. C., is shown on cover this week.

Farmers welcome this buying guide to QUALITY in fertilizer

Look for this certificate

Look for this sign of your A. S. A.

Ask your Authorized Swift Agent about Red Steer 7-11-7; 3-12-15 and 4-16-10. Like farmers who have relied on Swift's Red Steer Fertilizers for years, you'll find how well it pays to use them. In case you can't locate your A. S. A. at once, write direct to our nearest plant.

NOW they know the importance of quality in fertilizer, farmers say. They are relying more and more on the Swift Certificate of Quality as their surest buying guide.

For the Swift Certificate of Quality assures: **BEST MATERIALS**—plant food from the most productive sources.

DOUBLE MIXED—fertilizer thoroughly mixed and in good drilling condition so that each plant will get its share of plant food.

TRIPLE TESTED—in fully equipped laboratories. This assures the right kind of plant food in the right form and the correct amount.

Do you know what "guaranteed analysis" really guarantees? Only the amount of plant

food. In addition, the Swift Certificate assures highest quality in plant food.

By using Red Steer bearing this certificate you are assured a quality fertilizer. And quality fertilizer brings you not only bigger yields, but also better quality crops.

Specify high analysis Red Steer and get your plant food for less money. For example, one ton of 4-16-4 has the same amount of plant food in exactly the same proportions as two tons of 2-8-2 and it costs less.

Feed Your Crops!

Crops are like live stock—the better you feed them the more money they will bring. Generous applications of fertilizer produce most profitable returns. Ask your A. S. A. or write the nearest Swift Fertilizer Works.

BEST MATERIALS—DOUBLE MIXED—TRIPLE TESTED

Why Wear Divers' Boots?

You don't need them to
keep YOUR feet on the ground!

NO one but a DIVER would work in a pair of divers' boots. He carries 16 pounds on each foot. He has to, to keep his feet on the ocean bottom. But the MODERN-MINDED farmer does not need such boots to help him KEEP HIS FEET ON THE GROUND. He knows what he wants. He wants a boot that is LIGHT AND COMFORTABLE. He also wants SERVICE.

Through for the day

Still, some farmers think that a boot, to be good, must be heavy. They keep on buying the kind of boots they bought TEN YEARS AGO. Even the kind their fathers used. They keep on coming home dead tired. They are THROUGH for the day.

It is DIFFERENT with the man who wears Goodrich Boots. No lifting of unnecessary dead weight as he works. He is still ALIVE AND ACTIVE at the end of the day.

For Goodrich Rubber Boots are light. They are flexible. And tough. 27 DIFFERENT kinds of rubber compounds and rubberized fabrics give them balance. Certain of the compounds make them flexible. Others make them tough. They are light because each compound is as LIGHT as

Goodrich 4-buckle overshoe.
Light and tough—like
Goodrich Boots

can be and still give you SERVICE—the service hard farm life DEMANDS.

Tire balance in boots

Goodrich Boots balance lightness with service. Goodrich knows the secret of making such boots. The same great research laboratories that have made possible the famous Goodrich Tire made possible the Goodrich Boot. The Goodrich Tire is light, tough, BALANCED. It goes thousands of miles farther than the tire of 10 years ago.

Modern farmers want this same balance in their boots. They want a boot with EXPERIENCE in back of it. Goodrich has over 50 YEARS of tire experience to back up its boots. And don't forget that Goodrich has been making boots, galoshes and rubbers for years, too. You can't beat that combination.

Next time you buy boots, buy Goodrich. PROVE to yourself that Goodrich's years of making tires has helped it to make BETTER BOOTS.

Try out those 27 balanced compounds and fabrics. Let your feet know REAL COMFORT. Give your leg muscles a rest!

Rubber Footwear for Every Member of the Family

NESHAMINY GARDENS

By R. P. KESTER

SOME people think that West Virginia produces little but coal and lumber. The facts are that the state is also important in an agricultural way. Even truck gardening is not unknown there, as the following letter will show:

"We grow a little of a good many things, although we are in the A B C class as gardeners. We have read the National Stockman and Farmer for nearly 25 years, but have known you only since the consolidation of the two papers.

"We have got fair control of the Mexican bean beetle by spraying with arsenate of magnesia. Will try dusting with the same material this year, as it can be put on small patches so much more easily.

"When should White Welsh onion seed be sown to furnish bunch onions early in the spring?

"Do 'hotcaps' scald melon and cucumber plants? How long can they be left on? Will they furnish protection from beetles if they are slit to furnish ventilation? Is hollow-stem in celery caused by holding too long, or is it because of poor seed?

"Last spring leaf lettuce sold for twice as much in May as hothouse lettuce sold for in February. How thick should Grand Rapids lettuce plants stand in the row in field planting?

"Our trade will not buy a large head of cabbage. Ballhead is not dependable here. We are planning to grow a succession of Golden Acre cabbage so as to grow it as late as we can, then leave the market to the fellows who can grow Ballhead. Do you know a better plan?

"We find your page very interesting and helpful." —R.H., West Virginia.

Most of us are in the A B C class in all branches of agriculture, in that there is always something we do not know or understand. In almost every other line of business the fundamentals are more or less fixed. In all lines of agricultural production the factors are variable, so that just when we think we have solved a problem, presto! The conditions are changed and we are at sea again. It is this fact that leads to the saying that "farming is a gamble."

I am glad to know that arsenate of magnesia has been used in a practical way and that it does control the Mexican bean beetle. In many localities this pest has almost discouraged gardeners in raising beans.

We have never raised any White Welsh onions and cannot advise when to plant them. But other kinds require planting at the earliest possible date in spring. It is a good plan to have the ground prepared in the fall so that it is ready for the seed by simply stirring it up before planting. The freezing of winter pulverizes the soil and makes it just as it should be.

What our correspondent calls "hot-caps" are no doubt frames made of two or three-inch strips nailed together, making a frame 12 to 14 inches square, over which some material is tacked. The chief purposes are to increase the warmth by keeping off the cold wind and to prevent attack by insects. Cheese cloth is usually the best material to use. There is no danger of plant scalding when this is used. It gives ventilation, hence slitting is unnecessary and undesirable, else the beetles would gain access to the plants.

Some varieties of celery are more prone than others to grow hollow stems. Another cause may be an excess of nitrogenous fertilizer. We have found varieties of the Yellow

Plume, Emperor and Golden Self-blanching are not inclined to be hollow.

Lettuce, if sown in the field, should be thinned, so as to stand eight to ten inches apart. If grown in beds and transplanted, set the same distance if heads are wanted. Leaf lettuce may be planted closer.

The fashion in cabbage has changed in the last few years. Very few people want the old fashioned heads, weighing ten to twenty pounds now. We have found the Danish Ballhead very satisfactory here, and the Golden Acre is also good. The chief things to keep in mind in growing cabbage is size, solidity and crispness.

I have found conditions in market gardening have changed much in ten years. There is nothing now in being extra early with anything, nor exceptionally late. The business has become so widely diffused over the United States that everything is being grown some place almost continuously, and the methods of transportation are so rapid that the most perishable products can be laid down at our doors in good condition.

My birthday was on the 18th of January, but we had green peas in the pot, strawberries and lettuce. The cost of none of them was more than we get for home grown stuff in the summer season.

Friendly Talks

By Edgar L. Vincent

SOME things get to be second nature with us.

"You are always happy, Ned. I wish I felt that way. How do you do it?"

"I just can't help it, Joe." They were two farmer boys talking together. Joe had discovered something about his friend that caused him to be always in good spirits, and he wondered what it was, wishing that he could be all the time bright and cheery. We laugh at Ned's answer, "I just can't help it, Joe." And yet, somehow, do we not all envy him the cheerfulness of his heart, and hope that it may be so with him as long as he lives?

And why should this not be true with us all? Should we not through all of life's changes maintain an attitude of good cheer? I know we do not always have sunshine without storm, skies without a cloud. This old world we live on keeps whirling around, and as it rolls on it is bound sometimes to pass through a period of cloudy weather, with more or less rain, snow and sleet.

How can we help being overcome by the hard things which overtake us? Here is the ground for one of the hardest battles we have to fight, but if we begin by winning in today's skirmish, the big fight of tomorrow will be easier to gain. And I know of no better way of doing this than by finding some good job and doing it with all one's might and doing it may be grubbing out an old stump, it may be putting one's hand under the elbow of a neighbor who is in hard lines; and it may be just by watching the turning of the furrow as we are plowing and making that the smoothest and best possible. And if we do it this way, by and by being good and kind and true and happy-hearted will get to be second nature with us. "We just can't help it."

1830—The Tale of Nitrate of Soda—1930

By W. W. WEIR

THE year 1930 marks the 100th anniversary in the use of nitrate of soda in the United States. With the exception of lime and guano, this nitrogen fertilizer has probably been utilized the longest of the inorganic substances now commonly used for agricultural purposes. In 1830 but one ton of nitrate was shipped to this country; in 1900, 160,000 tons; in 1914, 606,721; and in 1928, 1,114,337 tons.

Various theories have been advanced to explain the formation of the vast nitrate beds, but none of them is safe from the cold-blooded analysis of science. One of the theories contends that the nitrate territory was once part of the Pacific ocean, but, during a volcanic disturbance, a portion of the water was hemmed in by the land and, as it gradually evaporated, nitrate of soda was formed. Another credits electrical storms for forming nitric acid from atmospheric nitrogen and oxygen which, in the soil, was turned to the nitrate salts. That the beds are the accumulation of drainage from the Andes is the view held by others, while some regard the deposits as the work of bacteria.

An ancient legend credits a tribe of Indians with accidentally discovering the nitrate deposits. In search of new hunting grounds, they were forced to camp on the desert at night. On building a fire they were startled to find that the flames crept through the ground, making a strange hissing noise. The Indians fled, thinking the desert to be inhabited by evil spirits. The chief, however, dispatched his son to tell a missionary on the other side of the desert about the mysterious happenings.

On analyzing the caliche with his crude apparatus, the padre discovered nitrate of soda. Sometime later he was amazed to find that one row of his garden crops was much taller than the others. Then he remembered that the caliche which he had not used in his experiments had been thrown out in the garden. As a result of this discovery he was able to announce to the Indians that the desert, instead of being inhabited by evil spirits, was a gift from Heaven.

This story would not be complete unless it was added that the Indians, unable to find better hunting lands, were saved from starvation by turning to farming, in which, under the leadership of the chief's son, they were able to renew the fertility of their soil by the use of nitrate of soda.

It used to be a popular pastime to speculate on the exhaustion of the nitrate beds. Some gloomy individuals foretold the time the deposits would be exhausted with as much courage as others have forecast the end of the world—and with as much error. According to geologists and engineers, who have carefully studied the nitrate fields, the present deposits are adequate to supply the needs of the world for many centuries to come, even though the present rate of consumption should be materially increased.

In its natural state, nitrate of soda is found in a stratified ore called caliche. It occurs only on a barren plateau in the Andes mountains of northern Chile, in an area that is about 450 miles long and which varies from 15 to 90 miles in width. The ni-

trate zone is as desolate as a desert, for it is entirely destitute of vegetation, water and fuel. The principal layers of caliche are found about three feet below the surface. It varies in richness from five to 70 per cent of sodium nitrate.

The extraction of this raw material is comparatively simple. The surface is broken up, usually by dynamite. In some instances steam or electric shovels are used for removing the layers of the earth covering the caliche and also for extracting the caliche itself. In other cases more primitive methods are used, even hand drilling, although

the model dwellings erected by the companies for the operarios, or workers, and the whole industrial community. About 70 oficinas are now in operation.

Recently a new process has been introduced into the industry on a large scale by American capital. It recovers about 90 per cent of the nitrate contained in the ore, as compared with about 55 per cent under the old process. In addition it permits the treatment of ore averaging as low as eight per cent sodium nitrate, contrasted with 15 per cent required under the old methods. By this step, alone, this new process has doubled the life of the deposits in Chile, for prior to its introduction, low-grade ore was cast aside and only the selected, high-grade material was treated.

The American capitalists now have in operation a plant based on the American idea of mass production. It produces 500,000 tons of nitrate of soda annually, as against 150,000 tons which represents the maximum production of the largest plant using the old methods. Every operation in this new plant typifies the latest American methods. As a result, one laborer working under this new process replaces three to four under the old, and one ton of fuel oil does the work of four to five tons under the old methods.

The product from this process is a pure white nitrate of soda containing about 99 per cent sodium nitrate. It is in the form of even-sized, shot-like granules, which may be easily applied to the field. Costs have been greatly reduced, as against the old methods, which in the end will mean steadily lowering prices for nitrate of soda to the consumers in the United States.

As found on the market, Chilean nitrate of soda ranges from red and dull grey to pure white in color, and is uniformly fine in texture. It is immediately soluble, one part dissolving in one part of water. It contains from 96 to 99 per cent sodium nitrate and more than 15 per cent elemental nitrogen. In this form it may be applied directly to crops or be used in a mixed fertilizer with equal facility and effectiveness.

Among American farmers, nitrate of soda is known by various names, such as Chile saltpeter, "soda," Chilean nitrate, and to some extent in the southern states as "guano."

Original Mine.—In 1818, George Smith, an Englishman, near Iquique, then Peru, opened on a commercial scale the first nitrate of soda mine. Two years later, small quantities were shipped to England, but were dumped overboard because of the high duty. In 1827, efforts were again made to introduce it into Europe, but without success.

First Importation.—One ton was delivered in New York in 1830, but, as its value was unknown, no sale was found for it. Shipments to both England and France were made the following year, nearly 8,000 tons being exported.

A picture of early farm life in America has been preserved for us by C. W. Marsh, inventor of the Marsh harvester, who in "Recollections of 1837 to 1910" describes conditions on his

Tugs which carry nitrate of soda to large ships.

these have been largely replaced by mechanical drills. The raw material thus mined is transported to a central refining plant. This is done by means of mule-drawn carts and light railways with steam locomotives. At the central plant the caliche is first crushed and then leached in huge evaporating pans. The recovery of the nitrate follows, after which the product is dried, sacked, and loaded on the cars for transportation.

A nitrate plant is known as an "oficina," though this term is sometimes restricted to the works. Actually, an "oficina" means not only the central plant where the raw material is precipitated and leached, but the complete establishment—the area which is being mined, the railway and other transportation equipment, the administrative offices,

A nitrate plant on Chile's barren desert.

WOOD GAS

LAST fall a Swedish army truck, five and one-half tons, ran 144 miles in seven hours on the gas it generated en route from 297 pounds of waste wood chips. The total cost of the chips was 80c, while the cost of gasoline for a similar truck over the same route was five times as much. Evidently the possibilities of wood in industry have not yet been exhausted.

MRS. W. D. ZINN

AS we are about to close this issue a telegram informs us of the death of Mrs. Florence Swearingen Zinn, wife of our old friend and associate W. D. Zinn. She died at their home in Philippi, W. Va., on Sunday, February 2, after a long illness. We shall attempt no tribute to her here, as one will be found in the next chapter of the Story of Woodbine Farm. Mr. Zinn has the sincere sympathy of thousands of real friends.

NORMAL PRICES

NO doubt there are several things accountable for recent recessions in prices of livestock, but the fact that many consumers cannot buy freely at high prices is one of them. This side of the market is always an unknown factor until it becomes manifest in the course of business. Some authorities attempt to account for such changes by saying that prices are seeking a normal basis, but what is normal? We have never found anybody able to answer that question.

A FAIR SUGGESTION

AT the meeting of the Pennsylvania Association of County Fairs last week a county agent, L. F. Engle of Greene county, made some valuable suggestions to the managers. He showed that the classes provided for livestock and poultry waste a lot of money because many of these classes do not represent breeds useful in the fair's territory. He cited fair catalogues which offer premiums for 120 to 160 varieties of poultry, most of them not of service to the farmers of the community. He showed that some fairs offer prizes for breeds of livestock that have no place in the animal industry of that region and can have none. Mr. Engle did not advocate reduction of the amount of money devoted to livestock or any other part of agriculture. He believes in more money for the breeds which are useful to the people and less for the professional showman who carries many breeds merely to take advantage of this weakness of the fairs. Many other points of interest to fair managers were discussed, among them the abolition of passes and the

experiment of free fairs, both of which have been successful in some places.

DEFERRED JUDGMENT

THE Chamber of Commerce of the United States has decided to defer passing judgment on the operation of the Agricultural Marketing Act "until there is more definite evidence of its actual effect on private enterprise than at present is available." If the sole basis of the Chamber's judgment is the effect on private enterprise probably this course is correct. But some things are commercially wrong and the Chamber should have the courage to say so at any time. The policy of lending public funds without adequate security is clearly wrong no matter how benevolent its intent. The policy of market manipulation or virtual price-fixing, financed by public funds, is likewise wrong regardless of its purpose. The policy of creating and financing with public funds organizations to speculate—buy, hold and sell—is all wrong too. Why not have the sense and the sand to say so now or any time?

FARMING IN INDIA

IN reviewing his farm operations for 1929 Sam Higgenbottom, Principal of the Allahabad Agricultural Institute, says: "At one time we suffered from lack of rain, a month later from excessive rain, then from drouth again. The crows, green parrots, rats, jackals, foxes and porcupines left us about one ear of maize out of three. In order to get this much it had to be harvested before it was fully ripe. We had three men pumping calcium cyanide gas into the holes of rats, porcupines, foxes and jackals. Two men with shotguns used hundreds of cartridges. My son Henry's record shot was eleven green parrots from one cartridge." In spite of all natural or seasonal conditions in "a bad year" Sam reports a "comparative success" in farming and says that the Institute's farm "demonstrates what we are here to teach and is an open page which any book-illiterate farmer can read."

THE AGRICULTURAL OUTLOOK

ON another page of this issue is the official summary of the agricultural outlook for 1930 as prepared by the Bureau of Farm Economics, the colleges of agriculture and the Federal Farm Board. In practically all major lines of production the outlookers either directly or indirectly warn against increases. The exceptions are flaxseed, rice and broom corn, none of great interest to the producers of this region. We cling to the idea that it is not the proper function of any official body to make such predictions and give such counsel. We believe that it is the proper function of our officials to give correct information, leaving its interpretation to those who are financially interested in and responsible for production. We believe, moreover, that the composite wisdom of those thus responsible is better than the opinions of those not so responsible. Fortunately the outlookers do give us some interesting information; and, fortunately again, farmers are not paying much attention to their advice.

MARKET THINKING

THOSE who propose legislation against short selling remind us of a speaker who charged that foreign wheat buyers depress our market by selling short millions of bushels, so they may buy on the lower basis they thus create. We asked him how much wheat such a man would have for exportation if he sold a million bushels short and bought a million bushels later. His answer showed that he forgot the important truth

that every short seller must become a buyer of the amount he sold. He overlooked the fact that this operator would not have a bushel of wheat to export until he had bought a million bushels to cover his short sales. Many persons who have not studied our exchange system of marketing fail to appreciate the service the short seller is compelled to render because he is compelled to buy. They forget that such buying is just as important an influence one way as selling is the other way. They think and talk of the amounts sold, forgetting that just as much is bought as is sold and vice versa. Our market thinking would be clearer if the systems so frequently denounced without study were studied. They deserve study, for they are the result of the experience of the world's best business men.

FROM LIFE

A FEW years ago a certain man died leaving a considerable estate. Among his holdings his executor found securities with a face value of \$125,000 but of little market value. He sold the lot for \$5,000 and it proved to be worth even less than that. This is an extreme case no doubt; but of what value are the securities of carriage factories, breweries and distilleries, most organ and piano factories, obsolete traction companies, oil and gas companies without production, mining companies with exhausted mines, mercantile houses no longer needed in modern business, etc.? Most of the securities this man left had once paid dividends but new inventions and business changes had left the companies without capacity to earn money. The capitalist must face risks just as the rest of us do.

HOG FUTURES

THE experiment of future trading in hogs begins at Chicago March 1st. Rules to govern such trading have been approved by the Packers and Stockyards Administration. These rules provide for a clearing house to supervise the trading and to make any necessary adjustments in it. Three deliveries are provided for—"spot," under which delivery is made the day of sale; "to arrive," under which delivery must be made within seven days; and "futures" under which delivery may be made, at seller's option, on any business day of the month specified. The carlot of 16,500 pounds is the unit of trading and four classes of hogs may be specified in contracts for future delivery—light, medium, heavy and uneven weights. Further details of the plan will be found on another page of this issue.

It is evident that the rules apply to Chicago and other western markets rather than to eastern markets, where hogs classed as light weigh less than 170 pounds, but probably no future trading is to be expected in the latter markets under any circumstances. To make this system effective at least three classes of traders are essential: (1) Producers or shippers who may insure their future price by selling for later delivery. (2) Packers or dealers who insure their future supply and price by buying for later delivery. (3) Speculators ready to buy or sell at any time and so furnish opportunities for the other two classes to buy or to sell. Thus far the probable course of the packers has not been indicated. It may depend somewhat on their ability to make future contracts for hog products. There is some question also whether a group of speculators, such as operate in grain, cotton and other markets, will arise to operate in hogs. Probably this development will take time, and too much should not be expected in the early days of the new system. One thing appears certain—that the new system will be denounced as gambling in hogs if it ever amounts to much.

NEW JERSEY potato growers are already beginning to wonder to expect from the potato sections in 1930. The potato acreage in New Jersey has gradually been decreasing since 1925, and growers are advised to maintain the acreage of the year. The early potato section is not as well stabilized as the sections of Eastern Shore. The crop may have up to 100 bushels per acre. The best to New Jersey is from the "Many Potatoes," which can directly make statements to provide food for the year 1929 over the normal growth, some more economical method for more investment in the market debacle in 1929. There is only one outstanding concern: 1929 was a potato year and the market was not, and the banking elements offer final proof necessary, of that nature.

Every intelligent man on the Shore has the reasons for success of 1929. The failure of the market has been over and over. Short courses have been held to him. Federal Farm has advertised for him, the range and independent dealers have been written every known fact of dissemination. Every farmer knows to increase acreage this year will be his own ill-doing. Also knows that only way for the acreage of to be maintained for each farmer, the large or small, to cooperate. We ask again the question: "How many hogs in 1930?" Farmers must answer, and it will soon be for them to answer. And upon the answer hinges success or the failure of the year. We hope it will be not to increase the potato acreage."

THE selection of good hogs emphasized by foreign buyers in purchasing has inclined to select more than within the desired animals. The records completed by the American Association of Hogs and Poultry Raisers presented by the advanced figures in the yearly dividend. The average of 5 pounds of butterfat per hundred pounds of live weight and yearly dividend of 31.392 in number of yearly records averaged 56.8 pounds of fat in 347 days. In the averaging 14.13 pounds of butterfat, and these figures clearly

NEW JERSEY potato growers are already beginning to wonder to expect from other potato sections in 1930. The potato acreage in this state has gradually been reduced since 1925, and now growers are advised to retain the acreage of the year.

Other early potato sections are not as well stabilized as New Jersey. The effects of Eastern Shore growers and the effect of crop may have upon the market is always of interest to New Jersey potato growers. The following editorial from the Eastern Shore News, "Many Potatoes," presents one of their problems which can directly affect our growers:

"Banking statements published two weeks ago provided food for thought for Eastern Shore growers. An increase of \$1,592,499.33 in deposits for the year 1929 over the year 1928 was the cold revealed. Without doubt some of that increase in normal growth, some of it may have been due to more economical methods, a good strawberry crop or more investment. On the other hand the market debacle in November and December probably lowered the total of deposits. To the extent there is only outstanding condition: 1929 was a potato year and 1928 was not, and the banking statements offer final proof if final proof necessary, of that condition.

Every intelligent grower on the Shore knows the reasons for success of 1929. They have been over and over. Short courses have been held to impart them upon him. Federal Farm has advertised facts for him, the range and independent dealers have read him, editorials have been written every known fact of dissemination. Every farmer knows to increase acreage this year will be his own ill-doing. He also knows that the only way for the acreage of to be maintained for each farmer, either large or small, to cooperate. We ask again the question: 'How many does in 1930?' Farmers must answer and it will soon come for them to answer. And upon answer hinges success or the failure of the year. We hope it will not increase the potato acreage."

Selection of good herd sires has long been emphasized by foremost dairymen and breeders. In purchasing herd sires buyers frequently inclined to select them from distant places rather than within their own state. The thought desired animals cannot be found in the home state is not necessarily true and is proved by the records completed in the 10-month and yearly divisions of the advanced register of the Holstein Association for New Jersey. Figures presented by W. R. Robbers, who has charge of the advanced registry work in the state, show in the yearly division a total of 119 animals produced an average of 15,712.5 pounds of milk, 5.56 pounds of butterfat, and 3.39 per cent fat. Advanced registry records completed in the 10-month and yearly divisions over the entire country show 31,392 in number. Of this number 23,639 yearly records averaging 16,703.6 pounds of milk, 5.56 pounds of butterfat, and 3.39 per cent fat in 347 days. In the 10-month division 7,753 averaging 14,139.4 pounds of milk, 476.4 pounds of butterfat, and 3.37 per cent fat in 298

These figures clearly prove that there are many

good foundation animals of this breed in New Jersey. And a buyer selecting a herd sire within his own state has an opportunity to see the animal and its dam.

ONLY ten per cent of all the fluid milk sold in the New Jersey Metropolitan area is sold as raw milk according to a survey of the New Jersey Metropolitan area made last year by the Experiment Station. It was also found that six per cent of all milk going into this area is on the direct haul basis.

A little over a year ago a complete survey of all the dairy farms in Hunterdon county was made by the Experiment Station under the direction of Professor C. B. Howe. In this county it was found that nearly one-half of the herds contained less

than one inspection service while 6 per cent were missed entirely. He pointed out that this duplication of inspection was probably one of the most deplorable practices in the territory and that the only solution for this problem was a uniform health code.

An effort is being made by the Dairy Advisory Council in New Jersey to work up a uniform code at the present time.

A SPECIAL one-week course in the testing of milk and its products is being offered at Rutgers to dairymen, creamery inspectors, herds- men, and others interested in the work. This course, beginning on February 17, prepares students for the state license examination for operating the Babcock test for milk, cream and ice cream.

A COURSE in turf management, designed to meet the needs of greenskeepers, members of greens committees, estate managers, and others who are interested in knowing how to maintain lawns and turf in the best of condition, is again being given at the college of agriculture at New Brunswick beginning on February 24.

The increasing need for training of this kind was apparent last year when the course met popular approval and 54 students took the one-week course.

THE Eastern Guernsey Breeders' Association held their twenty-seventh annual meeting last Friday at the Hotel Adelphia in Philadelphia. Here members of this old breed association again gathered, not for business purposes alone, but to renew friendships.

M. M. Hollingsworth, who has been secretary of the association since its birth, was again re-elected to that office. E. T. Gill of Haddonfield, N. J., was elected honorary president; Walter Smedley of Media, Pa., president; G. H. Hibbard of Brookville, Md., 1st vice-president; H. G. Haskell of Wilmington, Del., 2nd vice-president; and M. E. Leeds of Philadelphia, Pa., treasurer.

Robert Scovell, President of the American Guernsey Cattle Club, was present at the meeting. Mr. Harry Hayward presented to the breeders some thoughts to keep in mind when selling breeding stock. He pointed out the fact that most herd sires

are purchased on the merits of the dam's production record.

THE 989 pullets comprising the Vineland Egg-Laying Contest established a new high record during the sixteenth week by laying 4,726 eggs for a production of 68.26 per cent. This is the fourth consecutive week that a new high record has been established in the Vineland competition. Last week's production was 68.19 per cent.

Four New Jersey-owned flocks are listed on the honor roll of high scorers for the sixteenth week. Louis E. Schaible's Rhode Island Reds from Shiloh, with a lay of 60 eggs, stand second on the honor roll. Two pens of White Leghorns owned by C. W. Brown, Vineland, and E. J. Rubright, South Sea- ville, each laid 58 eggs to tie with a Pennsylvania entry for third place. Another flock of Leghorns from J. D. Eno's Grasmere Poultry Farm, Vine- land, laid 57 eggs to tie with a Michigan entry for fourth place.

The Woodview Poultry Farm entry of Rhode Island Reds from Mount Holly, with a score of 827 eggs to its credit, ranks first in total production among the New Jersey entries in competition.

New Jersey Farm Comment

By G. W. HARRIS

Master Farmers of 1929

HERE are the Pennsylvania, Delaware and Maryland farmers who received the Master Farmer Award for 1929 at a dinner given in their honor in the Ballroom of the Penn-Harris Hotel in Harrisburg on Thursday evening of State Farm Products Show Week. The group also includes the New Jersey Master Farmers who received their gold medals during Farm Week in Trenton a week earlier. Nearly 350 persons attended the Harrisburg dinner as guests of the Pennsylvania Farmer.

Standing, left to right: Charles F. Preston, Lancaster county, Pa.; Guy L. Hayman, Chester county, Pa.; Henry F. Garber, Lancaster county, Pa.; Ray C. Norman, Harford county, Md.; Franklin G. Rue, Monmouth county, N. J.; James Ewart, Middlesex county, N. J.; Alfred Sloan, Salem county, N. J.

Seated, left to right: Norman E. Rishel, York county, Pa.; George M. Anthony, Berks county, Pa.; Guy A. Leader, York county, Pa.; John D. Reynolds, New Castle county, Del.; Harvey C. Kreitz, Crawford county, Pa.; C. E. Bauer- master, Somerset county, Pa.

First row: John C. and Andrew T. McDowell, Mercer county, Pa. At left is Samuel L. Smedley, Jr., Delaware county, Pa.; at right, Charles Fitting, Atlantic county, N. J.

than ten cows, and that the biggest single problem in making a high quality milk which would be put on the direct haul basis, is lack of cooling facilities. The northern part of Hunterdon county showed that 20 per cent of all dairymen were using a tub in which to cool their milk, 70 per cent were using well or spring water and 10 per cent were using ice. In the southern part of Hunterdon county, which included all the county except Readington, Clinton, Tewksbury and Lebanon townships, only three per cent of the dairymen were using ice, 43 per cent used the tub or still water method while 50 per cent used well or spring water.

In the four northern townships 12 per cent of the dairymen reported milk rejected for some cause or other during the year while 23 per cent in the Southern section reported the rejection of milk. Professor Howe pointed out that one of the biggest factors in this situation was the lack of a uniform health inspection. He found that in the four northern townships and part of Warren county one-third of the dairymen reported more than one inspection service while 20 per cent had no inspection service. In the southern half of the county 57 per cent of the dairymen reported more

A vital decision in the popular pastime of "barnyard golf."

Put New Life Into Your County Fair

By BETTY ECKHARDT

DOES your fair need a "doctor?" Take West Virginia's advice and try a little home talent entertainment. They know from five years of experience that the way to win the interest of the people in the fair is to give them a part in it!

Five years ago county fairs throughout the state faced the problem of decreasing attendance in spite of the "bigger, brighter and noisier carnivals," and more expensive free acts. A few secretaries were brave enough or perhaps desperate enough to invest a little of their "free act" money in home talent entertainment. Since that time thirty fairs have included some home talent in their programs and the objectionable features of the carnival have been largely eliminated.

Pocahontas county boasts of a fair "built on Community Pride not Prizes." Each one of the four districts acted as host for one day at the fair and provided the "free acts." The people themselves acted as judges and at the end of the week each district had its own opinion as to "who put on the best show," so everybody was happy!

A "Fool-Proof" Free Act

"The Old-Time Singing School" put on by Huntersville District at the Pocahontas Fair was one of the big hits. The singers were well prepared, for they had practiced in their community chorus throughout the winter and spring. No costume house was necessary in dressing up for the affair. Almost every attic in the district had a gay Easter hat of the late nineties or a dress with "leg of mutton" sleeves or a cut-away coat from somebody's wedding or a derby that had escaped being sat on. The enthusiasm with which this "act" was received was so great that the carnival manager was about ready to take them "on the road" as a "big attraction."

Try a Circus Day Parade

When a substantial livestock farmer turns into circus manager and wears a high silk hat; when the minister's wife acts as gypsy fortune teller, and you are conscious for the first time of the sparkle in her eye; when you can recognize the grocer's bow legs as the hind legs of the elephant; what commercial free act can compete?

The whole neighborhood joined in making the circus day parade a success. The school band, a little more gaily attired than usual, led off. Most ferocious lions (in labeled cages so that there could be no mistake), monkeys, elephants, giraffes, snake charmers, gypsy fortune tellers, "fat ladies," tall men (on stilts), bearded women, and "freaks" of all kinds passed in review. The parade also gave a splendid opportunity to show off the educated pony which could recite count and dance, pet rabbits and guinea pigs, the goat that could pull a little cart, the wild animal trainer with his pet crow and "Billy Coo" and every extraordinary thing in the neighborhood. No "real circus" was ever greeted with so much en-

thusiasm or spoken of so many times afterward. On the "mid-way" the Little Theatre was the most popular side show. Twenty-minute shows brought in an astonishing number of dimes. The talent included short plays, minstrels, choruses from high school operettas, folk dances, drills, amateur "magicians," tumbling, quartettes, small orchestras, and solo numbers of various kinds. This made an excellent place too for the old fiddlers' contest and the demonstration square dances and jiggling contests. The only problem was that of getting the people to go home at night after the invitation for demonstration square sets from the audience was given.

Night Events

Few people will ever forget the beautiful night pageants in front of the grandstand. Most of them were built around local history by the people themselves. The one which portrayed the Pocahontas and John Smith episode was written by a direct descendant of Pocahontas and several of the great, great, great "grands" were in the cast.

Pocahontas folks were strong advocates of games of skill, but not of the carnival variety. They prefer to see who is the community champion at horse shoes or which district team can surpass in soccer, football or baseball, or which fisherman can win in the casting tournament.

Fine saddle horses are still quite plentiful throughout the county and the fair brings out the best of them. Of course there are the usual horse races, but there are classes too for the farm saddle horse that can jump ditches and open gates. There are gentlemen's saddle classes also and ladies' saddle classes and special classes for boys and girls. Old-time riding tournaments where the winning knight crowns the "queen of love and beauty" are being revived.

Potato races on horseback prove to be even more thrilling than professional polo games.

The carnival hasn't been eliminated entirely, but it has changed its "stripes" so that it really shouldn't have the same name as the old gambling.

"Barnyard Golf" Makes a Splendid "Free Act."

The county champion. He plays "Turkey in the Straw," "Sour Wood Mountain," "Cluck Old Hen."

"girl show" variety. They carry "rides" for adults and special ones for children and a variety "games of skill" for some of the "smart alecs" "cut their eye teeth" on. The carnival managers are delighted with the large crowds that talent brings to the fair and are glad to cheer up and give the people what they want.

The most significant thing about West Virginia fairs is that they form a splendid means of encouraging a fine type of recreation program throughout the whole year. Choruses, drama groups and music groups practice diligently during the winter and hold local contests to see who will play at the fair. As soon as spring opens "barn yard golf" is the most popular pastime around the country store. Soccer football and baseball leagues begin early in order to be ready for the fair.

West Virginia has proved that in order to be successful a fair must be a "people's fair." Exhibits must include the best in music, dramatics and athletics as well as the best in agriculture and home making. Secretaries have agreed that all of this kind needs no "rain insurance."

The Agricultural Situation

THIS has been a very fine winter day. The ground is frozen well. Three or four inches of snow lies everywhere. The thermometer near zero at daylight, but responded admirably to a bright sun and by noon the temperature was only half a dozen degrees under freezing.

The countryside is prolific of whole fields of still in the shock. Manure piles may be seen the hundreds. Most woodlots have visible fat trees scattered about. Not a fodder stack nor commendable supply of neat fodder shocks for feeding at the barn were to be seen in a day of thirty miles. Nobody at all in the country seemed to be working, teams everywhere seemed to be softening up in the barns and around straw piles.

It is flagrantly impolite to call attention to one's condition of affairs. In ring parlance one might be accused of striking.

On a farm in southeastern Wisconsin, the county farmer below the line dug up a square foot of quack grass and weighed the infested soil and weighed the roots. After they had been dried and weighed the roots weighed over 2½ ounces. The farmer doesn't seem like much but mulch it by 43,560 square feet in an acre and it amounts to more than 100 tons of roots on one acre of land. The county agent figured that each ton of quack took \$5.30 worth of plant food from the soil. On this basis was \$18.55. That's an example of what it costs to feed a quack crop of quack grass. A cultivator equipped with spring teeth was used on this farm to check the quack.

The University of New Hampshire announced just recently a method of killing quack grass which they have found successful. They used a special spring-tooth harrow which lifted rootstalks out of the ground and brought them to the surface to dry out. To start at the beginning, they first plowed the ground immediately after haying. That was in 1928. Every ten days or two weeks during the winter months they used the special weed harrow and gradually worked the weeds out of the ground. Since then they have had no trouble with quack grass.

The men who conducted this test in New Hampshire say that they consider the special spring-tooth type of weed harrow much more efficient than quack grass than the ordinary spring-tooth harrow or the disk harrow. These other implements have their place in preparing the seed bed, of course, but they were not designed to control quack.

A field cultivator equipped with stiff teeth is an efficient weed destroyer.

Machinery to Kill Weeds

By BERT S. GITTINS

harrow or the disk harrow. These other implements have their place in preparing the seed bed, of course, but they were not designed to control quack.

Here is the way one large operator in the Northwest cleaned up a farm which was literally overrun with quack grass. He first plowed the ground to a good depth—six or seven inches. Then he harrowed as often as possible, first lengthwise of the furrows so as not to tear up the sod. After the soil was well pulverized, he started harrowing crosswise. He used a spring-tooth type of quack grass harrow, going a little deeper each time over and bringing more roots to the surface. Whenever possible he tried to harrow when the weather was hot and dry so that the sun could have a better chance to kill the quack grass rootstalks.

Storehouses of Food

Rootstalks of the quack grass plant are really storehouses of food. They grow much like runners on a strawberry plant except that they stay

A spring-tooth type of harrow digging out weeds.

underground, and new plants spring up from the nodes or joints in these rootstalks. Quack also spreads by means of seed but it is these underground stems which cause the most trouble.

Quack grass isn't the only serious weed pest, however. All weeds are bad enough, but some of the worst are Canada thistle, sow thistle and bindweed. Dr. L. H. Pammel of the Iowa Experiment Station considers Canada thistle the worst weed in his state. For this weed and others similar to it, Dr. Pammel recommends deep plowing in July or August, harrowing with a spring-tooth harrow and then raking and burning the roots. Next, he says to smooth the ground with a disk, and harrow once a week until freezing weather. More harrowing can be done in the

spring until time to put in the following crop, which should preferably be a heavy smothering crop like Sudan grass or sorghum.

It might be well to say something about the new harrows and cultivators which appear very promising in the control of noxious weeds. The field cultivators were first used in the wheat country for killing weeds in summer fallow. Out there they are called "duckfoot" cultivators because they are often fitted with wide-nosed "duck-foot" shovels which

are especially suited to shave off weeds. These field cultivators range in size from six to twelve-foot widths. The teeth are carried on a strong frame supported by wheels. These cultivators may be fitted with either spring teeth or stiff shanks equipped with various types of shovels.

The harrow type of weed killer is similar to a regular spring-tooth harrow except that the teeth are designed to point forward and to lift weeds and roots out of the soil.

Other types of implements have been used successfully at times to kill weeds such as quack grass, the one-way disk for example. But no matter what tool is used, killing out quack grass and similar pests takes a lot of time and work. Once or twice over the field does little good unless the job is continued. Use of the right kind of tools naturally makes the work quicker and surer.

Tests with Chemicals

CHEMICALS for killing the more aggressive perennial weeds have been attracting considerable attention in recent years. Sodium and calcium chlorates seem to give the most encouraging results, although there is still much to be learned before they can be recommended with confidence for all conditions. Comparatively small amounts, 100 to 200 pounds per acre, of these chlorates, dissolved in water and applied as a spray, seem effective in killing the foliage. They also seem to penetrate the root through the plant tissue and have a poisoning effect which may result fatally.

In some tests the use of 300 pounds of sodium chlorate in one season has not seemed to interfere with the growth of a crop the next year. In other cases, especially the past dry summer, 200 pounds applied the year before seriously injured corn and potatoes. Sufficient amounts of oil, salt, or arsenicals to secure the same results in killing weeds would render the soil infertile for several years.

There is a fire risk involved in the use of sodium chlorate. Calcium chlorate mixed with the sodium chlorate renders it very deliquescent and removes this risk. Such a mixture is being sold for weed eradication.

In Kansas experimenters secured almost complete control of bindweed by three applications of 100 pounds per acre of sodium chlorate as a spray dissolved in 100 gallons of water. The applications were made at intervals of about three weeks, or as often as the renewal growth attained a length of six inches. In New York fairly good control of Canada thistle was reported from a single application of 150 to 200 pounds, either wet or dry. However, on the larger and more aggressive type of Canada thistle, which is attracting unfavorable attention in Pennsylvania and Ohio, two or even three liberal applications have not always been successful.

J. B. R. Dickey.

"I CAN'T explain now," said Toots. "But you come with me and you'll see something. You won't get into trouble. I'll do the talking and all you need to do is to stand around and watch what happens."

If not perfectly reassured Hoskins' curiosity at least was sufficiently excited and he concluded to accompany Toots to the store. Within a few minutes they picked up Steve Harte and Phil Franklin, whose interest Toots piqued by the same method that had been successful with Hoskins. After that, having a nucleus of four, it was an easy matter to enlist other recruits and by the time the store was reached the crowd, like a snowball rolling down hill, had magnetically attracted to itself a number of persons who hadn't the least notion what the stir was about. Something seemed to be on foot, otherwise there wouldn't have been any crowd, and this was a good enough reason for tagging along.

Toots entered the store while his mystified and rather uneasy followers halted before the steps. Tigert happened to be alone at the moment, and hearing the door open, laid down the newspaper he was reading with the brisk air of the efficient salesman, but sank back into his chair doggedly as he recognized the visitor. An expression of uneasiness passed across his face, which immediately became fierce. He pointed to the door.

"Get out o' here," he said harshly. "Want me to throw you out again?" he started to rise.

"I'm not alone, Capt'n," smiled Toots. "There are about twenty friends of mine who are coming in when I give the word. They've got an idea there's something worth seeing here—where you keep the Red Mill flour, maybe."

Tigert started as if he had been pricked with a pin and his eyes wavered furtively. "What d'yer mean?" he stammered thickly. "Friends o' yours—comin' in—in yer?" He moved toward the window in a kind of crouch and took one look. His leathery yellow cheeks went ashy.

"I'm going to ship tonight with Capt'n Crumb and I reckon I won't have another chance to come for my two hundred," observed Toots meaningfully.

Tigert seemed to weigh this with frowning concentration for a tense moment. Then he walked to the safe and opening it, took out the envelope in which the money had been placed. "I was plumb mad then," he said as he handed it to Toots. "But I never meant to keep it. You know that, don't ye?"

Toots ran over the bills, finding the amount correct. He went to the door and as he put his hand on the knob Tigert, clearing his throat, spoke again: "You aint aimin' to have no trouble with me, are ye? It might prove right serious for you, sonny. You got your money an' that makes us square, eh?"

"Think you're square with the town, Capt'n?" retorted Toots.

HE went out quickly. The crowd was already pretty restless and showed an inclination to melt away. Some of them were grinning foolishly. They had come to the conclusion that the joke was on them. Hoskins called out:

"Well, what's up? When does the show begin?" "Why, I'll tell you-all," said Toots. "The Capt'n owed me some money and he wouldn't give it to me. But he forked it out quick enough just now, when I said there was some friends of mine outside kind of curious to sample that Red Mill flour. I reckon you never did buy any Red Mill, nor won't either, less you join the fleet. Maybe then you'll find a prize in your package."

Some of the crowd laughed. The impression that the whole thing was a kind of April fool's joke seemed to be spreading, but there were several who looked thoughtful, and one of them called after Toots, who was walking off: "Here you! You've either said too much or too little. We-all want some explanation of this."

"You'll find it if you-all look hard enough," said Toots, declining to stop.

Daddy Simons was out on a job when Toots reached the cottage on the lagoon shore, but Nancy was at home, and very sorry to learn of his leaving Tigert's. But when Toots explained that, setting aside his personal relations with the proprietor, he refused to associate with any boot-legger, she agreed vigorously. She had all a decent girl's dislike for such a character.

"I wish you wouldn't go with that Crumb till it's been proved on Tigert," she exclaimed. "You could help. You're quite sure he does sell it, aren't you?"

"I know he does," said Toots. "He's been ready to jump out of his skin, or cut me out of mine since I first spoke about Red Mill. That flour isn't listed. I looked it up to see. Where he gets it from's his secret—one of his secrets. Another's those queer entries. If you want to know what I think, it's this: those figure 5s stand for five

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Stocum Company

dollars—five dollars extra per bag. That's why I told the crowd they might find a prize in every package. If you think a quart of hooch is a prize."

Nancy promised to take good care of what belongings, including his books, he meant to leave behind. Toots decided to take with him The Voyage of the Beagle and a manual on shells for collectors, the latter of which was among the volumes he had selected from the Broad View library. The choice did not please Nancy at all, and being a young person who spoke her mind freely, she told him so.

"Oh, Toots," she sighed. "I wish you'd take some really worth while books. Those two will only encourage the rolling stone in you."

Toots gave one of his rare laughs. "They encourage the thinking part of me anyways," he retorted. "Now don't you worry none about that rolling stone. I'm going to look into the oyster business and maybe invest in it. Here's the two hundred, and fifty more I've saved out of what Tigert paid me. I want you to keep it till I know how I'm going to use it."

With a good deal of trepidation and after some argument Nancy consented to take the money, which she said she would give her father the instant he came home. Also she insisted on making out a receipt, which she solemnly signed and handed to Toots.

"You really save your money awfully well if you do roll," she said admiringly. "I wish you could find some good thing here you could stick to—forever and ever."

"Maybe if the oyster business don't pan out right I'll come back and start a gunners' boarding house with you and Daddy," replied Toots jestingly. They had stepped into the ell kitchen where Nancy was

The Cheerful Plowman

A WOMAN'S WORK

I USED to think a woman's work was easy stuff to do. I used to chuckle and to smirk, to snicker through and through, when women talked about the jobs that they performed on earth, like cooking corn upon the cobs, and frying beans of worth.

I smiled when they would talk of brooms, of dust-pans and of spoons, as if those things were large as looms, extremely weighty tools. And when they talked of ironing shirts as heavy, heavy work, or putting plates in flimsy skirts as tasks they'd like to shirk, I simply had to laugh outright. 'Twas all that I could do, I had to laugh with all my might and shout, "Too-hoo! Too-hoo!"

"If women had to deal with plows and buckskin mules," I said, "or had to tussle with the cows, or bronchos seeing red; if they were forced to lift on rocks, or pry on stubborn stones, or shovel from a wagon-box a load of mud and bones, they then would learn that work is hard, that so-called work is play, that sewing buttons on a card is not like pitching hay!"

So much for that, but listen now to all I've learned of late, and then you'll see just why and how I've changed my mind and gait. The other day I thought I'd iron my shirt, and pants, and tie, and by the Saints Jerome and Byron, I nearly had to die. I stood beside the ironing board until my legs were numb, until each muscle, vein and cord was strictly on the bum.

At first it seemed a dainty job, a job a child could do, but I was strictly on the bob before one shirt was through, and when I started on the pants, I lost my mind, I guess, and stood there in a semi-trance, like some one playing chess. I stood there tired and nearly dead, all bushed and fagged and sore, while that old flat-iron, heated red, burned through and struck the floor!

J. E. T.

craft. Crumb purposely left most of the work getting under way to Toots. He seemed pleased with the way the boy handled the boat. For part Toots was favorably impressed by his employer, who was a silent, serious-minded, well-known as a total abstainer, and rather religious, a trait that was enough in itself to set apart from the majority of his fellows. Toots heard him spoken of as the Goose King. He was a crack shot and the most successful wildfowl hunter of the fleet. He could imitate perfectly note of any game bird.

The sharpie drew away from the town, slipping through the water swiftly and silently. Toots forward and flattened the jib. Then he returned and stretched himself on the deck alongside the little cockpit. The wind struck him as cold and asked Crumb if much ice ever formed in the waterways.

CRUMB looked at him with an eye as circled a duck's. It gave Toots a little shock. He never heard that the Captain was a "simple" there was that in his glance that made Toots feel he couldn't be quite all there. There seemed no end to the odd characters one ran into on Mink Island.

"You get your bellyful of ice here sometimes," said Crumb. "I've seen it freeze clear down to top of the flats. I don't see why the good Lord created it. No, I don't. It seems like a cruel trick for Him to have done."

Crumb's voice showed so much feeling for Toots let the subject drop. They were running rectly north, the sharpie reeling off the knob in clever fashion. The waterways were steadily rising up and growing wider while the number of marshy islets lessened. The ebb tide flowed. It was easy to distinguish the darker curving of the channels from the light areas above. A few curlew and "brown backs" were winging, all heading toward a high bar where mallards sounded at intervals from the creeks.

The sharpie pushed her thin nose into a bay-like body of water, roughly oval, and seven or eight miles in length. They must be this, Crumb remarked, to reach Mink Island, which his shack or watch-house stood. The crew were local people. They had a home on the land south of Carrbury, and this house on marsh. The brothers did not live aboard their boats as did so many of the oystermen, who came to distant points up and down the coast—"all the lot," as Crumb said—and stayed on the ground for six to eight months at a time.

Mink Island loomed up plainly when they reached the middle of the bay. It was a bit of marsh of not more than fifty acres in extent, showing at the moment abrupt muddiness and a level top covered with coarse sedge. The highest tides it was completely under water and for this reason the watch-house, only structure on the little islet, stood on wooden legs like a forlorn and lonely one. Toots presently observed a man descend the bank and walk down to an indentation in the shore where a number of punts and other small boats were lying.

"That's Bartlett," remarked Crumb. "I never he's plumb out of terbaccer an' just can't get a smoke."

The surmise was correct, for when they shot into the little cove the man made a word of his hands and shouted something in which word tobacco was distinguishable. Crumb replied by a reassuring gesture. With her sails the sharpie lost headway and came to rest as the anchor splashed overboard. Bartlett, who pushed out in a rowboat, came alongside and delivered the various bags and packages. He opened one and taking out a plug of tobacco began to slice it into his palm.

"Thought I'd tell ye Sheppardson was here," he said. He stared fixedly at Toots. Then he turned to Crumb, making a slight jerking motion with his elbow and dropping one eyelid at the same time.

Crumb, with his immovable face, said: "Is Toots Pouche, Bart. He'll be one of us Sheppardson's here?"

(To be continued.)

When We Were in Harrisburg

By GERTRUDE S. STEWART

It was such a good time we women folks had in Harrisburg. We wish every reader of these pages could have been there. To have the products on display—the many shining luscious fruits and vitamin-filled vegetables, stacks of pretty dresses so well made, the many night gowns and slips, the golden corn and honey, the eggs and poultry, baby beavers other prize-winning stock, maple products and products—yes, the exhibits alone made the worth while.

There was much more to it. We saw many things to inspire and arouse us. We heard a great deal that will keep us thinking along new and better ways for a long time. We farm women with so many similar problems were brushing elbows during these times when anticipating the next address: we were leaving old friendships and making new ties. We were laughing, thinking, listening, relaxing, dreaming, and so on.

Some of us will be better wives and mothers—more genuine homemakers, because we went to Harrisburg.

About Daughter's Room

One of the exhibits where we stopped a second time was the project for girls taking advantage of Extension work. The farm daughter's room was "dressed up" and less than ten dollars did the trick in clever figures.

The single bed was transformed into an attractive day bed by ingenious use of burr feed bags. A home-made robe made us forget the endless room. It was a closet in proud of—neatly made quite decorative with its shoe bag and modern laundromat bag that unbuttons for the day emptying.

Time-made lamp shades about the eye of every visitor, one of them had its fixture fastened in a quaint jug. The vanity dresser was made by using wire crates, well placed and neatly covered and painted.

If you have a daughter, you might like to try putting up her room. Let the State Extension office help you. They have the plans and measurements and can save you time, trouble and expense.

Three Thousand Turkeys!

One of Pennsylvania's ambitious women, Mrs. George Lohr Johnson, was crowned Queen of the Turkey Kingdom. And no wonder for she had a flock of more than three thousand fine birds. She is a school teacher, too, so we must indeed praise her for splendid work and unusual ambition.

Many enthusiasts attended the meeting where the turkey boys went under discussion, and no doubt the year's decision as to who merits the turkey title.

Whether your central interest is poultry, potatoes, vegetables, bees, sheep, cattle, horticulture, or Poland-Chinas, there were special sessions with addresses and discussions fitting the need.

The Society of Farm Women

This group is planning to double its membership this year, and among their studies for the year will be the turkey, the bees, and the industries of their own communities, and to the institutions of their own times.

Their resolutions include beautifying the farm home, awakening the women to a higher sense

The Farm Home

The Big Job of the Farm

By HEPSY NEFF

AFEW days ago the following letter reached me: "I would like to know the best way to render lard. How long should it be cooked and why does it become strong sometimes even when not very old. I usually put my lard in empty tin coffee cans. It seems nice and white but after a few months it has a strong odor. We expect to butcher soon and I would like to have this answered as soon as possible."

Because of the request for an early reply I took up Farmers' Bulletin 183: "Meats on the Farm; Butchering, Curing and Keeping," quoted the following directions for trying out lard and mailed it at once to the writer. The extract follows.

"Only the best of fat should be used for choice lard. Leaf fat is best. The back strip of the side also makes nice lard and also the ham and shoulder and neck trimmings. Gut fat should never be mixed with leaf fat and back fat. It makes a strong smelling fat and should be kept separate."

All scraps of lean meat should be cut out of the fat before trying out as they are likely to stick to the kettle and get scorched, giving an unpleasant flavor to the lard. When preparing the fat cut it in pieces from one to one and one-half inches square. They should be nearly equal in size that they may finish at the same time. Fill a clean kettle about three-fourths full of the fat and put in a quart of water or, if convenient, a quart of hot lard. One or the other is necessary to prevent the fat from burning before the heat is sufficient to bring out the grease. Keep the kettle over a moderate fire until the cracklings are beginning to brown and are light enough to float. Frequent stirring is necessary to prevent burning.

When done remove from the stove and allow to cool slightly, then strain through a muslin cloth into a large jar. Stir occasionally until it begins to harden. If pails or smaller jars are to be filled the lard should be dipped out while it is still liquid. Stirring while it is cooling tends to whiten it and make it smoother. A quart of a pound of saleratus added to each 100 pounds of fat has a like good effect."

This extract will serve as a basis for helpful suggestions from our readers as well as to bring Bulletin 183 to the attention of our young farm folks who have not yet seen it. It is a free booklet of six-by-nine inches, 37 pages and 35 pictures showing both the best tools and the best ways of using them in this big job of turning the cattle, sheep, hogs and poultry of the farm into food for the farm table.

For all vigorous, outdoor workers meat stands at the head of appetizing and nourishing foods. At its best nothing is more valuable; at its worst no food is more harmful. We may not be able to put the effect of our higher standards of living into figures which would show the large per cent of mental, moral and physical giants who have helped America into world leadership. It is quality, good work that counts and demands the best from start to finish.

The troublesome child may be merely the tired child. When introducing new foods in the child's diet give only one food at a time and that in a small quantity, well-cooked and nicely served.

Boiled milk has a tendency to stick to the pan in which it is heated. After removing it from the stove, pour out the milk and replace the cover immediately before the steam has a chance to escape. Let it cool. Then place the pan in cold water to soak.

WIVES OF THE MASTER FARMERS OF 1929
Standing, left to right—Mrs. Charles F. Preston, Mrs. Henry F. Garber, Mrs. Harvey C. Kreitz, Mrs. Norman E. Rishel, Mrs. R. P. McDowell, mother of McDowell brothers, Mrs. John McDowell.
Seated, left to right—Mrs. George M. Anthony, Mrs. C. R. Bauernmaster, Mrs. John D. Reynolds, Mrs. Guy L. Hayman, Mrs. Ray C. Norman and Mrs. Guy A. Leader.

The tiny ones have big interests in Master Farmer homes—one lad of but four specializing with his very own flock of "bantams." Music has its place in these homes and two of this year's group have family orchestras.

These women consider electricity their biggest and best helper. Several use electric ranges for all the farm cooking and baking. One of them even washes her dishes electrically! How we would all relish that!

Riding a "hobby" occupies a bit of their time, too. There are several prize flower gardens in the group, two are energetic club leaders, three lean toward music—all help their husbands with the feathered friends and dairies, and one decorates china.

It was good to hear the husbands give so much credit to the wife for the great success and honor each had attained. Recreation has its place in each home. These families go on motor trips, fishing excursions, hunting expeditions, and there are some "ole swimmin' holes" right on their farms. They play with their children. Perhaps that's what has made them Master Farmers.

To protect the top of blankets and quilts from being soiled, bind the edge with a piece of cheesecloth or other inexpensive material about sixteen inches wide which matches the blanket in color. When this is soiled it is easily removed and laundered.

The percolator which has become stained inside with coffee may be cleaned by filling the pot nearly full of boiling water and adding a teaspoon of soda. Let it boil a few minutes and then wash it out with soap and water.

\$4000.00

Let Your Heart Be Young

At no time of the year can we have so pretty a party as on February 14. Red hearts awaken even the dullest, and merriment prevails, so let's entertain. Invitations may be written on gay red hearts using white ink, or white note cards may be decorated with little red heart stickers, and red ink adds an interesting touch. Whether young or old or both are to be invited, use plenty of red crepe paper streamers, and many, many red hearts—all sizes—in decorating. Give the house a festive air. In fact the family alone likes that much, even if there is no party.

When We Eat

In the refreshments, too, let hearts abound. Heart shaped sandwiches, heart cookies, heart croquettes, heart-shaped paper dishes for vegetables or candies, heart salad mold—all these are decorative and jolly as well as delicious. The sandwich and cookie cutters can be made at home using baking-powder cans. They are not hard to bend into shape, and cut nicely. The same kind of cans with bottoms removed, can be bent into shape the entire length and will fashion a gellatine or jello mold for salad or dessert.

What Shall We Play?

"Partners" are especially interesting on Valentines Day, so pair them off giving half the guests hearts, and half arrows and matching up by number, name, or try love songs. In this game, half a song title is written on a heart and the remainder on an arrow. For instance, "Drink to me" would be on the heart, "only with thine eyes" on the arrow. When the two have discovered each other and all guests are mated, they sing or dramatize the song named on their cards. This gives the party a lively start.

"Is Love Blind" is another good game. Men or boys are separated from the girls and one at a time is blindfolded. A girl steps up to him and in her sweetest natural voice says: "Hello, friend James" (or whatever his name may be), and at once he replies "Greetings, Esther" (or her correct name). If he misses, Cupid gets his name and he has a forfeit to pay after all the men have tried their luck. Be sure to use your wit—guess the forfeits and a clever costume adds to the fun. Here crepe paper is not only suggestive but very striking. If you want a booklet of ideas, write us for that help.

"Cupid Shoots" is another good game. Here each is given a small bow and arrow. On the wall or in a doorway is put up a large white cardboard heart with a small red heart in the center. Each one shoots to hit the center, of course. It is wise to number or name each guest's shot or competition may be pretty sharp. A box of candy hearts is a nice prize.

For the children's party, all the above games are good and a "hunt" is much relished. Heart-shaped boxes for each hunter make nice souvenirs. Candies or tiny cookies, or the long-loved peanuts may be hunted. Older folks may seek their love-lorn fortunes. These are small notes tied up and hidden with love poems or song verses typed or written thereon.

Strawberry Mousse

If this cold weather continues, you'll enjoy making a nice mousse for your party or just for the family supper on Valentines Day. If you do not have an electric refrigerator, try the snow bank in your back yard. Now is the time to have these frozen dainties, so good for everybody.

Dral none quart of canned strawberries, and rub through a coarse sieve or potato ricer. Use enough of the canned syrup with crushed berries to have two cups. By using evaporated milk, a finer textured mousse

is made. To whip this milk, place the unopened can of evaporated milk in a pan of cold water to just cover it. Heat to boiling point, then chill thoroughly. Chill also your whipping bowl, and when ready to use whip about half at a time. The colder, the better, and your quantity will triple itself in the whipping. Then add one tablespoon lemon juice and whip again. Fold the berry mixture into the cream and pour into mold. Freeze and ripen for about four or five hours. If your berries have lost color, a few drops of red color will make the mousse prettier. Frolicsome Fun.

I Wish I Could Can, Too

A READER writes that she read with much interest our recent story about the prize-winning canners and she wishes she could can, too. She wonders if we can supply her with recipes for canning vegetables and fruits.

Yes we can and I have already sent her a packet. I wonder if there is any subject with more printed help for beginners. Not only do the pressure canner manufacturers print recipe books and time tables, but so do the firms who make glass jars and tin cans, jar rings and other canning supplies. Some of these books are free, others cost but a few cents to cover mailing expense. If you wish the addresses of these various firms, we'll be glad to supply them.

Every woman interested in canning should have the U. S. Bulletin No. 1471. This is free. Address your cards to U. S. Department of Agriculture, Washington, D. C. Pennsylvania women have another opportunity to study canning, and under expert guidance.

The State College has a free correspondence course and one of the subjects for women is No. 81—Canning and Preserving. Now women, here is your chance. Other subjects that may be studied are Garment Making, House Furnishing, Principles of Cookery and Table Service, while Home Floriculture, Vegetable Gardening and Poultry Keeping are also of gripping interest.

For more definite discussion of these courses write to Mr. Thomas I. Mairs, Pennsylvania State College, State College, Pa.

Gunning for Big Game

GUNS and all toggery ready, for we must start at an unseemly hour. With eighty miles or more to travel, we are off by ten o'clock of the night before the first day the law allows us to hunt down the beautiful wild deer. With moderate driving we arrive at our destination about 12:30 o'clock. We lie down to get some rest and sleep until dawn before which no deer must be shot.

When the call is given to arise, all is excitement and we hastily eat some breakfast, look at our guns and ammunition and off to the hills and woods we go.

Soon the crack of rifle is heard, sometimes one, sometimes two, three, or a dozen shots ring out and we know a deer has been brought down. Sometimes they can be seen, from camp, running for their life. The writer once saw a pair, from the porch. They were standing on the pinnacle of a high hill; hunters who were ready to lurch jumped and ran with their guns, disregarding the pangs of hunger; but the deer were soon out of reach.

Altogether it is a most exciting sport, for the farmer as well as the city sportsman. One cannot help but pity the victim when you think how wild and free it was a few short hours before.

The excitement overcomes the pity and we start home, even though we are not numbered among the lucky, vowing to return another year for the hunt because it is well worth it.

A. G. Unner.

No. 6692.—Ladies' Morning Frock. Cut in sizes 38, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. A 46-inch size requires 3½ yards of 35-inch material. Make belt and pockets of contrasting material requires ¼ yard 35-inch wide. Width of the dress at the lower edge of the plait fullness extended is 2 1-3 yards.

No. 6695.—Child's Rompers. Cut in sizes: 1, 2 and 3 years. A 2-year size requires 1½ yards of 35-inch material. Made without the bishop sleeve pattern. 1½ yards is required. For collar and cuffs of contrasting material ¼ yard is required cut crosswise.

No. 6696.—Ladies' Slip. Cut in sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. Medium size requires 2¼ yards of 35-inch material. For shoulder straps of ribbon 1 yard is required. The width at the edge with plait extended is 2½ yards.

No. 6694.—Girls' Dress. Cut in sizes: 2, 4 and 6 years. A 4-year size requires 1½ yards of material 35 inches wide. Collar and sleeve bands of contrasting material ¼ yard 32 inches wide is required cut crosswise. For plaiting on the collar 1½ yards 2 inches wide is required cut crosswise, or 1¼ yards of lace or elastic.

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Embroidery patterns 15c extra. Address Pattern Department, Pennsylvania Farmer, 701 Penn. Ave., Pittsburgh, Pa.

Canned Sausage

FOR many years I have canned sausage and my family likes it even better than the fresh product. Never has any spoiled done in this way.

I do not have a pressure cooker but there are others who may like my method while waiting for modern appliances. This recipe is for sausage in casings. To one gallon of water add one scant cup sugar and one-half cup salt, and bring to boiling point.

In another kettle place the sausage, you wish to can and add enough of this boiling liquid to cover. Boil twenty minutes. Then remove to platter and cut into lengths convenient for your jars. Keep the liquid boiling hot, and after the sausage is packed into jars, fill to overflowing with the liquid. Seal at once with perfect rings and covers.

When they are cold you will find the jars are about half full of liquid, the top half being fat that boiled out of the sausage. The gallon of water and salt will be enough for fifteen to eighteen quarts of sausage.

Mrs. John F. Heckert.

The Question Box

IF our friend who signed herself "Reader" will write to the Clothing Specialists, Extension Service, State College, Pa., she will get the desired help on making felt hats—large or small. Or better yet, if your county has a Home Demonstration Worker get in touch with her.

G. S. S.

The Tale of Nitrate of Soda

(Continued from page 5.)

father's farm in Ontario. Oxen did the plowing, dragging and hogging, writes Mr. Marsh. Horses did the lighter hauling on the farm and on the road. Plows, made by the local blacksmith, consisted of a wooden moldboard with an iron or steel share. They turned the furrow slice on edge but not over. Sowing was done by hand, broadcast. Corn was dropped by hand in shallow furrows made by the plow and then covered with a hoe. There were no carriages. Wagons, sleighs and other equipment were made by a country wagon maker and blacksmith. The entire outfit of implements needed on the farm, excepting the fanning mill, did not cost \$25 in cash.

Visit of Darwin.—On his memorable cruise on the Beagle, Darwin stopped in 1835 at Iquique to visit the nitrate fields. He was much impressed with the barren plateau, free from all vegetation.

Sheriff Makes Test.—John Ryds, sheriff to Frederic Mangles, Guilford Downs, England, in 1839 reported an increase in yield of 69.2 per cent by top-dressing his employer's wheat with nitrate of soda at the rate of 50 pounds per acre. This experiment attracted wide interest in both England and America.

In South Carolina.—In 1839, the Monticello Planters' Society of South Carolina planned a series of experiments in which nitrate of soda was dissolved in liquid manure and drilled with cotton and corn.

Tonic for Clover.—"Clover as high as grain" was grown by an English farmer during 1841, who planted barley and clover on a turnip field which was fertilized with 100 pounds of nitrate of soda.

Doubled Wheat Yield.—Before the days of the Department of Agriculture, farm records were kept in the office of the Commissioner of Patents. In his report of 1843 is given an account of another demonstration with nitrate of soda:

"On the 6th day of last May, five alternate ridges of wheat, measuring one acre, two roods and four perches, were sown with five cwt. of nitrate of soda in a field. In a few days the difference between the ridges sown with nitrate and the intervening ridges of the same, could be discerned at a considerable distance from the field; which continued through the summer. The two sorts have been reaped, threshed, measured and each weighed separately and the following is a correct account of the produce: Nitrate, 49 bushels; weight per bushel, 56 lbs.; straw, 2 tons 4 cwt. 3 qrs. and 5 lbs. The other 23 bushels; weight per bushel, 55 lbs.; straw, 1 ton, 5 cwt. 1 qr. and 2 lbs."

New View of Fertilizers.—Results of tests with fertilizers were summarized by the Albany Cultivator in 1844. A singular idea has just been suggested in Scotland," it reported, "in relation to the nutrition of plants. It may be summed up in a few words, that a sufficient quantity of elements of nutrition may be absorbed in the seed of wheat, oats, barley, etc., to ensure a very large product at harvest, without any other manure. Experiments have been made with complete success, and they have been published by the Agricultural Society of Scotland." Nitrate of soda was used in these experiments.

Years later this view was to be upheld by long-time experiments at the Rothamsted Station in England, at the Pennsylvania plots, and at many other stations in this country.

Early Experiment.—One of America's oldest fertilizer experiments was started in 1881 at the Pennsylvania State College. One of the significant results of these long tests is that it has been possible to maintain high crop yields with the use of mineral fertilizers. However, this has been possible only by using a complete fertilizer containing nitrogen (in the form of nitrate of soda) phosphoric acid and potash.

This Book gives the plain facts about

Alfalfa Clover Grasses

Oats

Hardy, dependable varieties, nine of which that yield better and pay better crop returns.

Corn

A dozen varieties. Early and late, yellow, white, for husking and for the silo. Sound and sure.

Barley

Six distinct varieties—two new smooth-beard types. Extra heavy yielders. Fancy seed.

Potatoes

Soy Beans

---and 20 other crops

Hoffman's FARM SEEDS

A plain, simply-written book about Quality Farm Seeds. The Hoffman people have been farmers for generations, and in the Farm Seed business for thirty years. In this book are given complete facts and reliable information, and you are to be the judge. The importance of truly good seed is pointed out strongly because its value has been learned time and again by hard experience. Farmers are not easily fooled—but sometimes they are over-concerned about the price. An extra dollar invested in good seed will always bring back many dollars to your pocket.

Hoffman's Farm Seeds are quality seeds, backed by a broad guarantee. Just as pure as the crop grows them and as up-to-date machinery can clean them. Free from foul weeds. See partial list of Hoffman's seeds on the left—this New Book offers many more—some that can't help but appeal to you.

Many new varieties are shown in this new book. When listed here, they are dependable. A change of seed is often good—brings new vitality—better crop results.

U. S. Government Verified-Origin
Alfalfa and Native Red Clover

Here at Hoffman's you will know truly where your Alfalfa and Red Clover seed was grown. Federal Government follows through from the man who grows the seed to the farmer who sows it. Every pound carefully checked and sealed. Uncle Sam's tag on every bag.

Chicken Lice and Mites

By W. E. WIECKING

CHICKEN lice are present on almost all poultry and mites make their appearance from time to time to worry the fowls and reduce egg production. These two pests are so prevalent that we have come to look on them as necessary evils. It has been found, however, that they can be eradicated from any farm flock by the application of vigorous control measures.

The time to start the control of these pests is in the spring before the incubation and brooding of young chickens start. At this time there are the least number of fowls to treat, and if the work is done thoroughly there will be no attention necessary to be given to the young chicks when they are hatched.

Chicken lice are parasites in one sense of the word and they very seldom leave their host. They occur on various parts of the body, but each of the common forms of lice found on chickens prefers a particular part of the body for its habitation.

One of the kinds that cause serious damage to poultry is the head louse. This louse is grayish in color and about a tenth of an inch long. It is usually found on the top or back of the head, beneath the bill or back of the ears. It is the principal louse that affects chicks and is the only one against which one must guard his young chickens. Their numbers decrease with the age of the chicken because they thrive best in the soft down on the young chicken.

The Common Mite

The body louse likes to remain on the skin of the chicken instead of on the feathers as some species do. It is usually found in the region of the vent but will spread readily to other parts of the body when the chicken becomes heavily infested. The parts to be treated for this louse are below the vent, along the back, on the legs and under the wings. There are many other forms of lice besides these two common species but they are less prevalent and treatment for the first two will usually control the others as well.

The common chicken mite is an entirely different insect from the chicken louse. The mite is a blood sucker and does almost all of its work at night and is seldom found on the chicken in the day time. It is for this reason that the premises may be heavily infested with this pest without them coming to the notice of the poultryman. They are usually noticed by small patches of black and white specks like salt and pepper spilled on the boards around the roosts or the mites themselves can be seen hiding in the cracks of the boards.

Lice are more easily controlled than the mites although it was until recently easier to eradicate the mites than it was the lice. Dust baths have been used for years to help in the control of these pests but they are worthless against mites and are very little help against lice because many fowls will seldom use the dust bath and so they will reinfest others in the flock.

Pinch Dusting Methods

In recent years a new treatment for lice has been developed by the U. S. Department of Agriculture that if it is applied generally over the country will do more than any other remedy to eradicate the lice among fowls. This treatment consists of dusting the fowls with powdered sodium fluoride in such a way that the lice on all parts of the chicken's body is reached. In this way all of the lice on each is killed at one time and if all chickens are treated at the same time all of

the lice on the premises are killed in one treatment.

Sodium fluoride is a compound of sodium and fluorine which looks a good deal like common salt with which it is very closely related. The commercial product is fairly cheap, costing from thirty to sixty cents a pound which should be sufficient to treat a hundred fowls by the method given below. This form of this substance is a fine powder and is easily dusted on the fowls. It may be better known to some of us in another form for it has been the principal ingredient in cock-roach powders for a number of years.

Sodium fluoride is best applied to the fowls by the pinch dusting method. A small pinch of the substance is rubbed into the feathers about the head and neck, two on the back, one on the breast, one below the vent, one on the tail, one pinch on either thigh and one on the under side of each wing. If small chicks are to be treated they must be over a week old and two small pinches are all that should be used, one on the head, neck and throat, the other on the back and vent. The old hen should receive only three pinches at this time on the head, back and below the vent.

Destroy Old Roosts

Although they are more difficult to find about the premises mites are perhaps more easily controlled than lice. As they are seldom found on the fowls in the day time it is necessary to search for their hiding places and destroy them there with contact spray materials. The first essential in combating mites is to get rid of as many of their hiding places as possible. For this reason it will be necessary to remove and destroy all old roosts, boards and boxes that may be found in the hen-houses.

The litter and straw on the floors must all be removed and burned and then when the house is as clean as such methods are possible to make it will be necessary to paint or spray all the inside of the house with some good contact spray material. For this purpose it has been found that lime-sulphur spray is not very effective against chicken mites.

Crude oil thinned down with about one-fourth of its volume of kerosene is one of the cheapest and best sprays to use for killing mites. Crude oil may stain the clothing and hens and if this is objectionable it will be necessary to make use of a more expensive material such as commercial carbolineum or creosote oil.

Both of these are derived from coal tar and are considerably dearer than the crude petroleum, however, each is very lasting and one good application will usually rid the premises of these pests.

The control measures for these two common pests are also easy to apply. Most reinfestations are caused by the introduction of new fowls to the flock or they may be introduced by strays from neighboring flocks coming in contact with a clean bunch. If new fowls are to be introduced to the flock it is the better part of wisdom to keep them isolated from the main body of fowls until it is certain that they do not carry either lice or mites around with them.

Other ways in which the premises may become infested is through the use of second-hand chicken crates, or they may be brought along on clothing, wagons or may be left among the flock by birds, most commonly by the English sparrows. The only way to keep the flock from infestation from these sources is to guard against the members of the flock coming in contact with this class of objects as much as possible.

The Ad Said "ENOUGH VITAMIN D TO RAISE PERFECT CHICKS IN A DARK ROOM" SO-

FACTS

about the private test made by L. H. Kelly, Pratt dealer, Janesville, Wis. 300 day-old chicks confined in a light-proof basement. Fed Pratt's Baby Chick Food, processed with Vitamin D. At 4 weeks, chicks averaged 12½ oz. No runts. No leg weakness. At 6 weeks, chicks averaged 15½ oz. (normal weight for 8 weeks is 12 oz.). "Most uniform I ever saw. Large bone, strong bodies, no sign of leg weakness", Mr. Kelly says.

THIS DEALER TRIED IT HIMSELF—

Last season Pratt's announced a special processing of Buttermilk Baby Chick Food that so enriched this food with Sun-Vitamin D that it raised perfect chicks in a dark room.

But one Wisconsin dealer was "from Missouri." So he tried the experiment himself in his own basement. The results so astonished him that he became a crusader for Pratt's. All his customers

were urged to nourish new chicks with this food that supplied in abundance the ONE element that prevents leg-weakness, low vitality and slow growth. As a consequence, losses of this kind were cut to a fraction for his customers.

And Raised Chicks 25% Overweight!

Of course, the dark room test is an extreme one. But not so far at that from those dark damp days of February and March when chicks nowadays are hatched and started.

Don't expect chicks to get the nourishment from other food, however good, unless they have enough Vitamin D. Rich as Pratt's is in all the food elements that build

of the incubator or the care of the breeding stock.

Since the eggs are apparently fertile and the chicks develop through to the 18th day and then fail to hatch, it would seem that little adjustments in the management of your machine would overcome the trouble. The best suggestion which I can offer is for you to write to the concern from which you purchased your machine and secure their advice on the subject.

Some machines require a great amount of humidity for best results. A regular temperature is most important. Never should the thermometer record higher than that recommended by the incubator manufacturer. Most incubator companies have a corps of specialists to devote their time to research problems in incubation and certainly they should be able to assist you in locating your trouble.

H. C. K.

Turkey Has Roup

I have a turkey hen which is puffed a little under one eye. I caught her today and one nostril was closed with dirt, had formed a scab. I picked it off and put a little salve on it, also rubbed under her eye with same. If that is the beginning of roup, do you know of any remedy I could use to prevent it?

I see in the December 21 Pennsylvania Farmer about breeding turkeys. Why should old turkey hens be mated to young toms? I lose so many baby turkeys the first and second week. I would like to know the cause.

Winnie Husfelt.

A SWELLING under the eye is often an indication of roup. I don't know of anything better you could have given the bird than the remedy you applied. It would be a good idea to repeat the treatment from time to time, until she gets better. Sometimes these swellings come to a head and can be lanced and squeezed out, but I wouldn't be in any hurry to cut unless the swelling plainly is ready for it.

It is a general rule in breeding poultry to mate young males with old females and vice versa, but like most rules it can be and is broken. Your young turkeys may suffer from lice or be soaked from the wet grass. Have you ever tried raising them in brooders just like baby chicks? Many people are very successful with them that way.

R. L. S.

The Tobacco Treatment

Is there merit in the powdered tobacco treatment for worms in laying hens? If so, let me know the exact amount to be added to 740 pounds of laying mash, also I would like to use same as a mild continuous treatment rather than severe or spasmodic.

Russell L. Shelby.

TOBACCO powder is commonly used in the laying mash as a remedy for roundworms, at the rate of one and one-half or two per cent. For 740 pounds of mash you should mix in thoroughly from 10 to 15 pounds.

If you find your flock is wormy, I would suggest feeding this tobacco mash for a week or so, and then discontinuing it, feeding it again at some future period if you think there is need for it. I have often used this treatment, but would prefer not to give the tobacco in the mash continuously.

R. L. S.

A Hard-Boiled Egg

Oftentimes when I boil an egg ten minutes the white turns dark and the yolk sort of green on the outside. Will you kindly explain what causes this?

William Gieb.

IT has been our observation that when eggs have been boiled for ten minutes or more it is not uncommon for the whites to turn dark and the yolks a greenish color on the outside. Eggs boiled in this manner probably lose most of the vitamin potency. The suggestion has been made that perhaps eggs with olive-colored yolks when boiled for a long period of time present an appearance similar to that described by you. The use of cottonseed meal in the ration and perhaps other ingredients of a similar nature might be responsible for this condition.

H. C. K.

KERR'S CHICKS

Keep next fall's laying in mind when you buy baby chicks

KERR CHICKS have strength and livability, but they have more, much more. They have an assured laying inheritance.

Keep this in mind. It is a point for first consideration. The eggs you get from pullets next fall will depend on the judgment you use in buying baby chicks now.

Our White Leghorns are rich with the blood of hens with records up to 294 eggs. Our Barred Rocks carry the blood of layers with records up to 277 eggs. Our R. I. Reds with records up to 300 eggs.

Over 40,000 birds in our laying flocks tested for B. W. Diarrhea. Flocks rigidly culled for size, type, vigor and production.

Write for the 1930 Chick Book giving prices.

Poultry Problems

Stunted Chickens

I am writing to ask what ails my chickens. They did not grow right during the summer and are small in size. Leghorns some of them weigh only one and one-half pounds at six weeks. They seem healthy and combs are red, but on examination I find the keel bones in places are narrow and small in size and of a thick, meaty appearance.

W. C. G.

OUR chickens have been stunted by some intestinal trouble, probably coccidiosis, which irritated the intestines to such an extent that they failed to assimilate food properly, checking growth. Unfortunately nothing can be done now to help these, and my advice is to dispose of them but the best.

Next season the thing to do is to keep your chickens on clean ground. Birds of any age have not been several years, and it would be better to rear in partial or total confinement. I suggest that you write the Poultry Department, Pennsylvania State College, State College, for their free circular on raising chickens in confinement.

R. L. S.

Winter Molt

Last spring I took eggs to our local hatchery and had them hatched. Got chicks May 6th. They are Leghorns. I lost only 14 out of the 324. Most of them died before they were two weeks old. They grew and laid better than any I ever raised. In the middle of November they were going around 40 per cent. The 30th November we had a severe cold spell and it cut production to about 30 per cent, although no combs were frozen. Then some are getting pale combs and wattles which are shrinking up. I killed and examined them, thought they might have worms, but I couldn't find any.

I. M. Behm.

It appears to me that your pullets are going into a winter molt, which is usually caused by the shock of cold spell. I don't know of anything in particular which you can do to bring them out of it, except to give them ordinary good care and let nature take its course. If you have the birds under lights, they will get into production all the quicker. Any other developments come up, let me a line.

R. L. S.

Carrots for Feed

Writing for information on how to feed carrots to chickens. I have about 25 bushels and cannot get rid of them. Do you think raw carrots will do any good?

G. J. S.

CARROTS are exceptionally good for chickens, although in some cases they have their own notions of eating them. They can be fed the rate of three to five pounds per 100 birds per day, and the birds will relish them more if they are fed before feeding.

R. L. S.

Roup Symptoms

A peculiar thing has got among my hens. Their eyes first get watery and look like soapuds, then they shut and look as if they were blind. The birds sneeze and have raw blisters in throat and won't eat.

E. M. K.

ACCORDING to the symptoms you outline your birds have roup. It is very little that can be done to control this disease, which must run its natural course, except to provide a dry and clean house, sheltered drafts and give good ordinary feed. Birds badly affected may as well be killed, as they seldom recover. Others may respond to treatment.

R. L. S.

Incubator Trouble

I have an incubator with which I have some trouble. The chicks are all dead by the 15th day and up to the 18th day. Then many die in the shell.

R. J. Arnold.

IF eggs don't hatch is a problem which requires careful attention. Of course, it is a simple matter to blame the incubator. Very often trouble lies with the management.

IN ONE BAG

A Chick Starter A Chick Grower

FOR a good start, chicks need a clean, fresh feed that combines all the various proteins, minerals, vitamins, and energy yielding feeds essential for quick growth. To carry them through to healthy, vigorous maturity, chicks need these SAME FEEDS in increasing amounts.

Amco Starting and Growing Mash gives you all these feeds in one bag. Feed it alone as an all-mash for the first eight weeks. Then, after the broilers are gone, keep right on feeding this mash with an increasing amount of

Amco Scratch Grains to provide for the growing energy requirements.

The Open Formula tags on all bags give feeding directions and show that this mash contains 100 lbs. per ton of Dried Buttermilk, the most sanitary and convenient form of this important chick builder.

It may be purchased with or without Cod Liver Oil mixed in.

For full information see your nearest Amco Agent or write to the address below.

How Mrs. Potts Saved 97% of all her chicks

Now Mrs. Potts (full name and address on request) raises 97% of her chicks in the light, dry, tank-construction, round, brooder house made by Young's Poultry Houses. She can easily keep uniform heat in all weather. Her house is not tight and disconcerting to young chicks. It is so perfect that something is missing in her house. She believes this is the best brooder house on the market. It is one of the strongest and also one of the cheapest. Would you be interested in the HARPER ROUND WOOD BROODER HOUSE which Mrs. Potts is finding so profitable? Write at once for small "early bird" discount, descriptive folder and prices. Save chicks and money!

Garden and Truck Crops

By GILBERT S. WATTS

"POOR seed is worse than dead seed."

That quotation is from a talk given before the Pennsylvania Vegetable Growers' Association by Mr. C. H. Nissley of New Jersey. And how much worse poor seed is than dead seed! Time is lost. Fertilizer is wasted. The vacant spaces are idle land. Weak plants start backwardly. But half of a crop is secured in the end. In other words opportunity to make a profit is wiped out at the beginning.

Mr. Nissley further emphasized the supreme importance of eliminating chance and guess work from our gardening operations if we are to continue to compete successfully. He called attention to our advantages in respect to roads, location and markets. Yet the fact remains that larger production per acre and better grading and packing will be required to keep up with the pace that has been set.

Sterilizing for Damping Off

In a discussion of plant growing Mr. Nissley urged that soil known to be infested with "damping off" be sterilized either by steam or formaldehyde. In either case great care must be exercised not to introduce the fungus into the newly sterilized beds by walking over the soil or by using tools that have not been treated.

In the formaldehyde method four pints of 40 per cent formaldehyde are mixed with 50 gallons of water. The solution is then sprinkled evenly over the soil to be treated, applying at the rate of one gallon per square foot. Cover with burlap or canvas for about 48 hours. Then air ten days and plant.

Fertilizing Vegetable Crops

In a discussion of this subject at Harrisburg, Mr. H. N. Dudley, a celery and spinach specialist, who is located near Philadelphia, opened by stating that he applies nearly all the fertilizer broadcast and harrows in before planting. For the leafy crops that he grows Mr. Dudley employs a mixture containing approximately equal percentages of nitrogen, phosphorus and potash.

Prof. J. G. Stout of State College reviewed the development of concentrated fertilizers. Apparently they will continue to prove satisfactory for vegetable growing. He urged that in figuring fertilizer costs and applications we make sure that equivalent amounts of plant food are being compared.

Prof. J. M. Huffington, extension specialist in vegetable gardening, presented the results of a study of experiment station findings on fertilization of vegetables. A boiled-down edition of this paper will be mailed to members of the Pennsylvania Vegetable Growers' Association by Walter B. Nissley, secretary, Horticultural Bldg., State College, Pa. Dues are one dollar a year. In passing let us note:

Frequent light applications of manure have been more profitable than infrequent heavy applications.

The efficiency of manure has been greater on limed soils.

Phosphorous (superphosphate) also is required to secure greater efficiency with manure.

In Rhode Island 16 tons of manure plus fertilizer gave larger and more economical yields than 32 tons of manure alone.

In several experiments yields have been maintained at satisfactory levels by intelligent and intensive use of green manures, commercial fertilizers and lime.

On asparagus, where the tops have been disked into the soil each year, fertilizer has given as good yields as manure. Apparently it is profitable

to apply some readily available nitrogen to asparagus early in the spring.

The MARKET PLACE

By W. R. WHITACRE

THE Farm Show is drawing to its close as I write this, and cars loaded with farmers and other visitors are leaving the city. It has been a great show and despite the snow and ice-covered streets, the exhibit buildings have been crowded to capacity with throngs of interested folks. Meetings have been well attended and there has seemed to be more enthusiasm than formerly.

It is impossible to see and hear all that one desires, as the program has been full of interesting things. One of the points that has been stressed in almost every meeting at which I attended has been advertising. The potato growers, the vegetable growers and farmers' market operators are vitally interested, and I believe a definite program will be worked out.

Quality Counts

In the vegetable growers' meeting C. M. Smith of Lewistown told of the advantages he had received by putting out first-class produce and letting people know that it was his. He has adopted a special package for his crops that tells the buyer where it was grown. He stated that attractive labels often brought him 10 cents to 25 cents extra on each package. Herman Gosser, a commission merchant of Philadelphia, told the growers that colored tags bearing the grower's name attached to sacks containing sweet corn made a definite increase in the demand for that grower's corn and he was able to sell it at premium prices.

Henry Eby, county agent from Allegheny county, showed labels used by the growers in his section which have enabled them to get better prices for their produce. He pointed out that it is the woman who buys the fruits and vegetables and the sales appeal must be directed to her. Growers may think it is all hokum and useless expense and work, but they have found that the consumer is willing to pay a little extra to get a first-class attractive package.

More Sweet Corn Sold

Gilbert Watts showed us small slips which he had printed and used last summer, which materially increased his sales of sweet corn. These slips advertised his corn and informed the consumer that freshly gathered corn had a far better flavor than that which has been pulled for several days.

The chain stores were discussed from numerous angles. Their effects on the farmer appear to be both favorable and unfavorable. They are out to make money, but the growers who have sold to them report satisfactory dealings. The chief difficulty is to reach the man who does the buying, since the individual store manager is not usually empowered to buy. This is the reason that Idaho and Maine potatoes are sold in the heart of the Pennsylvania potato growing sections.

A rather new trend of thought was noticed at both vegetable growers' and potato growers' meetings. It was that nearness to market is actually proving a disadvantage rather than an advantage to many Pennsylvania growers. The reasons given were that nearness to market results in poor grading and packing and general lack of uniformity.

Truslow Chicks

—the Product of Our 48 Years of Experience in BREEDING

This year our flocks were mated with the cockerels we could produce, together with birds procured direct from such famous breeders as Newton Cosh, Harry Wolfeffer and Bob Wood Farms, Truslow Barred Rocks, Leghorns, R. I. Reds, White Rocks and Wyandottes, so popular that you must order early to avoid disappointment. Write for our Free Book and state your requirements so we can give special prices.

We have just discovered a method which actively controls coccidiosis. This is the result of hundreds of experiments. No milk—no drug. Bulletin describing this wonderful discovery is being printed. Send 10c for your copy.

You can make your farming more profitable with a RADIOLA

WITH a Radiola in your home you get crop news, weather forecasts, market bulletins and price reports the day they are issued by the Government and other agencies. The most important items in tomorrow's newspapers reach you today when you have a Radiola to give you instantaneous connection with the great broadcasting stations.

This service is an invaluable one to the modern business farmer. Many owners of Radiolas say they could not afford to be without it. And, in addition, a Radiola is a source of home entertainment without an

equal. It brings you with amazing realism programs that cost millions of dollars a year to put on the air. There can never be a dull evening at home when you have a Radiola to draw music out of the skies.

RCA—the world's greatest radio manufacturing organization—has designed high-power Screen-Grid Radiolas of the latest type that are ideal to use in homes not having central station electric service.

The RCA dealer near you will gladly show you these fine models of the famous Radiola. No finer instruments are built at comparable prices.

Look for and insist upon the famous RCA trademark

RCA RADIOLA 22—Cabinet model. Screen-Grid receiver for battery operation. With enclosed RCA Loudspeaker. \$135 (less Radiotrons)

RCA RADIOLA 21—High-powered Screen-Grid receiver for battery operation. \$69.50 (less Radiotrons)

RCA LOUDSPEAKER 103—The leading magnetic-type radio reproducer. Designed to harmonize with home furnishings. \$18

RCA RADIOLA 45—Console type. All-electric (A.C.). A magnificent model wrought in a striking, beautiful modern design. \$54 (less Radiotrons)

RADIOLA DIVISION RADIO-VICTOR CORPORATION OF AMERICA

Many people envy the man in a "Used" BUICK
... and no one ever thinks of it as "used"!

The familiar saying, "Happiness is a state of mind," applies to *motoring happiness*, too. And real motoring happiness will be yours if you join with the tens of thousands of men and women who purchase used Buicks from authorized Buick dealers.

Good, sound, logical reasoning tells these buyers they will derive more pleasure from a reconditioned Buick than from a new car of similar price. And the more they drive their Buicks—and experience the thrill of Buick performance—the more convinced they become of Buick's greater value.

Not only does Buick hold greater prestige, comfort and luxury . . . not only does it combine infinitely more power, speed and

all-round performance . . . but it provides that staunch roadability which only a car of Buick size can give, as well as that unvarying dependability for which Buick is world-famous.

Moreover, a Buick is always a Buick—whether one, two, or five years old—because Buick craftsmen build scores of thousands of miles into every Buick.

Decide now to own the Buick you've long wanted. *And make satisfaction doubly sure by buying from a Buick dealer.*

He has an unusually wide assortment. He prices his Buicks fairly and stands squarely back of them. His establishment is *the* place in your community to buy a used car.

Buick-Motors: Dealers sell used cars on the extremely liberal General Motors time payment plan

BUICK MOTOR COMPANY, FLINT, MICHIGAN

Division of General Motors Corporation
Canadian Factories: Builders of Buick and Marquette Motor Cars
McLaughlin-Buick, Oshawa, Ont.

Another New CASE tractor

HERE is another new Case Tractor—the Model "C", a 2-3 plow size. This tractor, which is a smaller brother to the Model "L", offers something entirely new in power output and all-around usefulness.

New Power for Size and Weight. The tractor is low and compact. It is only 48 inches high . . . weighs but a trifle more than two draft horses . . . yet it pulls 2-3 plow bottoms . . . a 22x36 inch thresher with all attachments . . . or other machines of comparable capacities.

New Speed for Farm Work. Three forward speeds, $2\frac{1}{3}$, $3\frac{1}{3}$ and $4\frac{1}{3}$ miles an hour, provide the proper speed for highly efficient performance of every kind of field job. This enables you to do more work in a day.

New Range of Usefulness. The tractor is adapted to a wide range of drawbar, belt or power take-off operations. Because of its compactness and light weight, it can be used for more jobs—more days in the year. It turns in short space and is easy to handle.

Never before have you been able to get a tractor with this combination of power, weight, size, speed and ease of handling. These advantages mean new opportunities in profitable tractor farming. Send for more information. The coupon is for your convenience.

J. I. CASE CO., Inc., Racine, Wis.

1. Powerful, valve-in-head engine.
2. Removable cylinder sleeves.
3. Heavy 3-bearing crankshaft drilled for pressure lubrication.
4. All parts sealed against dust.
5. Hand operated clutch, easily handled from the ground or tractor seat.
6. Final drive of strong steel roller chains, enclosed and operating in oil.
7. Three forward speeds, $2\frac{1}{3}$, $3\frac{1}{3}$ and $4\frac{1}{3}$ miles per hour.
8. Irreversible steering gear. Outside turning radius—10 ft.

POWERFUL LIGHT and FAST for EVERY PURPOSE

Name

Address

We want your feet to be really healthy and comfortable

FIRST:

Get this free book, "The Care of Farmers' Feet," written by Dr. Lelyveld, noted podiatrist. Write to the United States Rubber Company, Dept. FFF-20, 1790 Broadway, New York.

SECOND:

Demand comfort and flexibility even in the heavy footwear you buy. And—make sure that it fits.

NOW, about that little book we'd like you to have. Dr. Lelyveld wrote it especially for the United States Rubber Company. He is a noted podiatrist (foot-specialist) and Executive Director of the National Association for Foot Health.

All through the book you'll find interesting discussions on corns, bunions, ingrown nails, chilblains, itching feet, etc. Not only are the symptoms of various ailments explained—but you'll find simple, common-sense treatments suggested.

In spite of the fact that winter is on full blast now, you've got to be outdoors. Measuring around in the hog lots, care of cattle, with those winter feeders coming along.

And it's no fun to have foot troubles in the winter time. That's why we would like very much for you to have this little book, "The Care of Farmers' Feet."

And see that your heavy footwear fits

Honestly, there's no other piece of footwear that can cause you more trouble than a rubber boot that doesn't fit. That's why "U. S." Blue Ribbon Boots and their makers are so strong on fit.

As a matter of fact, "U. S." Blue Ribbon Boots are made on costly aluminum lasts

which duplicate the shape of your foot precisely.

When you're in town this week, make this test yourself—slip on a pair of "U. S." Blue Ribbon Boots. Note that snug comfortable feeling around the heel and ankle. And the ball of your foot will feel as though the boot were moulded right around it. Take a few steps and notice how that "rocking-chair" curve in the sole, with the square, flat heel, puts spring into your step.

Besides, you'll be sure to notice the smooth, even flexing of rubber and lining over the instep, to avoid any danger of injury to your arches.

A real test for wear

Just to make sure that your "U. S." Blue Ribbon Boots are going to stand up under the rough usage you are likely to give them—in the Blue Ribbon testing laboratories a machine presses rubber against swiftly revolving emery, very much like holding a boot against a grinding wheel. The rubber in some footwear chafes away at the rate of 4/5" per hour. The "U. S." Blue Ribbon standard is 1/5" per hour.

United States Rubber Company

"U.S."

BLUE RIBBON

foot-saving heavy footwear

"U. S." Blue Ribbon Boots

Get one in your hands sometime. Twist it. Bend it. You'll quickly recognize its superior qualities. Red upper with gray sole, ebony black upper with white sole. Three lengths—knee, medium, hip.

"U. S." Blue Ribbon Walrus (All-rubber arctic)

This is one you'll appreciate on the coldest day. Slips right over your leather shoes. Kicks off in a jiffy. Built to stand the hardest usage. Red upper. Gray sole. Four or five buckles.

Style for the Modern Farmwife

Gaytees are the most stylish women's overshoes in the world—style authorities have said so. Many different colors and fabrics, too, to match your coat.

Gaytees come in cloth or rubber—in high or low height with snap fastener, Kwik-glide fastener, or buckles.

For Son and Daughter

Keds are the most popular rubber-soled shoes in America. They give barefoot freedom—the feet to healthy growth—the protection you want in gymnasium, basketball and wear—for indoor and outdoor use. Recommended by physical gymnasts.

PENNSYLVANIA FARMER

(205) 25

New Life for Apple Trees

By W. E. WIECKING

THERE are any number of old apple orchards in this part of the country that have been planted long enough to be bearing good and regular crops of apples, but do not, for one reason or another. Some are fairly young trees that were planted in the hope of adding to the farm income and then were neglected because the orchard work interfered with the regular farm work. Some are much older and have become scaly and unproductive. The advent of the codling moth and the San Jose scale has changed orcharding from the comparatively simple process that it was in pioneer days to a highly technical undertaking.

Not every one of these old orchards is suitable for rejuvenation. Many should be left to go into oblivion by the simplest route. However, the farm income may be materially increased with a little extra labor if the trees are of bearing age and capable of producing good crops of apples every year, if the orchard is located right, on a good soil, and the trees are of a desirable commercial variety.

Most Important Part

Perhaps the most important part of the rejuvenation process is the pruning. The object is to give them an open top and one that is low enough so that the fruit may be easily reached at picking time; also an even distribution of fruit spurs so that the trees will bear fruit in about the same amounts each year. Most old apple trees are a tangle of limbs, many of them dead. The dead limbs should be removed. Then the owner should study each tree to determine whether more limbs must be removed to open up the top so that each branch, twig and fruit spur in the center will be exposed to the life giving sunlight.

If the trees are not in a very vigorous condition, as shown by the growth of new wood, the removal of the dead limbs may be all that they will stand the first year. It may be necessary to head back a few of the leading branches and possibly some of the water sprouts also, so that they will begin to develop fruit spurs. It is the equal distribution of fruit spurs over the growth of different years that makes the trees productive annually. If an apple tree is left to itself it will have a big crop every other year and scarcely any on the alternate years. Pruning corrects this habit by stimulating the growth of new fruit spurs on the alternate years. After a few years of care in this respect the tree will produce almost as large a crop one year as another, unless frost or other factors intervene.

Dormant Sprays

After tops have been opened and the dead wood removed, the next year begin heading back trees that are too tall. On vigorous growers, like the Ben Davis, eight or ten feet may often be taken from the top-most branches to advantage. This brings the head of the tree down where it should be for economy in pruning, spraying and harvesting. It is advisable to scrape off all the old dead bark from the trunks and larger limbs, using an old hoe. In this way a breeding place for codling moth and other insects is removed.

Dormant spray for scale should follow as closely on the pruning and scraping as weather will permit. I have seen old trees take on new life and look like youngsters again in the first season following one application of lime sulphur or a miscible oil in early spring or late winter. One does not realize the amount of vitality that these small scale insects are sucking from the trees every season until he has seen the results of this spray on an old tree. For a

small orchard, the barrel type of sprayer will give reasonably good results, but the larger outfits, although they cost more, apply the spray at a higher pressure, which makes for efficiency and economy of material.

Necessary to Fertilize

In order to bring the new orchard up to the peak of its production, generally it will be necessary to fertilize. Most farm orchards were planted on rather poor soil, reserving the good soil of the farm for field crops. This type of soil usually is well supplied with potash but is deficient in phosphoric acid and nitrogen in available forms. The potash may be in such a form that it will not become available until the humus supply of the soil has been built up. Heavy application of barnyard manure is the quickest and best way to build up this humus supply and also supply plant food. If this is not available it will be desirable to keep the orchard cultivated in early summer and then plant a cover crop of rye and vetch. This crop must be turned under the following spring. In this way the humus supply will be maintained.

In addition to the cover crop, it will be necessary to add some available form of nitrogen and phosphorus. This can be done by adding from five to ten pounds of 16 per cent superphosphate to each tree. The first year four pounds of nitrate of soda and two pounds of muriate of potash per tree should be added also. This fertilizer should be spread evenly over the ground and should not be placed directly beneath the tree.

As much of this treatment as it is possible to do should be done the first year. Great improvement in the condition of the trees will be noted, however, if only the pruning and spraying portion of the program is carried out. The improvement that this causes will be sure to encourage the orchardist to try other portions of the rejuvenating process.

Trees in Wrong Place

A FINE big tree is a beautiful sight, but if it is in or by our vegetable garden it is an expensive luxury. Year after year we may plow around a tree and from force of habit hope that the roots and branches of the tree will not reduce our crops of vegetables. However, the result is inevitable. The tree always exacts its terrible toll. The worst tree of all is the gorgeous American elm. It has roots close to the top of the ground and "miles" long. Maples and oaks are nearly as bad and just as worthless.

There may be a real or sentimental excuse for a nut tree or fruit tree, but it is dollars to doughnuts that the trees should be ripped out. I like to dig a ditch two feet wide around the big trees and at least a foot away from the trunk. Then as the roots are uncovered a section of root nearly two feet long is chopped out so that digging may continue. In this way the stout part of the roots is cut away and the stump is cut from the trunk after the tree falls.

Some people just hate to cut down a fine big tree even if it is in the wrong place. The best way to overcome the dreaded ordeal is to set a few desirable trees around the home and farm buildings to make up for those that should be pulled out.

Roscoe DeBaun.

WAR against the jack rabbit last year in the West netted more than 8,000,000 skins and a profit to farmers and stockmen, from the sale of the pelts, of about \$2,000,000.

Control operations against injurious rabbits are conducted by the Bureau of Biological Survey of the United States Department of Agriculture.

AT LEFT: Fruit sprayed without KAYSO; note uneven coating. —BELOW: Note even coating on fruit sprayed with KAYSO in the mixture.

Better fruit—better prices with KAYSO in the spray!

What good are rich soil and pedigreed trees if the orchard pests get in their damaging work? And what good are expensive spray materials and labor if your fruit isn't fully protected against those pests?

A spotty spray can never be full protection. It exposes fruit and foliage to attack, or burns blotches and lowers the market value of the crop.

Then why take a double loss—on fruit and on spray materials? Use Kayso.

Twofold value of Kayso

Kayso is a calcium caseinate preparation which spreads the spray in a heavy mist that covers the surfaces evenly and completely. You're not only assured of thorough coverage, but Kayso, through its adhesive properties, makes your spray stick. Heavy dews, or even rainstorms, will not wash off Kayso-treated sprays.

And Kayso pays for itself many times over by avoiding repeat spray-

ings and losses in low grade fruit. Hundreds of successful orchardists all over the country who are getting top prices for fancy fruit have found that Kayso costs them just 2% of their total spraying expense.

Give Kayso a trial the next time you spray. It will pay its way, and pay you a profit. Ask your dealer or write to us direct for full particulars.

Planting Worries Disappear

when this machine goes to work on your farm

MCCORMICK-DEERING Potato Planters are made in 1 and 2-row sizes. With a tractor the 2-row is best. Both sizes can be operated with either tractor or horses.

The McCORMICK-DEERING Potato Planter

HERE is a potato planter that will help you to make the most of conditions this Spring. It saves a lot on costly labor, gets work done quickly, and the seed is planted just as carefully as if done by hand.

With the McCormick-Deering, your biggest job is to keep the

3-bushel hopper supplied with seed, and to steer the team or tractor. The seed chamber is open so you can see and be sure that the seed is being properly planted. Get prices, equipment information, and full details from the McCormick-Deering dealer in your town.

Put the Burden of Harvesting on the McCormick-Deering Potato Digger

It digs the potatoes, shakes dirt off, and puts them in easy-to-gather rows. Does away with a lot of hired help. The correctly designed shovel gets all the potatoes. Durable made to stand up under hard work. Write for a folder.

Club Programs That Get Somewhere

By W. R. GORDON

"TIME to plan another year's program. What shall we do this year?" That's the question uppermost right now in the minds of Grange lecturers, leaders of farmers' clubs, Farm Bureau committees and any number of other community-minded rural leaders. The writer has been conducting conferences for the past five years with groups of these volunteer workers. Recently a very successful club officer described her method of program planning. We were so impressed that we have tried to reproduce here what she told us, knowing that there are hundreds of others who would enjoy comparing notes with her. Here it is.

A Successful Leader Gives Her Idea

"How do we go about planning our club program? Your question makes me feel apologetic, for it's quite simple. But before I describe it, I want to make two observations. You see my dramatic interest makes me want to set the stage before I begin. Or maybe it's because geometry was my favorite subject in high school that I want to begin with two established principles.

The First Principle

"From observation we all know that people do not like to be assigned jobs arbitrarily. For two years I tried using such devices as 'Answer to Roll Call with a Quotation from . . . ' or called for response to some question like, 'What Invention Has Been of Most Help to the Farmers?' Practically all the men and most of the women were quite indifferent to this intellectual prod. I can yet hear them repeating, 'I have nothing to say at this time.' I came to think they were hopeless.

"Then there were assignments of recitations. I even copied them to make it easier for the members. This was little better. Some even forgot to bring the selections to the meeting, or declined to read them. What was the matter? These were normally intelligent people in my own neighborhood, who seemed to find something interesting to talk about as soon as the formal part of our meeting was over. I'd hear them discussing with animation last night's radio program, or arguing about the value placed on the 'reactors' in the Jones dairy herd recently tested for T. B. Women were talking about their children, their chickens, or what they were going to take to the bake-sale next Saturday.

"It suddenly dawned on me that my assignments were inconsistent and forced. I wasn't beginning with what our members were concerned about in

their every-day lives, but with what I thought they ought to be concerned about. Instead of building up a program, I was handing one down—doing it with worthy motive to be sure, but with no less sorry results for the club. The people who were coming to meetings were attending for something else than I was responsible for. This hurt my pride. And what of the many who were not coming at all? A part of the fault must be mine. My attitude was not that of a leader but of the reformer. It has taken some time to get to it, but here's my first principle then: 'The program of your community club must be built out of the commonly recognized interests of the members.'

The Second Principle

"For this principle take illustrations from our leaders' conference this afternoon. You recall the man who said his members only 'enjoyed serious discussion.' That they didn't care for socials and entertainments? You know without visiting that club that it's made up almost entirely of older people. Then there was the young woman on your left who said they had mostly plays, socials and dances in their club. That's a young crowd.

"Neither of these organizations is realizing anything near its possibilities. Both are doing important things, but not enough of some things and overdoing others—that is if they profess to be community clubs.

"As soon as a club limits itself to any type of activity, then all the other people who may not be enthusiastic about that sort of thing will decide to spend their time somewhere else. Every time we hold a meeting at our hall I realize that I am expecting our folks to leave their radios, a good book, some work they wish to complete, visiting with neighbors and a thousand things that they find interesting. Therefore, my second principle is that: 'Our people will continue coming to meetings as long as they are getting something they really want.'

"Most people will say, 'Of course' to both of these; and yet I tried planning programs in defiance of both of them. And I am of the opinion that there are many others doing the same thing.

Running an Organization Like Running a Business

"As you know I have been rather successful operating this farm. There is one practice I follow that has been very helpful to me. I religiously take an inventory every year. I tried this in our club. A committee met at my home one evening and together we

A Hatchet Isn't The Right Thing

You wouldn't attempt to chop down a tree 18 inches in diameter with a hatchet!

Why then cultivate your orchard with tools that can't do a thorough job and waste a lot of time trying it?

Use the Clark "Cutaway" Double Action Orchard Tiller, built especially for fruit growers. It works close to the trees where other implements can't reach and does a thorough disk-ing job.

It chops up sod and cover crops. Keeps weeds down and mulches the soil.

The disks throw the soil in opposite directions, leaving the land level. Depth of cut is easily regulated.

The disks are of cutlery steel, heat treated and forged sharp.

That's why they cut faster, penetrate easier and outlast 2 to 3 sets of other disks.

NOTE—All Clark "Cutaway" Disks are guaranteed for 3 years. If they crack or break within that time they will be replaced FREE OF CHARGE.

Clip coupon for FREE catalog which tells more about the Orchard Tiller and describes the complete line of Clark "Cutaway" disk tools. Valuable book, "The Soil and Its Tillage," included.

The Clark "Cutaway" Harrow Company, 103 Main Street, Hingham, Conn.

KELLY BROS. NURSERIES

642 Cherry St., Danville, N. Y.

took stock of our organization. We ruled off columns on sheets of paper and put headings down as follows: 'Name,' 'Age,' 'Married or Single,' 'Means of Earning a Livelihood,' 'Special Talent or Hobby,' 'Other Interests,' 'What Might They Contribute?' We were able to get 35 names on a sheet of 8-by-11 paper (typewriter size). When the task was completed this sheet set forth in striking fashion our stock in trade, our raw materials.

What Members Expected of the Organization

"Next we set about listing what services and satisfactions our members wanted. The columns headed 'Means of Earning a Livelihood' and 'Other Interests' helped us in this. Then it was we began to see how inadequate were our former programs. The pastor of one of our two local churches was under consideration. Some one mentioned that he was very much interested now in raising money through his church to erect a tablet to the memory of the World War veterans. Let's have him discuss that some evening? Then some one else suggested: 'Maybe we can lend some help to this.' We did. How about the members who belonged to the rival church? (I use rival advisedly.) Weren't they 'conscientious objectors'? Well a few were a bit 'thin-lipped'; but one of their group saw the need for some playground equipment for the school. When our help was solicited we gave an entertainment to help with that too.

"The school teacher was trying to establish a band. We could earn his help and support for our program if we took an interest in his band. And so we continued, until we saw how completely the interests of our membership were the interests of the community. When the program was complete we found we had a list of the things that our people were working for and not what we thought they ought to be working for.

Around the Year with Activities

"Now we had estimated our raw materials, the talents and abilities of our members, and had listed what would be the finished products of the future, what our members were striving to do. The next step was to plan methods of converting raw materials into finished products. I referred to my scrap books. (I am an inveterate collector of ideas, particularly of how others have done things.) We again reviewed our talent. Who could do what? Here's where we had to fight that tendency to ask everything of a small number of willing ones.

"Then each member of the committee was assigned a major project and asked to outline the year's features for that particular line of work. Then we compared notes. Suggestions were coming thick and fast now. The list was a long one and included music, plays, topics for discussion, book reviews, lectures, community improvement practices, business practices, seasonal farm questions, reports and discussions of what other organizations and individuals in our midst were doing. But every item in the program was a step in getting nearer to a few definite and important objectives. And these objectives were mostly ones that not only our club but the whole community were vitally interested in. The program planned a year in advance was the beginning of a five-year program.

"We did another interesting thing. We compiled a 'Source of Help Book,' listing every agency and organization that could furnish help or information. 'There is lots to be done yet'—there are many problems that we haven't found a solution for yet. So that is the why of our farmers' club. Here's a copy of this year's program."

I thumbed through a neatly mimeographed program wishing I might attend every one of the sessions. I know I'd get some good ideas and enjoy every minute of them.

"HEY, BILL - WHEN YEH GOIN' TO GET HEP TO Y'SELF?"

"Whata yeh mean—hep to m'self?"

"Why, man, aren't you wise yet that I got as much fertilizer on my wagon as you got on yours?"

"How come? I got four times as much on my load as you got."

"Sure, you got four times the load. I'm not talkin' about load. I'm talkin' about fertilizer!"

And, in a nut shell, that is the story of Nitrophoska. One ton contains as much plant-food as four tons of the old low-analysis goods. The user of Nitrophoska pays freight on one ton instead of four. He handles one ton instead of four. And, not only does he save freight and handling, he pays less per unit of actual plant-food. Nitrophoska (15% Nitrogen—30% Phosphoric Acid—15% Potash) is the modern fertilizer for the modern farmer. Ask your county agent. Ask your experiment station. Write us for new 16-page illustrated booklet. It tells you just the things a man must know about fertilizer if he hopes to buy wisely and economically. Send for it right now.

The NEW IDEA Automatic Feed Safety

The Most Important Spreader Invention Since the Wide-Spread Distributer

EVERYONE who has used a spreader has occasionally forgotten to throw out the feed when stopping the beaters.

The load has jammed back, choking the cylinders and perhaps breaking some conveyor part. Such trouble can no longer occur with the famous NEW IDEA Spreader equipped with the recently invented Automatic Feed Safety, which automatically stops the feed when the cylinders are stopped. Even if the driver forgets, the NEW IDEA can't forget.

THE 1930 NEW IDEA is the only spreader in the world with this practical trouble-preventing feature. Here is another instance of that New Idea leadership which has developed a continuous succession of spreader improvements, ever since the original New Idea invention of the wide-spread distributor. New Idea engineers are never satisfied with anything less than the best. New Idea Spreaders carry a year's guarantee against breakage.

There is no advance in price because of the new Automatic Feed Safety. The 1930 NEW IDEA Spreader is still sold for **\$170** F. O. B. Factory, for

The Story of Woodbine Farm

By W. D. ZINN

CHAPTER VI

ON the 28th day of October, 1876, my father, my two brothers and myself built a fence through the lower end of the farm. After having finished the job and started toward the house, my father challenged any one of his boys to wrestle with him. But we knew too much of his ability to wrestle to accept the challenge.

The following Sunday morning one of my brothers brought my father's saddle horse to the front gate and tied it to the hitching post to wait for him to ride to his appointment ten miles away. Before he got ready to start he complained of being ill. It was the first time any of us had ever heard him admit that he did not feel well. However, he continued to grow worse and on Thursday, November 2, passed away at the comparatively young age of 57.

I have known but few men who had the physical endurance that my father possessed. He was a very hard worker. Yet I have heard him say that he did not know what it meant to be tired. He was a medium-sized man, never weighing over 160 pounds. He was considered very much above the average as a farmer. He got a great deal of pleasure out of seeing the crops grow. When we think that in that day we had but few experiment stations and practically no scientific agriculture we wonder how farmers got along as well as they did.

Ready to Help

My father never became so busy on his own farm that he would not take the time to go to help a neighbor if his assistance was needed. He did not have an enemy in the neighborhood. He was very fond of jesting with his friends. His educational advantages were very limited indeed. I do not suppose that he ever went to school more than 12 months in all his life and yet he had always been a hard student. He was fond of reading and often, after having spent all day in the field at hard labor, would sit for hours at night reading by a kerosene lamp.

My mother, being a good business woman and having assisted my father in the management of his business ever since she had been in the home, was persuaded by the neighbors to qualify as administratrix of my father's estate. Because of the indebtedness against the estate this was no little task. But it is due my father to say that this indebtedness was largely brought about by his having become surety for his friends. My father, being strictly honest himself, felt that most other people were honest and would not permit him to pay their debts. As a business man, this was my father's greatest weakness.

Notes to Pay

He usually consulted my mother before making a business deal and generally heeded her advice. There were two occasions, however, when he failed to listen to her. These he deeply regretted during the remainder of his life. On one occasion a friend came to him to secure his signature to a note, which at that time, was for a large sum of money. Mother begged him not to sign the note, but he could not resist the pleadings of his friend. Later he had the note to pay.

In another instance, a certain woman had not signed a deed for a piece of land that was being conveyed to my father, although she had a prospective legal interest in the land. It was learned that this woman would sign the deed upon the receipt of fifty dollars. Again my mother pleaded with my father to

pay the fifty dollars, but he said the woman was not entitled to anything and he did not believe she would ever demand it. Again he placed too much confidence in humanity. The woman finally fell heir to one-third of the farm and demanded her inheritance. My father's failure to heed the advice of my mother in this instance cost his estate \$1,035.

As previously stated, my father owned two farms, one, a part of which is called Woodbine Farm, and the other known as the River Hill Farm. A decree of court was obtained for the partitioning of the two farms among the seven children and the widow. The River Hill Farm was assigned to two of the first set of children. The home farm was divided among the remaining five children and my mother, who was given 45 acres, which was cut off from the five parcels. Before any heir could rightly claim his piece of land he had to pay his share of the indebtedness of the estate, amounting to \$3,000.

Memories of the Sale

I was given 21 acres, but 11 acres of this was cut off for a part of my mother's dower. A neighbor, John F. Woodford, who was one of the best business men in the community, came to me after the farms had been divided and said: "Willie, you did not get anything out of your father's estate. I would not pay the indebtedness against it for all you get. I would go off and leave it." I explained to him that if I did that and the ten acres of which I then had possession, did not bring the debt, the court would sell the 11 acres on which my mother's home stood and she would be homeless. "I did not think of that," remarked my neighbor. "You stick to it and I will help you out." After buying two heirs out I was still worse in debt, but this good neighbor became surety for me for \$1,000 in spite of the fact that he did not believe the farm worth the debts.

Nothing is more vivid in my mind than the day of the public sale of our personal property. It was during the late fall of 1876 when prices of livestock were as low as I have ever seen them. Good horses were sold for \$50 and \$60. The auctioneer was a neighbor who had much sympathy for our family. When one of them made a bid he was not slow in "knocking the article down." In my imagination I can see my poor mother yet, as she stood there and bid on furniture which she paid for with money earned by her own hands.

I resolved that such a thing should never occur in my home should I leave a widow behind. Ever since we have had anything my good wife's interests have been safeguarded, first by carrying a life insurance policy when I was deep in debt and later by making a will that gave to my wife what rightly belonged to her.

Again, in my imagination, I can see the family circle the night after the sale, when my mother was listing the property she had bought that day and found that it amounted to \$640, not a dollar of which was in sight. Nevertheless, she lived to see every dollar of the debt paid and to enjoy with her son a new and modern house, where she made her home for many years until her death. This did not occur until nearly 40 years after my father had gone to his reward. Her heart often overflowed with gratitude when she spoke of our poverty during the eighties and com-

IMPOSSIBLE" Said These Farmers

When they saw the "Weed Hog"

Pennsylvania farmers have always wanted a tool that would do the things the WEED HOG does but they never believed such a tool could be built. When the WEED HOG was introduced to them, they saw it was a machine that would work among stones and in hard, stunted stubble with a quick bending, stretching or breaking they called it "impossible." The impossible was achieved before their eyes. They saw the WEED HOG at the State College and on their own farms and orchards work under rocks, stones, stumps and on hard stubble. They were amazed—for not a tooth stretched or broke. They saw the WEED HOG rip up orchard sod under cover. They saw the WEED HOG tear out grain and stubble and mix it with the soil, leaving a fine, uniform seed bed. They saw the WEED HOG work plowed and unplowed land, breaking up clods and lumps, and watched it break up hard, stunted stubble and mix it with the soil, leaving a fine, uniform seed bed. They saw the WEED HOG work plowed and unplowed land, breaking up clods and lumps, and watched it break up hard, stunted stubble and mix it with the soil, leaving a fine, uniform seed bed.

OUTSTANDING FEATURES
STRENGTH: The WEED HOG is built entirely of tempered spring steel. Teeth are **GUARANTEED FOR LIFE** against bending, stretching or breaking, even in the most compact soil.
CAPABILITY: Teeth may be spaced on wheels or on a bar. A few from a few feet to full plow depth.
EASE IN TRAIL: The WEED HOG is built with ample clearance and no front bar to drag. It works plow depth in trash, straw, and manure with practically no clogging.
WORKS IN ANY SOIL: The WEED HOG has a rugged but extremely flexible frame that permits it to work under all soil conditions.

PENNSYLVANIA FARMER

pared it with the blessings we later enjoyed. I was more than \$3,000 in debt. Such an indebtedness in the eighties and nineties was harder to pay than a \$10,000 debt would be today. There were but few banks and money could hardly be had at any of them. If there was any one thing more than another that helped me to pull through those panic years it was that I had gained a reputation for being prompt in meeting my obligations. I was paying ten per cent interest on a part of the money I had borrowed. The \$1,000 for which my good neighbor, Mr. Woodford, had become surety was borrowed at 6 per cent to pay off that indebtedness.

Good Neighbors

I was fortunate in having a number of other good neighbors. About 45 years ago, E. R. Dyer came into our community and became my nearest neighbor. For a long time we owned a 600-acre farm in partnership and would buy and sell the stock together. I have never asked him for a favor that he did not grant. Sometimes he insists that I have done more for him than he has for me, but of that I am extremely doubtful. In 1899 we were building the barn on the farm and I became so crowded with work that I was not getting my corn cultivated as it should have been. One morning I looked across at the field, that at that time was green with weeds, and I beheld all Mr. Dyer's force with his teams in the field plowing and hoeing the corn. I shall never be able to repay him for what he has done for me. I feel that this story would not be complete without the mention of his kindness and neighborliness.

Grain for Sheep

MR. D. asks: "When shall I begin to grain my sheep that will drop lambs in March?"
Unless he has been feeding them legume hay and they had a bluegrass sod on which was left a good growth of grass last fall, he has already lost some time. Even if they have all these things they should have grain six weeks before they are due to lamb.

We have one flock of sheep due to lamb about the first of April. They have a good bluegrass sod with a supply of grass left on the ground last fall and all the second crop of red clover hay that they want to eat. We expect to begin to feed grain about the middle of February. We have another flock with more grass than they can possibly eat and good mixed hay and some timothy and orchard grass that were cut before either came into head, and that hay would analyze from 15 to 17 per cent protein, which is higher in protein than the clover hay. This flock is due to lamb about May 1.

My readers will wonder why they were bred so late. The answer is that they are on a farm whose altitude is 3,300 feet, and we are apt to have snow flurries during April, and we can save a larger percentage of lambs by their coming at that time.

OLD Peter Skinfint has some very peculiar ideas about feeding livestock. He believes that it makes no difference if the cattle lose 200 pounds during the winter. They will have all summer to take it back on. He says he has noticed that when cattle lose 150 to 200 pounds they always gain more when they go to grass. He does not seem to realize that it costs twice as much to put on a pound that the animal has lost as to put on an additional pound.

He says his father fed timothy hay and corn to his milk cows and he would not show disrespect to his father's memory by changing the feed right on the farm where his father lived for 75 years. He never docks his lambs. He says if the Lord had intended that sheep should go without tails He would have created them that way.

Home Garden Collection of Vegetable & Flower SEEDS

Special Offer
50 Large 10c Pks.
\$1.00

50 LARGE \$1.00 PACKETS

All Are Full Size 10c Packets

Here's What You Get for Only \$1.00

In order that you may have the opportunity of trying this most amazing collection of seeds, we give you this entire \$5.00 collection for only \$1.00. It is our method of advertising. We want to establish new regular customers who will buy from us year in and year out. All seeds are new and fresh and have been grown especially for us. Our money back guarantee protects you against risk.

The collection consists of: Beans, Peas, Beets, Lettuce, Cabbage, Tomato, Radish, Onion, Cucumber, Parsley, Pepper, Squash, Flower Seeds: Nasturtium, Aster, Sunflower, Cosmos, Zinnia, Marigold, Morning Glory, Four-o'clock, Sweet Pea. Each packet is guaranteed to be regular full size, thereby making this a very sensational offer. Order today while the supply for this introductory bargain offer lasts—Act at once, because this bargain is sure to be snapped up by many readers of this magazine.

How To Order—Send No Money

Do not send a single cent now! Just sign your name and address (write plainly) to the coupon and rush it to us. We will send you a box of 50 large packets as described above by return mail. Pay postman only \$1.00 plus postage on arrival.

Future Farmer War of Words

BELIEVING that public speaking contests are valuable in developing leadership, Senator Arthur Capper, through the Capper Farm Press, has agreed to offer \$1,100 in cash prizes to be awarded four young orators who will represent their respective regions in the final of a nationwide speaking contest put on by the Future Farmers of America, a nationwide organization of students of vocational agriculture. In addition, expense of the four contestants to Kansas City will be paid, the total expenditure being about \$2,400.

The first annual National Public Speaking Contest will be held in connection with the congress of vocational agriculture students in Kansas City during November of this year. State elimination contests will first be held, the winner to go to a regional contest, where a contender for the prizes will be named. These regional contests must be held before October 15. Regions are divided, with one finalist from each, as follows: North Atlantic, 13 states; Central, 12 states; Southern, 12 states; Western, 11 states. State, regional and national contestants will be allowed to select their own subjects but the subject must be related to agriculture.

Only members of the Future Farmers' Association which has a membership of 75,000 or more farm boys, will be eligible for the National Public Speaking Contest. First prize will be \$500; second, \$300; third, \$200; fourth, \$100. The national contest will be broadcast over the nation-wide network of radio stations.

Elimination contests in the various states will be under direction of state supervisors of vocational agriculture who will also conduct the regional contests in cooperation with Federal leaders. The National Future Farmers' Speaking Contest will be supervised by Dr. C. H. Lane, National Director of Vocational Education, and John F. Case, editor of The Missouri Ruralist, as chairman of an editorial committee representing the Capper Farm Press.

Why We Have Valentine Day

THERE once lived an old man named Valentine. He was always kind to every one. He visited old people and helped the poor. He often sent little messages to his friends.

There used to be no postman to carry mail, so Valentine sent his messages by pigeons. He took great pains in teaching them to go to the houses of his friends. They never made a mistake. In this way he made people happy.

Every one loved Valentine except the king. He hated Valentine because of his kindness. One day he called his guards and told them to seize Valentine, and put him into the blackest dungeon in the castle. This they did, and the cell into which he was put had but one window.

Early in the afternoon he heard a soft cooing, and looking out he saw one of his pigeons, and he remembered he had not sent any messages that day. There was a little girl and a

sick old man who waited for his messages every day. Valentine had no pretty cards. But there were some violets growing between two stones of the window ledge. He also remembered a few scraps of paper in his pocket. He tore the paper into heart-shaped pieces, because the heart means love, made two tiny holes in each, and drew the violets through. The pigeons then took them to his friends.

Valentine, however, was soon released from the prison, because the king died and the new king was kinder. The people were glad when he was released and soon began to send messages, too. After Valentine's death his friends sent messages on his birthday, the fourteenth of February. That is why, each year, we send cards called Valentines, to our friends.

Submitted by Luella Stacey, Pennsylvania.

Abraham Lincoln

By Gertrude Wilson, New York

TO me, Abraham Lincoln will ever be the greatest American and the greatest President in all history. The spirit of honest Abe, the rail-splitter, is the true spirit of our nation—loyal, strong and, above all, just.

Can't you picture this man—tall, loose-jointed, awkward; yet with a certain grace and gentleness seldom seen in a man? Picture him on a November day striding over a stubble field, his dark, black hair whipped back from his forehead, his ill-fitting rusty-black coat twirling about his legs. A gigantic scare-crow in the wind! He leaves huge tracks behind imprinted in the soft ground.

Where is he going on such a cheerless day? 'Tis hard to say. But tonight when the snow begins to fall and there is a silver coat upon the brook there will be many miserable people made happier by a visit from Abe Lincoln. Medicine for a sick woman, a warm shawl for a shivering child, food for the starving.

When I think of this man—his kindness, his patriotism, his honesty; I always recall the story of a poor little girl who said of him, when he brought comfort to her miserable home: "God came, and his name was Abe Lincoln."

Lincoln's Steps Up on Failures

A YOUNG man ran for the legislature of Illinois, and was badly swamped.

He next entered business, failed, and spent 17 years of his life paying up the debts of a worthless partner.

He was in love with a beautiful young woman, to whom he became engaged—then she died.

Entering politics again, he ran for Congress, and was badly defeated. He

then tried to get an appointment to the United States land office, but failed.

He became a candidate for the United States Senate, and was badly defeated.

Then he became a candidate for the Vice-Presidency and once more was defeated.

One failure after another—bad failures—great setbacks.

Then he rose superior to all discouragements and disappointments, and became one of the greatest men of America—Abraham Lincoln.

CONUNDRUMS
Why is a caterpillar like a pancake?
Because it's the grub that makes the butter-fly.

What is the difference between a cat and a match?
The cat lights on its feet, and the match on its head.

How many tails has a cat?
Three. No cat has two tails; one cat has one more tail than no cat, therefore, one cat has three tails.

How do you make a Maltese cross?
Pull its tail.

When does a chair dislike you?
When it can't bear you.

When is a chair like a lady's dress?
When it's sat-in.

Why is a dirty child like flannel?
Because it shrinks from washing.

SHREWDNESS
If the head of Lee's army is at Martinsburg and the tail of it on the plank road between Fredericksburg and Chancellorsville, the animal must be very slim somewhere. Could you not break him?—Telegram, Lincoln to General Hooker, June 14, 1863.

Little Folks' Corner

My Pets

OVER since a tiny child I have had pets, some of these have been chickens, dogs, horses, cats, calves and kittens. I think the most loved of these were a pet hen and rooster. Dorothy and Jimmy, and a cat named "Hokey." Dorothy and Jimmy were Buff Orpingtons. My older brother was home one summer and spent most of his time killing and feeding flies to Jimmy. Jimmy seemed to like them.

Another cat I remember having was Rowena. Her name came from the book "Ivanhoe" which we were reading in school then. Rowena lived up to her name for she was certainly a beauty and the only cat I ever had that refused to be petted.

Although a sophomore in high school, I still love animals; now I have a black kitten, "Midnight," two calves, Jimmy and Bessie, and a tiny rat terrier which we call Jerry.

I seem to be the only one in our family who cares for cats, dogs and the like. The others usually object to stumbling over pans of feed at the door and sitting down on a cat.

Mary Barber, Pennsylvania.

My Pet Hen

I HAVE a hen named Boots. She is about two years old. When she was a little chick she had her leg broken and I put her in a box in the house. After she got well I let her run into the yard. Each evening she would come up to roost but instead of going to her box she would sit on my brother's shoulder and want to roost there.

After she was older I put her in a coop with some turkeys, pigeons, guineas and other chickens. We called them Boots and her Buddies. All of the other chickens died except Boots and one other chicken. We call-

Some Sayings of Lincoln

We cannot escape history. Revolutionize through the ballot box.

Let none falter who thinks he is right. It is no pleasure to me to triumph over any one.

Come what will, I will keep my faith with friend and foe.

All that I am, all that I hope to be, I owe to my angel mother.

There is no grievance that is a fit object of redress by mob law.

Suspicion and jealousy never did help any man in any situation.

FEBRUARY

The historical little month is here. Which gave to us two men so dear: George, the Father of this Yankee lad, And Abe who saved it from disband.

Two holidays thus have been made. When tribute to these great men is paid, So in spite of all its ice and snow, A welcome to this month we'll show. Written by Beatrice Shreiner, Pennsylvania.

Cecil county, Md.

A Fox Hunt

I HAVE two goats and am having much fun with them. They are Nanny and Bill. I also have three other pets.

I go to school at Muddy Creek. I have plenty of books and study them well. I am but 11 years old and in the seventh grade.

It is lonely out here in the country without anybody to play with.

Last week we went fox hunting. My teacher went too. We had much fun. We took our dog, Sport, who won a prize at a show in Burnsville. He won a silver cup. We also won two blue ribbons.

I am going to go to Florida for a vacation after I am through school. Then I am going to study art in England. Beatrice Phillips, Greene county, Pa.

Our Pictures

THE cats on this page are pets of Bernice Schmader of Pennsylvania, who drew their pictures. The pup belongs to Brother Benjamin.

This two-year-old produced 15,000 lbs. milk on Quaker Feeds. Owner, Carl G. Womster, Union Hill, N. Y.

Your Profits Depend Upon the Quantity and Quality of Milk Your Cows Produce—

AND getting quantity and quality into your milk production is a matter of proper feeding. Dairy men who are making the most money are those who have abandoned catch-as-catch-can feeding methods and have gone in 100% for Quaker Dairy Rations. That's because every ingredient that goes into Quaker Dairy Rations is carefully selected for a definite purpose—to help make more milk of the finest kind and lots of it.

For maximum production at the lowest possible feed cost, Quaker 24% Dairy Ration is a splendid, scientifically blended, always-uniform mixture that will give you excellent results. The Quaker Dealer in your community has it for you.

THE QUAKER OATS COMPANY, CHICAGO, U. S. A.

Quaker Sugared Schumacher—is the complete carbohydrate feed; combines perfectly with any Quaker high protein concentrate (24%, 20% or 16%). A choice feed for all young or dry stock; an entire grain ration for horses, steers, lambs and swine.

Farm and Dairy

By L. W. LIGHTY

AN even blanket of snow covers the flower garden and all the rest of the land fifteen or more inches thick, but that does not affect memories or chill anticipations. There are ten thousand dormant buds under this snow, all ready to spring up as soon as the sun slips north of the Tropic of Cancer. Indeed there are a number of times ten thousand. The columbines themselves will foot up ten thousand. I wonder how many flower lovers have learned the wondrous loveliness of this very hardy perennial.

To start with, it is pest proof like the iris and peonies. Give it half a chance and it will propagate itself and creep along the ledge into the tree-covered area if it has only a bit of sunshine. Even grass and weeds will not discourage it. Proudly it lifts its head among the iris and peonies with the most lovely and delicate fern-like foliage. The long spurred blooms on long and almost invisible stems swing and sway to the lightest breeze, shimmering and scintillating like so many giant precious stones of rare value. The dazzling splendor of a large stretch of these plants in full bloom is too enchanting for words.

Endless Varieties

Of varieties there seems no end, because they readily hybridize and new things come to enchant you every year. The blooms have a deep cup of nectar. This above all other flowers attracts the ruby-throated humming bird and a number of them are hovering about all the time this plant is in bloom. A pair of these mites of bird life made a cute little nest 15 feet from the ground and not that far from the bedroom window last summer. While they covered their tiny specks of eggs and brooded the young not larger than a potato bug they all the time had a "birdseye" view of nearly a tenth of an acre of these charming flowers so rich in nourishment for them and their family. Hundreds of folks looked at the nest and assured me it was the first they ever saw. When the young ones flew out they were quite tame and seemed to play hide and seek for some weeks in the garden, but as the blooms became scarce they withdrew. Ere many weeks they will be with us again. Anticipations.

The columbine is a wild flower that belongs to us. The red columbine grows in many a partly wooded gravelly ridge where plants and seed can be secured. The plant grows 18 inches to two feet tall and blooms very profusely, being the earliest of them all. The color is a variable red, some are deep orange, ranging to almost maroon, but always there is a rich golden throat. The wild columbine of the Rocky Mountains is a sky blue, but also like ours, is variable, often running lighter to white. It is the state flower of Colorado.

No State Flower

Will Pennsylvania ever have enough esthetic pride to adopt a state flower? It is the only state in the Union without one. Let every flower lover insist our legislature give us the iris as our state flower. It grows wild here. We are growing millions and can grow billions to enhance the beauty and desirability of every home with ground about it.

In and adjacent to what my geography called the American Desert, but now we call Arizona, New Mexico, etc., a golden yellow columbine grows wild. Folks botanically inclined tell us there are a few dozen species and many varieties. Hybridizers have taken these flowers in hand and in many ways changed and improved them. At our place we have the tall (40 inches) and very large extra long spurred kinds on one side of the house and the wild or native kinds on the other.

The ruby throat, after finishing the reds, whirls to the multi-colored large ones and of course brings the pollen with it, so we have, as a result of this crossing, endless colorings and tinting as well as a great variety in shape and form. Some are double almost like a little rose, others are semi-double and very large with the most unusual color combinations. Many stray plants from seed come in the iris beds and give us a great surprise, being different from anything we ever had in the garden.

I presume an "expert" could hedge in the columbine with a lot of difficulties. He would, no doubt, find a lot of bugs, worms, borers, etc., to fight, but in our garden and on the woodland knolls where columbines have thrived for years and years, not a thing ever molests them.

He would grow seedlings and do transplanting and divide large plants to increase them, all of which can be done, but it is difficult, and the columbine somewhat like the poppy, does not want to be monkeyed with much. Sow the seed where you want the plants and let them grow in their own way; you will have no trouble but endless pleasure.

When to Sow

The seed may be sown in the early spring or in the early autumn; that is the time the plant does its sowing. If your soil is inclined to be dry the little seedlings may need water. The seed is very small and like all small seeds, should be covered with rotted leaf mould or woods soil and the germination will be splendid.

The early autumn sown seed often blooms the next summer, but the spring sown rarely. It makes a good stalky plant and gives a big harvest the next season and at least one season following. The native reds seem to be true perennials, but some of the hybrids come nearer to being biennials. That is to say, they give us one season of great bloom and then decline and after another year are gone.

The columbine seems to prefer a loose light soil of a gravelly nature, but we grow some in very heavy stiff clay. They behave splendidly there, but they will not thrive in a wet or soggy place.

We found the columbine made a grand border for the iris or peony beds. The peony is a rather stiff or rigid style grower with gigantic blooms, so these lithe flexible female plants with the blooms swaying on almost invisible stems, give a grace and buoyancy that is very pleasing. We use them freely for this purpose as well as in solid areas.

Columbine, iris and peonies make a trio that has given us endless garden pleasure, because they are perfectly hardy, permanent, pest proof and care for themselves under all conditions. They bloom in April, May, June and into July. They are very excellent as garden or cut flowers.

In shape, form, color, shade and tint there just seems no end and in brilliancy none surpasses them. Indeed about every farm house there should be a goodly area of these glorious flowers. They do not increase your work but lessen it, as joy and pleasure lessen work by making it more delightful. Once established they stay there winter and summer, giving annual crops of pleasure.

IN the last few years there has been a great increase in the demand for legume hays on the part of the dairy industry, especially for alfalfa hay, because of their high value as food, their value in balancing the ration, and the economy in using them, says the Bureau of Agricultural Economics, U. S. Department of Agriculture.

Dairymen at Harrisburg

PENNSYLVANIA dairymen turned out in full force to their annual meeting at Harrisburg this year. A fine program had been arranged by Robert Brinton, president, West Chester, and R. H. Olmstead, secretary, State College. Live discussions followed the presentation of each subject and the general feeling was that this was one of the best programs in the history of the association.

President Brinton gave a clear, comprehensive summarization of the present dairy situation.

"Electric Refrigerators in the Cooling of Milk" was discussed by R. U. Blasingame, of State College. Much interest was manifested in this comparatively new method of cooling milk. A number of firms are now putting out farm sized outfits and the indications are that the use of these electric refrigeration units will increase rapidly.

Dry-Fed Calves

C. B. Bender, New Brunswick, N. J., told how they had successfully raised dairy calves for eight years at the New Jersey Agricultural Experiment Station on dry-fed calf mixture composed of 100 pounds of yellow cornmeal, 150 pounds of ground oats, 50 pounds of wheat bran, 50 pounds of linseed meal, 50 pounds of soluble blood flour, four pounds each of steamed bone meal, pulverized limestone and salt.

The calves are allowed to suckle their dams for 48 hours. They are then weaned and receive a maximum of three quarts of milk daily. When the calves are one week old a little of the dry mixture is put into their feed boxes after each milk feeding. When the calves are three weeks old the milk is diluted with water so that by the end of 30 days the calves are subsisting on one pound of the dry-fed mixture, legume hay and fresh water. The allowance of dry-fed mixture is gradually increased so that by the fifth month the calves will be consuming five to six pounds daily.

"Nutritional Aspects of Milk Production" was discussed by R. A. Dutch, of State College. The role played by Vitamin A, B, C, D, E and G in nutrition was described and illustrated in a very interesting way by the use of lantern slides.

Undulant Fever

"The Truth About Contagious Abortion and Its Relation to Undulant Fever" was presented by E. M. Harmon, Des Moines, Iowa. A report of his address was published in this paper last week.

Even though the danger of undulant fever from unpasteurized milk is comparatively small, yet dairymen and boards of health are taking active steps to eliminate any possibilities of infection of humans from raw milk. The American Association of Medical Milk Commissions, which supervises the production of "Certified Milk," has passed the ruling that no dairyman may produce certified milk unless his herd is tested for Bang's disease, as it is known in cattle, and all reactors removed. The Philadelphia Board of Health has ruled that no raw milk may be sold in the city except from tested herds from which all reactors to the agglutination test for Bang's disease have been eliminated.

Doubtless other cities will also take similar action and observe every precaution to maintain a pure and wholesome milk supply throughout the country.

A. A. Borland.

As For Barn Equipment—

WILLIAM LOUDEN
"Agriculture generally is under a debt of gratitude to William Louden for his developments during the last 50 years, in labor-saving, barn equipment. He is one of the outstanding figures among those who have done most for the betterment of farm life and farm working conditions."
The late E. T. MEREDITH
Former U. S. Sec'y of Agriculture.

That Question Is Easily Settled

The better the judge, the surer the selection of Louden. Because this good equipment completely answers every purpose for which modern barn equipment is required. Noted for years for its animal comfort, superior steel, correct design, sanitation, simplicity and clean cut appearance.

Louden better barn equipment is designed to give more years of good service than any other equipment ever made. Thousands upon thousands of successful farmers are proud to say that their barns are Louden equipped. So it has been for more than 60 years. Before you buy barn equipment send to Louden for descriptive printed matter.

If building or remodeling any farm building, let us help you with your plans. You can benefit from our long experience in helping thousands of other farmers plan new buildings and improvements. Check the service or the equipment you are interested in and mail the coupon today. Prompt information, no obligation.

A Real . . . Cow Conditioner

A tested formula of Iron, Herbs and Roots

Do not confuse KOW-KARE with so-called stock foods and tonics, which frequently bring temporary stimulation—with little or no lasting effect. KOW-KARE is in no sense a food. It is a concentrated bleeding of iron, the great blood purifier and builder, and potent medicinal herbs and roots. KOW-KARE acts directly on the digestion and assimilation—builds natural vigor to convert heavy diet into maximum milk yield.

CAN it be you are still in doubt—still wondering whether it really can pay to spend money to condition your cows for the long grind of barn feeding? If so, go to your nearest KOW-KARE dealer and ask him who are the dairymen right around you who have found KOW-KARE profitable to use. Ask him what they say about this remarkable conditioner.

The answers are likely to surprise you. Maybe they will throw some light on certain dairy successes you've wondered about among your neighbors. The man who sells KOW-KARE is in a position to KNOW. He knows, for instance, that growing and repeat sales must have a reason—and he hears a lot of first-hand KOW-KARE experience from cow owners who are well-known to him.

The Common-sense way to meet uncommon strains

Aside from the well-known uses of KOW-KARE in the various cow disorders that sap the profit margin from the dairy income—the aid of this potent conditioner during winter feeding is becoming known to new thousands of cow owners yearly. Your animals cannot suddenly change from all the favorable conditions of outdoor life and green pasturage to housed-in life and dry, rich, hard-to-digest diet without a terrific added strain.

It is in the relief of this strain that KOW-KARE finds its largest and most profitable use. At a cost of only a few cents per cow per month a vitalizing aid is added to the diet—a genuine conditioner of the digestion and assimilation. With this inducement to health and vigor more feed is turned into profitable milk volume. Instead of running your cows down to the danger point or actual breakdown, milk profits come easier. There's a health bonus that pays many times the small investment in regular KOW-KARE conditioning.

Prepare your Cows for Calving

It is no longer good business to leave the health of valuable cows at calving time to chance. Use KOW-KARE two or three weeks before and after and you will be surprised how easily your cows come through without the disorders and production losses cow owners rightly dread. The organs of production when invigorated to function normally seldom become the prey of disastrous troubles at calving.

Full directions for use on each KOW-KARE can. Two sizes, \$1.25 and 65¢—at drug, feed, hardware, and general stores. If your dealer is not supplied we will mail, postpaid.

Orphan boys' calves win five prizes at State Farm Products Show at Harrisburg. Photo of the Hershey Industrial Schools' calves at the State Farm Products Show at Harrisburg where the boys won five prizes, taking second, third, fifth, eighth and ninth places by the following boys respectively, John Kohr, John Savage, Robert Evans, Charles Emerick and Bruce Hiler. These boys are all orphans and prodigies of M. S. Hershey, the chocolate king, at his orphanage at Hershey, Pa.

Cow-Testing Assn. Reports

Titusville
THE Titusville Cow-Testing Association closed its fifth year December 31, 1929, with 19 whole-year members, and one part year member. There were 323 cows in the Association during all or part of the year.

The result for the Association for the five years is as follows:

| Year | Lbs. Milk | Lbs. Fat |
|------|-----------|----------|
| 1925 | 7510 | 291.1 |
| 1926 | 7396 | 288.9 |
| 1927 | 7154 | 291.3 |
| 1928 | 7557 | 300.3 |
| 1929 | 7783 | 311.0 |

Twelve herds with an average of five cows or more exceeded an average of 300 lbs. of butterfat. A complete list follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|------------------|---------|-----------|----------|
| James M. Kelley | R.&G.H. | 7518 | 306.0 |
| Clyde Kelley | R.&G.H. | 9975 | 346.1 |
| J. D. P. King | R.G. | 6326 | 342.9 |
| O. T. Ongly | R.H. | 10301 | 355.6 |
| A. K. Hummer | R.H. | 8297 | 334.1 |
| Robert Lewis | Mixed | 8395 | 330.9 |
| Albert Hasbrouck | R.&G.M. | 9233 | 320.7 |
| M. L. Penlon | R.&G.G. | 6325 | 312.3 |
| Norris L. Reed | R.&G.J. | 6347 | 310.2 |
| Will Hasbrouck | R.H. | 9506 | 310.1 |
| M. W. Beers | Mixed | 7474 | 302.9 |

One member with less than an average of five cows produced over 300 lbs. butterfat.

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|----------------|-----------------------|-----------|----------|
| William Howard | R.&G.J. | 8501 | 373.0 |
| Byron Blakely | C. D. Sprout, Tester. | | |

Sparta-Saegertown
THE Sparta-Saegertown Cow-Testing Association closed its first year December 31, 1929, with 22 whole-year members and four part-year members. There were 353 cows in the Association during all or part of the year.

Seven herds with an average of five cows or more exceeded an average of 300 lbs. of butterfat. A complete list follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|----------------|---------|-----------|----------|
| J. G. Sherred | R.H. | 10915 | 339.1 |
| Merle W. Ongly | R.&G.H. | 9990 | 333.2 |
| Harry E. Pirth | R.&G.H. | 8817 | 313.7 |
| Burl Hayes | R.&G.H. | 8413 | 312.8 |
| Roy M. Bewley | G.H. | 9329 | 310.8 |
| Arthur Morris | G.H. | 8857 | 307.0 |
| J. L. Goodwill | G.H. | 8057 | 301.3 |

Alva Love, C. D. Sprout, Tester.

Sullivan County
THE Sullivan County Cow-Testing Association closed its ninth year December 31, 1929, with 19 whole-year members. In addition five members were in the Association only part of the year. The total number of cows for all or part of the year was 292.

The results for the Association for the nine years are as follows:

| Year | Lbs. Milk | Lbs. Fat |
|-----------|-----------|----------|
| 1920-1921 | 5,637 | 228.7 |
| 1921-1922 | 6,025 | 222.6 |
| 1922-1923 | 6,204 | 210.9 |
| 1923-1924 | 6,388 | 230.9 |
| 1924-1925 | 7,378 | 271.6 |
| 1925-1926 | 8,594 | 312.1 |
| 1926-1927 | 8,022 | 294.5 |
| 1927-1928 | 8,263 | 295.1 |
| 1928-1929 | 8,570 | 306.3 |

Ten herds with an average of five or more cows exceeded an average

production of 300 lbs. of butterfat. A complete list of these herds follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|-----------------|---------|-----------|----------|
| C. V. Driscoll | R.&G.H. | 12086 | 407.2 |
| Thomas Doyle | R.&G.H. | 11085 | 384.2 |
| J. W. Adams | R.&G.H. | 10293 | 371.4 |
| J. W. Kneller | R.H. | 10945 | 367.6 |
| F. V. Rohe | R.&G.H. | 11187 | 357.3 |
| Litzelman Bros. | R.&G.H. | 9873 | 338.1 |
| F. J. Murphy | R.&G.H. | 9566 | 335.6 |
| Taylor McCarty | R.&P.H. | 9106 | 319.3 |
| William Tubach | R.&P.H. | 8883 | 312.7 |
| Milton Taylor | R.&G.H. | 8375 | 305.4 |

M. A. Drayer, J. W. Learn, Karl Bower, County Agent.

Carbon County
THE Carbon County Cow-Testing Association finished its fifth year December 31, 1929, with five members. The total number of cows for all or part of the year was 111.

The result for the Association for the five years is as follows:

| Year | Lbs. Milk | Lbs. Fat |
|------|-----------|----------|
| 1925 | 8650 | 353.4 |
| 1926 | 10378 | 365.6 |
| 1927 | 9751 | 346.7 |
| 1928 | 9567 | 335.7 |
| 1929 | 10078 | 312.7 |

Three herds with an average of five or more cows exceeded an average of 300 lbs. of butterfat. A complete list follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|-----------------|---------|-----------|----------|
| L. A. Zimmerman | R.&G.H. | 13,691 | 442.8 |
| Wm. Steigerwalt | R.&G.H. | 10,243 | 366.1 |
| Harry J. Delong | R.&G.H. | 10,079 | 340.8 |

Eighteen cows produced over 400 lbs. butterfat.

Francis L. Sattizahn, Nich. M. Rahn, Tester.

Clearfield County
THE Clearfield County Cow-Testing Association finished its third year December 31, 1929, with nineteen whole-year members, and eight part-year members. There were 405 cows in the Association during all or part of the year.

The results for the Association for the three years are as follows:

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1927 | 202.75 | 5819 | 216.9 |
| 1928 | 201.58 | 6929 | 237.0 |
| 1929 | 221.08 | 6441 | 233.6 |

Six herds with an average of five or more cows exceeded an average production of 300 pounds of butterfat. A complete list of these herds follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|-------------------|---------|-----------|----------|
| Mrs. J. A. Liddle | Mixed | 8706 | 303.8 |
| John Flood | Mixed | 7317 | 339.7 |
| S. R. Thompson | Mixed | 7712 | 331.8 |
| William Ballor | Mixed | 7860 | 327.0 |
| G. B. Washob | R.H. | 7476 | 303.2 |
| C. O. Mattern | R.&G.G. | 6364 | 302.3 |

High Guernsey Herd

THE registered Guernsey herd belonging to Farmhill Dairy, owned by Mrs. Henry R. Rea, Allegheny county, Pa., was the highest producing

Everything
that a Silo
can have—

plus SAFETY

That's the Unadilla—the most popular silo made! Here is a real tower of strength! Great, strong, steel cables imbedded in concrete hold the Unadilla erect, steady and firm on its foundation. So easy to erect that a handy man and a boy can do it easily and quickly.

Easy and safe to climb as walking upstairs for the patented door fasteners form a convenient, permanent ladder of wide, low, safe rungs directly under the openings. The doors open automatically when the fasteners are raised. They do not freeze in or stick, yet are water tight and frost repelling.

The most famous dairy farms use Unadilla! Why not you? Send for big, free, illustrated catalog today; also prices, terms, etc. Real discounts for cash and early order. Don't wait—get in line for a Unadilla now and settle your silo problem for good!

Guernsey herd enrolled in the Dairy Herd Improvement Associations of Pennsylvania during 1929. The average production of this herd of eight cows was 9,748 pounds of milk and 471.8 pounds of butterfat.

At the Farm Products Show at Harrisburg Mr. Corey C. Garey, herdsman at Farmhill Dairy, received the beautiful silver plate awarded by the Eastern Guernsey Breeders' Association in recognition of the production at Farmhill.

During their four years of dairy herd improvement association work Farmhill Dairy has had an average production of more than 400 pounds of butterfat each year.

Tom P. Whittaker, Tester.

Official Jersey Tests

POGIS' P. V. Farm Susie 395666, a pure-bred Jersey cow in the herd of Highland Farms, Westmoreland county, Pa., has completed her first official production test in which she yielded 561.74 pounds of butterfat and 12,206 pounds of milk in 365 days. Susie was started on this test when she was eleven years and eight months of age and with this record qualified for the Register of Merit of the American Jersey Cattle Club. Her sire is Papis 99th of Hood Farm 7th, and her dam is Nellie of Meadow Brook.

Torono's Blossom of H. F. 527779, another Jersey owned by Highland Farms, has completed her first official production test in which she yielded 435.52 pounds of butterfat and 8,426 pounds of milk in 365 days. Blossom of H. F. was started on this test when she was six years and eleven months of age and with this record qualified for the Register of Merit. Her sire is Blossom's Torono, and her dam is Landseer's Blossom 3d. A. J. C. C.

Feed for Jerseys

I am writing in regard to feeding our Jersey cows, so as to get the greatest production at the minimum of cost, using the grain and roughage we produce on the farm.

We have silage, clover, clover and timothy mixed, also shredded corn fodder, but the fodder is not good as our corn was late and the early frost caught it before it was matured; it never dried out with all we could do to prevent it but heated more or less. We are feeding some of the best and using the balance for bedding. As for grain, we have corn, oats, a little buckwheat and cottonseed meal.

J. W. McIntire.

I would suggest the following grain mixture for your cows to be fed with as much silage, clover or mixed clover hay and shredded corn stover as the cows will eat up clean two or three times daily:

100 lbs. corn meal, or corn cob meal or ground buckwheat or portions of two or more, 100 lbs. ground oats, 100 lbs. buckwheat middlings, 100 lbs. cottonseed meal.

Feed your Jerseys one pound of grain mixture for approximately three pounds of milk.

Strong Milk

I would like some information about a heifer which freshened her first time November, 1928. She was bred the second time and is dry to freshen in two months. The heifer gives about three quarts of milk a day, but the milk is strong.

THE strong milk produced by your cow is not uncommon in this season of the year when the cow has been fresh for a long period of time and is being fed on dry feeds. The cow has now been milking over a year and since you have no succulent feeds, as roots or silage, such a condition of the milk would not be unexpected.

This trouble is caused by an enzyme known as lipase which is responsible for a decomposition of the fat resulting in rancid odor. Reducing the grain ration and giving the cow two or three doses of Epsom salts at intervals of three days might result in removing the cause. The only certain method of preventing the development of the rancid condition in milk is to heat the milk to the boiling point promptly after milking and cool as rapidly as convenient to a low temperature.

... It's easy to produce
CLEAN MILK with

The DE LAVAL MAGNETIC MILKER and ALPHA DAIRY POWER PLANT

WITH a De Laval Magnetic Milker and an Alpha Dairy Power Plant it's EASY to produce clean milk. The milker prevents barn air or dirty hands from coming into contact with the milk, and the Alpha Dairy Power Plant, while providing economical power for operating the milker, also heats 4½ gallons of water, by circulating it through the engine cylinder jacket, for washing purposes—at no extra cost. This hot water is available immediately after milking, right where it is wanted.

By sucking first cold and then hot water through each unit after each milking, the De Laval can be kept sweet and clean at all times. A De Laval Milker can be cleaned effectively in just a few minutes. All parts which come in contact with milk are easily accessible for brushing when desired.

No milker can produce cleaner milk than a De Laval, and no milker can approach a De Laval Magnetic in perfection of milking, ease of operation and reliability. See your De Laval Agent or write for full information.

Fig 1

Barn Roof Design

By R. U. BLASINGAME

BETWEEN 800 and 1,000 barns are lost by fire in Pennsylvania every year. This information comes from the Fire Marshal's office at Harrisburg. I attended a conference held at Washington, D. C., November 14-15 last, devoted to "Spontaneous Heating and Ignition." Mr. Eaton, fire marshal of the province of Ontario, Canada, was there and he reports about the same number of barns destroyed by fire in his province as we suffer in Pennsylvania. Mr. Eaton is of the opinion that spontaneous ignition is responsible for a great many of these fires.

The Gothic Roof

Whether these fires are caused by spontaneous origin or not they are a great economic loss to Pennsylvania agriculture. And the barns must be replaced at considerable expense, possibly in the aggregate between five and six million dollars, to say nothing of the loss of hay, grain, livestock, machinery, etc.

The Gothic roof is coming into more frequent use, from all indications. The rafters are sometimes made of short lengths of 1 inch by 3 inch material three to four ply. The shorter the lengths the more pieces required to build up the rafters. However, less material is cut away in the short as compared to the long pieces. One of the well-known barn equipment manufacturers, who supplies plans at a very reasonable cost, recommends the use of two pieces of 1 inch by 8-inch material sawed or cut to shape, and a 1-inch by 4-inch piece on each side, placed so that no cutting is necessary. The rafters are placed 32 inches apart.

The usual method of laying out the Gothic roof is on a floor and arrange a form in which to build the rafters. Take three-fourths the width of the building, outside measure, and draw a line 3 to 4 feet below the line at the top of the plate. By reference to Fig. 1 "A" and "B" form the centers of part circles, which is the shape of the rafters. The arcs of the circle should be

drawn either with a piece of wire or two planks spliced together. A building cord will stretch too much for accurate work.

When the rafters are complete they may be lifted into place by a "gin" pole. After they are toe nailed onto the plate it is common practice to secure them to the studs by 2-inch by 6-inch pieces tied in by a stiff leg as shown at the right in Fig. 1. The collar brace near the "peak" of the roof gives strength and an anchor for the hay track. The eaves or lookouts are often formed by short pieces of 2-inch by 6-inch cut to a 5-foot radius to make an easy curve with the roof. The Gothic roof is well adapted to barn widths up to 40 feet. The radii of these rafters is 27 feet; three-fourths of 36 feet, which is the width used in this case, as shown in Fig. 1.

The Gambrel Roof

This roof is usually laid out by drawing a semi-circle (half circle) with half the width of the barn as a radius as shown in Fig. 2. The rafters are laid out on a floor and a form constructed in which they are built.

After the half circle is drawn (using a wire or plank which will not stretch) place the lower rafters so that they are full pitch or 60 degrees with the horizontal. The upper end should fall within the circle. In Fig. 2 a 14-foot piece, 2 inches by 6 inches, is employed. The upper rafter in this 36-foot barn is also 14 feet long and placed at 30 degrees with the horizontal. The peak of the roof should be slightly above the one-half circle.

The "lookout" at the left of Fig. 2 is usually placed 45 degrees with the face of the stud.

A collar brace at the top of the rafter and braces at the break in the roof, and another brace from the lower rafter to the studs, shown in Fig. 2, make this roof very strong. These roofs are usually sheathed solid with shiplap, before the covering is put on.

Fig 2

FARQUHAR NEW INTERCHANGEABLE GRAIN DRILLS

Here is the most completely satisfactory Drill combination. Sows accurately all kinds of grain with wide range in quantity; grass seeder; fertilizer sown according to the latest approved method. Well balanced, light draft and easily operated.

But the Big Outstanding feature is the simple method of changing the Hoe drill to a Disc Drill—and this change can easily be made in 20 minutes. Ask for Big Bulletin No. 330.

An Outside Chimney

Would like to receive some information on how to build a chimney on a frame house (on the outside). How is it fastened to building and is flue tile necessary? We intend to use new brick. Thanking you. J. W. Smith.

CHIMNEYS built on the outside of the house never work as well as those built inside, so we are told by the manufacturers of house heating equipment, and also by architects. However, they are used a good deal. It is rather expensive to tear out sufficient space in a house to put in a chimney. And the appearance of a house is frequently enhanced by the lines of an outside chimney.

The reason outside chimneys are not as good as inside is due to the fact that they are exposed to cold weather and do not hold the heat as well as the inside chimneys. For this reason they do not have quite the draft of the inside flue. Sometimes outside flues are built 13 inches thick, that is the thickness is made up by the length of a brick or two layers of brick laid side by side. This is, of course, more expensive than when they are built one brick thick. The double thickness, however, seems to retain the heat better than the thin wall.

The chimney, I think, should by all means have a lining and can be attached to the house by bolts. The bolts can be made out of 1/2 or 3/4 inch round iron fastened into the wall of the house, preferably to the studding. The chimney should extend above the highest portion of the roof to prevent down drafts. R. U. B.

Five Year Old Battery

SEVERAL subscribers have written about putting acid or fresh electrolyte in farm lighting batteries four or five years old and which have a good deal of sediment and will not hold a charge very long.

Such batteries have about reached the limit of their useful life, as farm light batteries are ordinarily taken care of, and it is usually a waste of time and money to clean them out and put in fresh electrolyte unless they are overhauled and put in good shape otherwise.

If the battery has had good care, often several years more service may be secured by putting in new positive plates, new separators and new electrolyte. Many times the negative plates also may be in bad shape and new batteries may be the only solution.

The owner should have the batteries examined and tested by a competent battery man before doing any overhauling, otherwise it may all be wasted. I. W. D.

Excessive B-Battery Consumption

WE frequently hear about radio sets requiring excessive B-battery consumption, some of which are evidently due to excessive use of the radio.

A good heavy duty B-battery can be expected to last a five-tube set about three months, where the set is used from two to three hours per day. If the set has more tubes or is used more hours per day, the life of the B-battery will be correspondingly shortened.

Some of the most likely causes of excessive B-battery consumption are: Chatter absent or run down; too large a loud speaker or too close an adjustment of the working parts; weakened tubes, requiring them to be forced for volume; a power tube too large for the B-battery used; leakage in the B-battery circuit.

If sure you have excessive consumption, better have a service man check over the set. I. W. D.

SAVED from the stock-yards

THIS old cow is 14. She's been an extra good one in her day, but her milk record in her twelfth year clearly indicated that she was falling off. For she produced only 5415 pounds of milk, or \$69.53 profit above her keep.

The first months of the next year indicated that she was still slipping... that she was on the down grade... headed for the yards. Then, as an experiment, Dr. Hess Improved Stock Tonic was added to her ration. She picked up enough to produce 5592 pounds of milk, earning \$75.72 above the cost of her feed.

But the next year (her 14th), with Dr. Hess Improved Stock Tonic in her ration regularly, she produced 7971 pounds of milk* ... \$158.98 above her feed cost.

An old cow reclaimed! And the part that Dr. Hess Stock Tonic played in this particular case is only indicative of its value in young herds.

With all the necessary minerals, with its conditioning qualities to promote good health, Dr. Hess Improved Stock Tonic makes its big showing on the record sheets of cows in their prime.

Two cents per cow per day will add Dr. Hess Improved Stock Tonic to your dairy ration... dollars to your monthly milk check. See your local Dr. Hess dealer and get at least a 90-day supply to begin with. Figure 18 pounds for each cow.

DR. HESS & CLARK, INCORPORATED
Ashland, Ohio

Dr. Hess Improved Stock Tonic

A Conditioner and Mineral Supplement

*All milk sold as Grade "A" at \$3.50 per cwt.

HOW MUCH SUCTION IS REQUIRED TO MILK A COW?

NO two cows on your farm milk exactly alike. Some are fast milkers. Some milk slowly. Considering this fact should all your cows be milked with same amount of suction?

Judge from the sucking action of the baby calf. He varies the strength and speed of his suction according to the quantity and rapidity of the milk flow from the cow.

If a cow milks hard, the Perfection Automatic meets the situation by applying more suction—in shorter sucks. If she is an easy milker, the suction applied by the Perfection Automatic is reduced, but the sucks are longer. This automatic adjustment, which is governed by the milk flow of the cow, is an exclusive Perfection feature.

PERFECTION MANUFACTURING COMPANY
2170 East Hennepin Ave. Minneapolis, Minn.

Jim Brown's Super Quality Baby Chicks

Make More Money for Poultry Raisers

Broilers in 8 Weeks! Layers in 4 to 5 Months!

Every day letters come pouring into my office from customers telling of the splendid results they have had with Jim Brown's Super Quality Baby Chicks purchased from me last year. They all speak of the wonderful vitality of my chicks and marvel at how quickly they developed into profitable broilers and early layers. 1½ to 2 lb. broilers at 8 weeks and pullets laying at 4 to 5 months of age are common occurrences.

Stock and quality tells every time and when you buy Jim Brown's Super Quality Chicks you get chicks from stock of rigidly culled flocks where only one breed is raised and where many of the roosters used for breeding purposes come from trapnested hens with egg records of 200 eggs per year and up.

Here's Proof of Super Quality

"The 500 R. I. Single Comb birds sent me last March are the longest birds I have ever seen. They are a very beautiful dark red and fat. A poultry expert from Massachusetts Agricultural College declared them the finest birds in this section of state. These birds started laying August 10th. They started off with a bang and never stopped—within 2 weeks were laying 100%—at this writing 75%." — Mrs. Carrie G. White, East Tanton, Mass.

"In April, 1929, I received from you, 100 English Leghorns, 88 Barred Rocks. There were eighty-four pullets in all. The first of these laid when I received 601 eggs, in October 1929; in November 1215 and in December 1012." — William Lumbe, Methuen, Mass.

"Last March and April I bought 400 Special mating heavy laying strain R. I. Reds from a hatchery in..... May 3rd I bought 200 Jim Brown's Barred Rocks intending to sell most of them for broilers but kept some and today your birds are outlaying any I've got. They are laying about 60% (Jan. 15th) which is certainly fine." — Mrs. Leroy Brown, Peekskill, N. Y.

Notes I have hundreds of letters like these.—Jim Brown

Farm Facts and Fancies

By ALVA AGEE

CALIFORNIA alone produced over nine thousand acres of carrots last year, receiving nearly three millions of dollars for the crop. The burden of consuming all these carrots would not be serious if every person ate his share and did not leave an undue portion upon those who try to do their duty in the matter. Somebody is shirking.

Setting a Price Too High

In the interest of clear thinking I should like to know what is meant by fixing a price for a farm product that will increase the producers' immediate net income without stimulating production.

We are told that if the present effort to control prices succeeds it is important that the farmers do not demand a price level that will induce added production and the creation of a surplus that will undermine the situation. For years we have been facing the fact that a low level of prices was attended by overproduction. Any prospect of better prices leads to expansion of plans for production. The great copper interests are restricting production so that the price per pound may be held around 18 cents. The oil interests are less successful in control, but they are trying to find means of limiting supply.

Any price for a farm product that is lower than the present one certainly is not wanted, and one that is higher necessarily spurs production until means of control are found. Are we not trying out a car without any brakes?

Large-Scale Farming

Dr. Frank App, who is in charge of fruit and vegetable production on a very large scale in southern New Jersey, writes that in his experience "large scale operation is enjoying very many advantages not obtainable by small producers." He has found this to be true in the case of tree fruits, but had been in doubt about vegetables until last year. He says: "A production of vegetables can be so arranged as to furnish far superior control features so that they can be planted, cultivated, watered and insects controlled at the proper time so as to obtain better than average production at less than average cost."

Dr. App and Mr. Henry Jeffers of the Walker-Gordon Company have wondered at my long-standing doubt of any true economic drift in this country from ordinary farming into big corporation farming. They assume that plenty of others could show as much skill in management as they show.

Sometimes I think that the wonderful advance in application of power to food production may bring more extension of corporation farming than I had foreseen, but the fact remains that most farming land is owned by people who want to boss their own efforts in life, and they will put up with what they make, be that much or little, and their products will continue to fill the markets regardless of any showing of balance sheets.

I like the winning that my friends are making in corporation farming, but especially like the grip on the land that the relatively small farmer has, and I think he will keep it.

Group Political Action

A Washington county, Pa., subscriber, feeling the unfairness of taxing methods and the burden of freight charges, writes: "If the farmers would be willing to get together and drop politics, put up a good man on a people's ticket, or some ticket outside of the two major parties, it may be we could get somewhere." He wonders whether all the land owners of the state might be brought to com-

bine and finance a movement to influence elections and legislation on behalf of agriculture.

I do not like to say disagreeing things, but such plans do not go out. Farmers would not do the bining or the financing, if judged by past experiences. Our friend must realize that there are too badly outnumbered state to let group action be effective. If we could stretch our imagination sufficiently to see them act as one group, they would be before they started.

No, we are committed in the try to party control, and the effective way of influencing within these parties. This is definite one, and the headway any group of citizens has its interest has been through ent pressure upon the leaders dominant parties.

Eastern Farmers' Competition

Our friend would have the movement reduce railway freight to everything pertaining to agriculture to two-thirds of the present and believes that would benefit farmers. Now, the fact is the eastern farmers' chief protection is the cost to the western of getting his products into natural markets of the easterner. Land is less fertile in the states, and cost of tillage is higher and it is only remoteness from markets that keeps the western making conditions harder for eastern man.

Crowd the fruit districts Northwest, the potato districts Idaho and the upper Mississippi valley, the poultry and dairy sections all that region, along with the rest of the South, up against eastern markets and there is trouble enough for the easterner. Distance is the only barrier roads have increased their charges and thereby brought the West east.

As to Rates

Now, let us understand what I know nothing in particular the fairness of freight rates. I am glad enough the government closes a good deal more night of rates than railroads like. My guess that increasing efficiency of transportation will tend all to lower rates, but I do not see the closer the West is to eastern markets by lessening putting its products into the consumers, the tighter market becomes for the eastern producer.

If the railroads make a turn on the investment, but a right to a reduction, but it is something demanded by eastern agriculture. The bringing the fertile land of the hillsides of the eastern states to the hillsides of the West.

My own reckoning would the freight rates on the products from eastern farms to eastern markets are too high in comparison to the rates paid for long hauls in this country, and right here we may be most needed.

The Same Line

I AM more than thankful to D. Zinn for his good writing, especially Chapter 3 of the "Farm Story." I hope that this good. All superintendents, teachers and patrons ought to put up and put this method to or at least a good part of the payers may be getting a portion of our money back.

I came up along the same line as Mr. Zinn almost. W. Va.

For farm work *this* Spring...

for economical service through *many* seasons

THE FORDSON AGRICULTURAL TRACTOR

THE FORDSON—whose reputation is established—is now available through a local dealer... available embodying the following distinctively modern tractor features.

An engine that develops 30 horse-power at one thousand revolutions per minute. High-tension magneto with enclosed starter coupling to insure easy starting. Hot-spot manifold and carburetor for gasoline. Cooling system with water pump driven by a V-type fan belt. An air washer that holds 17 quarts of water.

Other features include a filter to separate grit and carbon from the oil in the lubrication system. Transmission fitted with large roller bearings. Large gear has double bearing mounting.

Sixteen-plate, multiple-disc transmission brake with increased plate surface. Rear-wheel bearing lubricated automatically. Gears that shift easily from increased release movement.

Coil-type front spring. Heavier rear-wheel fenders and platform. Heavy, sheet-metal steering wheel. Heavier, stronger, one-piece front wheels. Still other features optional at extra cost are: a fly-ball governor, pulley, lighting system powered by a generator driven from the fan belt, extra long cleats for rear wheels, and extension rims.

All these features together with reliability, economy and long life. A local dealer will demonstrate its farm advantages to you.

FORD MOTOR COMPANY

Make Cletrac Your PARTNER

PARTNER! That word well describes Cletrac's scope of service on the farm. Powerful, dependable, Cletrac is ready always to shoulder the heaviest jobs on your farm and get them done on time.

Straight through the year—on every operation from plowing to harvesting—a Cletrac Crawler Tractor will bring to your work a new speed and a new efficiency unmatched by any other type of tractor. Its full delivery of rated horse power at the draw bar means abundant power for your toughest jobs. Broad crawler tracks assure positive traction over soft soil and up steep grades. Exceptional economy in fuel and oil consumption sets an entirely new standard for low operating costs.

Find Out About Cletrac for Your Farm

You can profit—as thousands of other farmers have profited—from a partnership with Cletrac. Get the facts about these better tractors today. New folders—just off the press—will be mailed on request.

Cletrac Crawler Tractors are built in a complete line of models from 12 h. p. to 100 h. p. and priced as low as \$1095 F. O. B. factory.

End SMUT Losses on Your Oats Crop with Ceresan

Dust Treatment
Harmless to Seed
Improves Quality
Increases Yields

Smut inflicts tremendous losses on oats yields each year. Recent field counts show that damage to a fifth of the crop is not unusual. Losses are frequently even more severe. In 1928, Iowa farmers lost 18,000,000 bushels of oats because of smut. In 1929, according to state and federal authorities, oats smut caused more than normal damage in Kansas, Iowa, Minnesota, Missouri and Wisconsin.

Seed oats are generally subject to smut. Even the best seed can be contaminated by smut spores from bins or sacks. But you can control smut and end yield losses by taking one precaution before you plant. Treat your seed oats the safe, effective way with Du Bay Ceresan.

Ceresan Harmless to Germination

When liquid formaldehyde treatment is used for seed oats, considerably more seed per acre usually must be sown because of injury to germination. In addition, other injury may occur by freezing, heating or sprouting. The new Ceresan dust treatment puts an end to such risks. It is deadly to both loose and covered smut spores, but harmless to seed oats.

Excellent Control of Smut

In Wisconsin, Ceresan has given very good control of oats smuts as reported by Circular 133. According to the *Plant Disease Reporter* for August 1929, dust treatment with Ceresan gave "good control" of oats smut in Iowa; and in Kansas, Ceresan dust treatments gave "excellent control" of oats smuts.

AT YOUR SERVICE is the attitude of every advertiser in this paper. Write them about your needs. Mention Pennsylvania Farmer.

By R. P. KESTER

INTEREST in the use of mulching paper is developing slowly. My request for the experience of users brought several responses, most of which told of success and profit. On the other side, I have a letter from one who signs himself "Brother C—," a farmer at a monastery, who did not find it profitable. There is one fact in his report which may explain why he did not have as good results as others, and that is he used overhead irrigation. Without question, one of the chief values of mulch paper is its power to hold moisture in the soil. If sufficient moisture is added by irrigation this aid of the paper is negated. His letter, in part, follows:

"Last year I was a gardener in Maryland. I tried out three rolls of mulching paper, two 18-inch rolls and one 36-inch roll. I used it on beets, radishes, lettuce, carrots and cauliflower. Also on cabbage and tomatoes. I pegged it down at first with wire staples, but a storm soon came and the paper flew around like ribbons. Then I drew furrows with a hand cultivator, put the edges of the paper in them and pulled the dirt back on it. After that I had no trouble with the paper blowing off. I always planted test rows along side of mulch paper to see the difference. The whole was irrigated by an overhead system. In no case could I see any difference. Long before the crops were all harvested the paper was badly rotted. I agree with you that the whole question must be decided on whether or not the returns from mulching will show a profit."—B. C.

I want to explain and apologize to some of my friends who, instead of receiving a personal letter, receive a printed reply. While I regret this, it seems necessary in some lines of inquiry because of the great number of inquiries on the same subjects.

Here is part of another letter that has a very interesting tone: After asking some personal advice she continues:

"We, (Sonny Boy, aged 16, and myself) are in the market garden business and do not want to risk any money on an uncertain enterprise. In addition to a garden tractor, we have been thinking also that a garden seedling drill with a fertilizer attachment would be a good thing. Would you endorse this kind of an implement? If so, where can one be purchased? We have seven acres of land, and till about four.

"We find ready market for peas, early potatoes, beans, Lima beans, corn, carrots and everything but cabbage. We can sell a limited amount of cabbage, and we have good soil for it, but where to get a market for it, I stumps us. The Pennsylvania Farmer states that more cabbage is shipped into the state than is grown here. Why, then, can we not sell it? We could raise only an acre, although there are 20 acres we could purchase if we want it, and we would if we could sell the produce.

"Another thing that puzzles us is plants. To buy them costs so much at present. We are considering a small greenhouse, and hope to get it going by another year. We will have no trouble in selling all the plants we can raise.

"Sonny Boy would like to have a large farm, with tractor and all modern equipment, and I hope we can have it some day if the present slump passes. By careful management we can make a nice sum of money here."—Mrs. E. B. Chester county.

I can imagine the helpful sympathy of this mother as she plans work of this little farm with her son. And I can see the feeling of partnership that exists in Sonny Boy's heart as he discusses plans and prospects with her. This is as it should be. I am sure that many families would have been kept intact if parents had made confidants and partners of their sons and daughters.

There is a good market for cabbage in most industrial towns, or at least that used to be the case. I am well aware that the eating habits of all classes have changed greatly in the last 10 years. Even the laboring classes are inclined to more the cheapest and most filling foods, things they used to buy largely in the interest of economy.

This mother and son are wise planning to hold on to and make the best of their present farm for the time being. The possibilities of a few acres are almost limitless. I doubt it is advisable to hunt for a garden seed planter having a fertilizer distributor. The distribution of fertilizer for narrow row crops should be the broadcast method and it should be thoroughly worked into the soil before the seed is planted. This may be done by sowing by hand, or the use of one of the several distributors of the wheelbarrow type.

Friendly Talks

By Edgar L. Vincent

NOTHING helps a man to do a high more than to feel that he is doing something for somebody else. The world expects something of every man who is born into it.

"What! Expects something of me? My farm is a hill place, away from the main roads. A good part of the year we are shut in by snow drifts and bad roads. What can I do for the world? It is all I can do to take care of myself."

And yet, it is true that the world has claims on every last hill-farmer, every farmer everywhere; and nothing takes the hope and the glow out of a man faster than to get the idea that nothing is expected of him. We are not doing ourselves justice either, when we take this view of life. Anything that makes a man think less of himself than he ought to think in just that degree paralyzes his efforts to be a good farmer.

True, it may not be much we can do over and above the average, but we can do something. I know a back-country farmer that greatly increased his crop of corn, just by picking out the ears that grew two on a stalk and using them for seed. In a few years he had a strain of corn that had many stalks with two ears on them. Say anything to that about this and he will tell you that "it is nothing. All in the day's work."

And yet it is something. By increasing his corn crop he did the world a good turn. His neighbors wanted some of his corn for seed, so the good work spread and nobody knows just where such a thing will end.

Every good crop we grow, every stump we pull, every good furrow we turn, every kind thought we have, every good word we speak by just so much helps to make the world better, and hill farms and back roads have nothing to do with it.

Spring Hill Puts Ill-Fortune to Work

By W. R. GORDON

was nearing midnight as the last group struggled with a sputtering car and finally got under way across the hills toward home. Every one had so much fun that night. This was the first of the annual "warm-sugar" social. What big spoonfuls of creamy maple sugar, cakes and coffee, who would ask for more? The youngsters had demonstrated the making of "snow" by pouring hot sirup in a thin stream back forth over plates of snow. If there is anything to the theory that sugar is an energy-producing food enough energy was stored up that night for a long time. It was going to be needed. There had been games and music and a few of the best had cut some of their original capers.

It was the mood of the night. Could some one have looked ahead six hours and seen what would have been no more than a hill of mirth. How ill-fortune is ushered in by laughter.

The last family group to have reached the foot of the hill and were entering the lane that leads to the house when one of the boys exclaimed, "Oh, look!" A ominous red glow was coming up into the sky. It did mean but one thing.

From there, it might be said, the school, the church, the Grange hall. Although the school could be seen, they hurried back.

In an ably short time almost every one in the neighborhood stood about the burning heap of timbers. It had been their Grange hall. The flames died down some hopes died too. Things had been planned for that year; arrangements to be made in the hall itself. A new roof had been stored in the basement. A new electric light plant had just been installed. The date had been set for a community gathering when some playground equipment was to have been built on the school grounds.

Disraeli who said? "I never admit failure. It's whether he did or didn't, it's a helpful philosophy. Though hard to accept at the time, we can all recall some act of misfortune, adversity that stirred us to greater effort, to sacrifice than we ever thought we were capable of. Spring Hill had met ill-fortune before. They were plucky then. They would be equal to this. This was the spirit that prevailed at a time called to consider what might be done.

A woman took the lead. She declared there would be another hall, a bigger and finer one than the one that had been destroyed. Her words did one over could have been. Her words did one that needed spark of enthusiasm. One another echoed her confidence. It was agreed. They would build another hall. Right away! The plan once started gained momentum faster than the most optimistic had hoped.

They had the pleasure of witnessing the laying of the cornerstone of the new hall on the following Fourth of July, just a little over two months after the fire. They opened their new building for a reception on the 22nd of October. In less than a year Spring Hill had a new community building and born with it a new spirit and a new enthusiasm.

This day of bland materialism, a day of over-emphasis on the importance of things and activities, we are frequently confronted with the bald

fact that there are differences in rural life that can't be explained by differences in type of soil, variation in type of agriculture or disparity in net farm incomes. It isn't all physical after all. It isn't all economic. The explanation will often be found in the differences in the people themselves.

A rather prominent man, who should have known the facts, once hurled this question at me in a meeting: "Isn't it true after all that if farmers concern themselves with making a bigger income all these other things in country life will come as a matter of course?" My reply was, and is, "No! Emphatically no!" And there is a wealth

The Spring Hill Grange Community Hall.

Plan of the Building

of illustration to prove that the point of view so expressed is not valid. Some things, some satisfaction will come easier with an increased income. Others may be had without it. Many in country life will have to come without it.

This little community in Bradford county, Pa., is one illustration of what people can and will do, will work for, will determine to have when they possess a sound appreciation of value, even though their income remains the same. Woven into the community's fabric is some fine Yankee stock. There are farms that have been in the same family name for three generations. There are newcomers who have married into these old families and who too have brought their traditions and worthy ideals. Many of those who have gone to live other places retain a loyalty to the home of their childhood.

hood. This is witnessed in the record of contributions to erect this new building. "Folks is funny that way. Some is and some jest aint," an old Negro woman down home used to say. But let's get back to our knittin'.

The building is a one-story structure. In this respect it is ideal for a community hall. Any kind of entertainment may be put on and there is little hazard in case of fire. Plenty of exits right out onto the ground level. The construction is frame with a stucco finish. The dimensions over all are 52 by 60 feet. You will notice by the accompanying sketch how compact it is, how well planned for the many uses of the community.

The auditorium is nicely proportioned and provides a large platform at one end. Note the depth of the platform, 15 feet 4 inches. You can put on an entertainment on a platform like that. And it is high enough, 26 inches. The kitchen is handy for property and dressing room during the performance. The partition between the kitchen and dining room is built with a large opening and counter so all servings are passed out over it. This saves time, confusion and labor whether the service is at tables or cafeteria style.

Then the partition between the auditorium and the dining room is a good feature. It consists of folding doors. When pushed back considerable space for seating becomes available in the dining room.

The youngsters make good use of their room. Here they have programs while the grown-ups attend their own meetings. On Sabbath it is used for one of the several Sunday school classes that meet there. In case a small group, a committee, wishes to meet at the hall this room can be quickly and economically freed.

That arrangement of a front hall is good too. You have access to the auditorium, juvenile room and ante-room. All rooms have double-door exits to the outdoors. The auditorium has three. All outside doors are fitted with panic bolts. Here is a building worth \$12,000 erected with an outlay of a little less than \$7,500, including the furnishing.

Does the community use it? Judge for your self. Some of the folks got curious the other evening and counted up 214 occasions during the past year when some group had used it. Here's something else that is an index to the spirit in Spring Hill. They had a key to the front door when the building was completed, but they don't know where it is now. The building has not been locked since it was dedicated. Any group may go in and hold a meeting. The rule of the western woods prevails: "Leave your camp clean and firewood for the next traveler."

The building was located so it might be a true community center. The school is within a hundred yards. The church joins it on the other side. They use it on Sabbath for Sunday School. Eight classes meet there. Incidentally the attendance has doubled and Spring Hill now has the largest rural Sunday school in the county. There is a Men's Fellowship Society with thirty members that meets once a month. The Ladies' Aid and Missionary Society use it. The school comes there for its social gatherings and entertainments. A local Boy Scout troop also meets there. This structure erected by the community, owned by the community, sup— (Continued on page 42.)

MOVING TIME

WITHIN a few weeks many subscribers will change their place of residence. We will appreciate it if they will notify us promptly, being sure to give the old address as well as the new. For it is impossible to make the necessary changes in our mailing list without knowing both addresses.

SHEEP AND WOOL GROWERS

THIS year it is West Virginia's turn to hold the annual meeting of the Tri-State Sheep and Wool Growers' Association. The meeting will be held at Moundsville, March 20-21, and with it the usual exhibits of wool and its products. This old organization has done a lot of good work in the past and appears to be as vigorous as ever.

ANOTHER MURDER

THE Drovers' Journal of Chicago states that Carl Brunne, a farm worker of Washington county, Ill., died in the hospital last week of injuries inflicted by a bull. We have no particulars in this case but venture to guess that the killer had been considered a gentle animal up to the time of the attack. At least that is true nine times out of ten.

A TAXLESS TOWN

THE Department of Forests and Waters says that the village of Ebern, Germany, collects no taxes and every year gives each household a load of firewood and sixty marks in cash. "This revenue represents the profits of community forests owned by the town and so well managed that they more than pay the community expense." Most of us would be satisfied if something paid the taxes. How would it feel to be a resident of Ebern?

TWO GREAT INVESTMENTS

IN 1900 the Commonwealth of Pennsylvania secured title to its first public forest lands, a little over 77,000 acres. Now the state forest lands amount to 1,200,000 acres of which 1,200,538 acres was purchased at an average price of \$2.37 per acre. The policy of purchase continues and should prevail until the available area of such land is unimportant. This is the best investment the State has ever made, with one exception—its investment in education.

A TRAIN LOAD

OUR special train to Florida and Cuba, February 18-28, is full and no more reservations can be accepted unless somebody is compelled to cancel. This trainload of farm folks was assembled through the information given in this paper, without mail or personal

solicitation. They are all volunteers, and we hope they have an enjoyable as well as a profitable vacation.

ROBERT J. EVANS

OUR old and genial friend Robert J. Evans, for many years Secretary of the American Duroc-Jersey Record Association, Chicago, died suddenly at his desk on Thursday, February 6. He was 65 years of age, and was one of the few swine breed record officials to hold office through the difficult period following the collapse of 1920. He had many friends in this region and deserved them.

FROM LIFE

WHEN wool declined after the Civil War a certain farmer vowed that he would sell no more until he got a certain high figure. The years went by and the market never got up to his price. Finally he died, leaving nearly fifty clips for his executor to sell. A rash vow, involving nobody but the man who makes it, might be "better honored in the breach than in the observance."

WHICH WAY?

AN old friend says, "What you write about changes in business is true, but are such changes for the better? We used to get some money out of horses in this county, but how is it now?" Probably this change is for the better when all things are considered. At least the point is debatable. It is still possible to get some money out of heavy horses in that county but not out of the kind mainly raised there years ago. Most of the time since the horse business went down a two-year-old steer, a young cow or the equivalent of either in ewes would have brought in as much cash as the horse of other days did at the same age. And this probably with no greater investment of cash, labor or skill and no greater risk of loss by injury or disease. Hogs are not mentioned because this friend lives in a grazing country. Are we right or wrong about it?

IN WEST VIRGINIA

WEST VIRGINIA'S Farm and Home Week, at the University at Morgantown February 3-7, brought forth the largest crowd in the history of the event. The annual exhibit of farm products and home crafts were better than last year, and a state flower show and a home cream demonstration were scheduled for the first time. Facilities for the event are inadequate. Larger lecture halls will be needed if the audiences continue to grow, and a livestock pavilion is an absolute necessity, not only for this week but for regular instruction of students. Livestock judging contests and demonstrations had to be held in the mud and in whatever weather nature provided. For the first time West Virginia has Master Farmers, three outstanding farmers being thus honored on the same platform as the Master Homemakers. The College of Agriculture's equipment continues to improve and its service to expand, meriting the growing respect and support of the public.

West Virginia farmers are interested primarily in production and largely in the production of grazing animals, though fruit, poultry and dairying are important industries. Classes in all of these subjects were large. Interest in community improvement, with all that implies, continues to grow. Taxation is a vital issue and the fact that it comes up for discussion in nearly every group of farmers is significant. Cooperation continues to progress, but it is marked by conservatism rather than by rashness. On the whole the agriculture of the state reveals progress, and it is more than merely material progress.

THE CANADIAN POOL

THE Canadian wheat pool is cited as a conspicuous example of success in cooperative grain marketing. We always held that no such organization could be called a commercial success until it withstood the test of time with its conditions, emergencies and adversities. comes Dr. James E. Boyle, economist at the pool, with the assertion that the Canadian pool is not entitled to be called a success should still be classed as an experiment. shows that the pool has not marketed more economically than under the competitive system; that it has failed to stabilize flow of wheat to market; that it has to stabilize the price; that it has failed to advance the price; that it has not carried out orderly marketing but is now engaged in gigantic speculation, holding many millions of bushels of the 1928 and 1929 crops at higher price. He does not attempt to tell how this speculation will end but "The pool, by withholding wheat worth hundreds of millions of dollars, has seriously ranged the whole credit structure of Canada; has brought the country more to a critical position; and has deepened Canadian exchange in the United States at least two per cent. After all the kiting of wheat through the regular commercial channels was more orderly than the present experiment." A few months will show how this speculation will end us watch and learn.

AN UNSTABILIZING ELEMENT

WHEN the Agricultural Marketing was under discussion we claimed the Federal Farm Board could not be a stabilizing agency for the reason that no market can be stabilized by the acts of the Board rather than the words of its members; but the New York Journal of Commerce, in commenting on the "unauthorized loquacity" of Board's cotton representative, says: "Apparently the members of the Farm Board make no attempt to confine their statements to matters on which they all agree or to lines of policies that they expect to carry out. On the contrary the members not only agree among themselves as to what they will do but they contradict one another in their public utterances, thereby creating a confusion of counsel that has made the Farm Board to date just an uninteresting element in a highly unstable pricing situation." If mere word-confusion is an unstabilizing element what may we expect of the

STABILIZATION CORPORATION

IT is no secret that sundry members of the House of Congress have contemplated the Federal Farm Board because it had no stabilizing power for grain and cotton. The pool is ready to deal with such questions at the present time. This meeting was a continuation of the "question box" meeting held at the National Agricultural Week to further discuss power farming, fertilizers, seed, spraying, soil erosion, grading and other things of importance to the potato industry. About 200 growers were present. Power farming brought forth many questions and several growers related their experiences during the past year with the use of tractors in planting, cultivating and harvesting their crop. Two of these growers, with 2000-acre farms, mounted on a platform and reported that the results obtained with the new methods were very satisfactory. A discussion of spraying led by Doctor Martin was interesting to note the large amount of potato growers in the state who had not sprayed during the past years. Extensive data as well as experiences of other growers brought out rather definitely that increased yields in New Jersey due to systematic spraying average about 60 bushels per acre. In answer to a question of the spray pressure necessary to obtain satisfactory results, Doctor Martin said that a series of tests on the farm of Alfred Sloan, a pressure of 250 pounds gave as satisfactory results as higher pressures.

New Jersey Farm Comment

By G. W. HARRIS

The growers favored the potato grading agreement which was in effect during the past year through the efforts of the Farm Bureau Federation, growers and dealers, and asked that it be changed in certain sections, to be more effective. A new agreement has been drawn up and as yet has not been signed. This agreement was presented to the growers by H. E. Taylor, secretary of the Federation of County Boards of Agriculture, for their reaction and will be presented to other groups at later meetings.

The meeting adjourned, not because all questions had been answered, but because of a lack of time for further discussion.

A REPORT of the dairy extension department at the College of Agriculture shows the amount of milk required to pay the board of cows.

The following is quoted in showing the relation between production and the quantity of milk required to pay a cow's feed bill.

"Does the milk consumer realize that of the 2,697 quarts of milk coming from our cow of average production, 1,400 quarts must be used to pay the cow's feed expenses? Do the majority of producers fully appreciate the big handicap under which the cow of 5,800 pounds capacity or less is working? From the 40-quart can that is filled by 5,800-pound cows the owner must take out the returns of 20.7 quarts to pay for the feed required to make that can of milk. From the 40-quart can that is filled by the 12,000-pound cows the owner needs to take out 13.3 quarts for feed costs."

ORA BUSSARD a Washington county, Maryland, 4-H Club girl, was recently awarded the 1929 scholarship offered by the Baltimore and Ohio Railroad for outstanding club work in that state during 1929.

Her scholarship and leaving have been the first of the 4-H Club girls in Maryland. For her scholarship she has made the greatest part of her time during the last season spent at and as a representative of the Washington County Federation, has trained demonstration teams, has been a winner in judging contests, has been a Maryland delegate to Camp Vail, and is one of the two girls who edit her county 4-H Club News Bulletin.

Two scholarships are made available by the railroad each year for 4-H Club members living in counties traversed by the company's lines, who have made outstanding accomplishments. The other scholarship has not yet been announced.

THE 4-H Club boys from New Jersey who entered the national 4-H Club poultry judging contest at the Madison Square Garden Poultry Show in New York City on January 18 returned with their share of honors.

James Pettit, R. Lawther, William Eppert and Walter Girilin made up the team. Seven other teams were entered from Delaware, Massachusetts, Pennsylvania, New York, Maryland, Connecticut and Virginia.

The New Jersey boys placed first in judging exhibition classes and White Wyandottes. James Pettit won the silver cup given by the Maryland Poultry Association for the highest scoring individual outside the New England states and the medal given by the American Poultry Association for second high individual in judging exhibition classes.

The Delaware team, made up of Frank A. Elliott, Medford Hatfield and Marvin W. Klair, was nosed out of first place and the sweepstakes cup by the Massachusetts boys. They carried home the silver cup given by the Virginia Poultry Association for the high team outside the New England states. Marvin W. Klair placed third for individual honors in judging exhibition classes.

BELIEVING that a person is never too old to learn, Cape May county farmers have been holding at the Court House a series of evening lecture courses pertaining to their farm business. This work is in cooperation with the county extension service and the vocational schools.

A one-week's course in tractor repairs was held at a local garage and taught by Donald Balliet of Ohio. Those taking this course brought their tractors and spray machines to the workshop where they were completely overhauled.

Each evening one week, H. F. Thompson, proprietor of Thompson's Gardens, Seeking, Mass., lectured on practical matters relating to vegetable growing and marketing. On each Friday evening, January 24 to February 28, the poultrymen are meeting, while Thursday evenings, February 7 to March 13, are devoted to dairy problems.

NEW JERSEY'S potato growing champion is Carl S. Race, who, as farm superintendent of the State Home at Vineland, obtained an average yield of 461 bushels an acre, a new high record, on a three-acre plot in the 1929 state potato growing contest. Mr. Race was awarded a gold medal during Agricultural Week at Trenton and as the winner of the contest he will be known as New Jersey's "Chief Spud."

The previous high record in this annual competition of potato farmers, 434 bushels, was established in 1928 by Russell Thomas and Theodore K. Bennett, partners in a farming enterprise at Belvidere.

These two men were runners-up in this year's competition with an average yield of 332 bushels. Others whose yields amounted to 300 bushels or more to the acre are Edward H. Mackey, Belvidere, 316.7 bushels; William Smick, Salem, 312.8 bushels; Harry Featherer, Salem, 309.2 bushels; Joseph Fly, Hightstown, 307.5 bushels; Alfred Sloan, Elmer, 304.1 bushels; and Linwood Patrick, Elmer, 300.2 bushels.

All of these growers were awarded gold medals by the potato association in recognition of their high yields, and on each of them was conferred the title, "Big Spud," for the present year.

CANNERS and growers of canning crops from all sections of Maryland are expected to attend the annual Canning Crops School to be held at the University of Maryland, P. O. Box 18, on February 18 to 20.

According to E. W. G. the principal speaker at the school will be Dr. J. H. G. of the University of Maryland, who will discuss the importance of canning crops in the state and the methods of growing and marketing them. Dr. G. will also discuss the importance of canning crops in the state and the methods of growing and marketing them. Dr. G. will also discuss the importance of canning crops in the state and the methods of growing and marketing them.

The meetings will open Tuesday morning with an address of welcome by Dr. T. B. Symons, director of the University Extension Service. Following Dr. Symons, individuals from the University and State will talk on the problems of grower and canner.

A Profitable Winter Pastime

By C. A. MAY

LACK of plans at the beginning of the planting season has meant a loss to many home gardeners each year because of more or less haphazard distribution of their crops. "A garden well planned is half planted."

If the gardener will first measure the proposed site and then plan to use only as much of it as is needed for vegetable plantings, it will be possible to use the rest of the space for plantings of flowers and shrubs. Garden paths bordered with such plantings, together with the proper use of garden benches, tables, swings, bird fountains, and in some cases a pool, will add greatly to the attractiveness of gardening.

The ease and efficiency of cultivation are much enhanced if all the crops are in long rows, to allow wheel-tool tillage, either by horse or wheel-hoe. The old practice of growing vegetables in beds usually entails more labor and expense than the crop is worth; and it has the effect of driving more than one boy from the farm. These beds always need weeding on Saturdays, holidays, circus days and the Fourth of July.

If land is available for horse-tillage, none of the rows should be less than thirty inches apart. Those which require more space between the rows can be arranged by using a row space double that of the normal row. Vegetables such as tomatoes, cucumbers and muskmelons require the double width of row.

"Experience has shown that there is greater economy of space and that larger yields are obtained when a planting is considered which embraces the following suggestions," states K. C. Westover, assistant professor of the Department of Horticulture, West Virginia University.

"The entire garden area should be made to yield throughout the season. Most of the garden should grow two crops and a part of it three. Cool season crops as lettuce, spinach and radishes, should be followed by warm season crops like beans and tomatoes. These, in turn, may be followed by late crops such as turnips and beets.

"Our common perennial crops as asparagus, rhubarb and horse-radish, should occupy a space at the side or at the end of the garden where their culture will not interfere with that of the general vegetable crops.

"In arranging space for sun-loving plants as beans, tomatoes and peppers, care should be taken that they are not to be shaded by the tall crops such as corn or pole beans. Shading can be decreased by running the rows east and west. Attention should also be given to the crops which are to occupy places which are partly shaded. Although such foliage crops as lettuce and spinach require sun for a part of the day, they do better in places which are partially shaded.

"The garden should be planned with the planting of the long season crops especially in mind. The short season crops can be planted between the rows or between the plants in the row. For example, cabbage and cauliflower are planted as the main crop, with lettuce, radishes or spinach as companion crops.

"Whenever possible grow similar kinds of vegetables in the same part of the garden or have them occupy parts of the same row, since, in general, the same types of crops require much the same cultural treatment.

"If the area is limited do not plant crops which require wide spacing unless they can be trellised or staked. Tall types of peas, beans, tomatoes and cucumbers, if trellised, usually produce more per plant. Such practice will conserve garden space as well as increase the variety of vegetables grown.

"Those crops such as cauliflower, egg plant and peppers which may fall due to adverse weather conditions should be avoided by the home gardener if he has only a small area available. Their places should be taken by crops which are 'certain.'

"A good plan for the home garden calls for as wide a variety of crops as possible, which is consistent with the tastes of the family. The home garden should never be overcropped with a few

kinds of vegetables, but should be so designed as to furnish several kinds throughout the entire year," concluded Professor Westover.

The gardener should map out his job during the long winter months and know when to prepare the seed bed, when to buy seed, what to buy and the amount.

A garden 20 by 100 feet (note table) will supply vegetables for a family of five. Using the same width, a family of ten may have the same number and variety of vegetables by making the garden twice as long as in the latter case. In making the plan, estimate how much of each crop the family can eat in a week. Take radishes for example. Plant only enough of the first planting to take care of this amount. Provide the second week's supply with a second planting.

Such a system assures a constant supply of freshly matured radishes throughout the season. The same plan should be worked out with the other crops in the garden. It is a good plan to make several plantings of such crops as beans, lettuce, beets, peas, radishes and sweet corn.

New Marketing Channels

IT seems to be the idea of some folks that new marketing channels must be made through which farm produce should travel on its way to market. It seems to be a part of this idea that along these channels will be great depots where

Market gardeners have learned the value of carefully planning the layout of their crops. Note the long straight rows and inter-planting.

A field of cabbage with inter-planting of lettuce. Long rows are time-savers on large acreage.

the various commodities can be dammed up and held back during the seasons when farm commodities seem to go on a rush toward the ultimate consumer. The organization for operating the flood gates of these great depots is to be a farmer-owned cooperative that is to have federal aid and supervision.

As one who has had considerable experience in serving on the board of directors of a successful and an unsuccessful cooperative association and who has had ample opportunity to observe the attempts of farmers to cooperate in various ways I do not say that the scheme is impossible, but I do say that the scheme will be compelled to struggle against much opposition from the tide of farm produce as it now flows through the present marketing channels made and kept open by

GARDEN PLAN FOR FAMILY OF FIVE

| | |
|--|--|
| Space between rows, inches | |
| 18 Asparagus, Rhubarb, Artichoke | |
| 30 Peas | |
| 30 Early Potatoes or Peas followed by Celery | |
| 30 Early Cabbage, Cauliflower, Horseradish | |
| 33 Beets, Turnips | |
| 30 Onions (sets) with early Radish sown in row | |
| 30 Bush Beans | |
| 30 Early Corn and Summer Squash or Pumpkin | |
| 30 Late Corn | |
| 30 Lettuce, early and late Radish, Endive, Parsley | |
| 30 Spinach | |
| 48 Tomatoes | |
| 30 Cucumbers, Muskmelon, Watermelon | |
| 30 Potatoes (early) | |
| 30 Potatoes (late) | |
| 30 Potatoes (late) | |
| 30 Carrots (early) | |
| 30 Eggplant, Chard | |
| 30 Green Beans | |
| 30 Peppers | |
| 30 Parsnips, Salsify | |
| 30 Kale, Kohlrabi | |

(Note.—The above vegetables occupy a space of 60.5 feet. The remainder of the area may be used for hotbeds, coldframes, shrubs, berries, strawberries, and other plants which will not interfere with cultivation. The garden is 75 by 100 feet.)

the individual initiative of those who have the ability to make money out of handling what the farmer produces.

If new marketing channels are to be opened from the farm to the ultimate consumer through the cooperative activities of the farmers, no immediate or revolutionary changes in the system of marketing need be looked for, because a cooperative enterprise to succeed must be fostered by those who are cooperative minded, and who know the processes by which this cooperation can be effected.

The greatest obstacle to cooperation among farmers is the farmer himself. The present generation of farmers are very much individualists. They are not yet completely converted to the principle that the good of each is bound up in the good of all. Therefore, any scheme of cooperative marketing that will eventually survive among the eastern farmers must build up slowly through the education of the younger men and women who choose the business of farming as their life work.

Agricultural colleges, extension workers and Grange leaders have a great uncultivated field before them in dispensing knowledge concerning cooperation procedure. The former could well lay off for a season their efforts at stimulating production, and Grange leaders could well lay off from some of the spellbinding speeches on the general subject of fraternity and direct their efforts along the lines of teaching the young farmers the advantages of incorporation for carrying forward any cooperative enterprise.

My experience and observation tells me that more efforts at cooperation go on the rocks because of a failure to keep within the limits of sound corporation procedure and accounting than from another cause.

Insufficient capital is provided and the board of directors ungrounded in the principles of sound corporation procedure. The board of directors fail to require each employee to make a complete report of his stewardship. What one realizes the magnitude of the undertaking and knows something of the obstacles that must be overcome he can see no immediate wide-spread change in the formation of new marketing channels for farm produce.

Necessity is often the forerunner of progress. Hence so long as the farmer can find a satisfactory market for his produce by his own efforts he will not cooperate. On the other hand if the chain store continues to develop as rapidly in the future as it has in recent years it may be the obstacle across the present marketing channels that will provide the necessity for the formation of larger selling units through cooperation. It therefore behooves the younger farmers of today to learn something about sound corporation procedure.

V. R. Nicodemus

U. S. Engineer Looks at Russia

By L. J. FLETCHER

CHARACTER of the country, topography and farming customs of the U. S. S. R. make tractor farming very easy to introduce into most of the agriculture areas of Russia. Fences are practically unknown. The peasants, instead of living on their small farms, live in villages. While the land is farmed in narrow strips in parts of the country, there is nothing to prevent the merging of hundreds of small farms into large farms.

The land is generally level and free from trees and water courses. After one or two years of plowing with large tractors, accompanied by cultivating operations, all traces of the shallow division trenches between the former small farms disappear.

Much of the small grain growing region, particularly that devoted to the use of the Grain Trust, is an area where every precaution must be taken to conserve moisture. This calls for timely operation that is, plowing within a relatively few weeks, planting the entire area within a week or ten days, together with very rapid cultivation of land devoted to summer fallow.

The Russian workers, both young men and women, are quite dependable. While they are more or less completely ignorant of the repair of complicated farm machinery, they make quite good operators.

No wheat growing area in the world is any better adapted for the use of combined harvesters than the steppes of U. S. S. R. The straw is not rank, the fields are level, and in most parts of the country the harvesting season is relatively free from rain.

The peasant system of farming is chiefly characterized by the complete saving of all straw and grain. The small fields are reaped by hand after being harvested by simple types of reapers. Straw is used for thatching roofs, for fuel, and to a limited extent for feed.

When threshing grain, either with steam operated threshing machines or by the crude hand methods, the chaff is always kept separate from the straw and used for feed. Therefore, the recovery of straw and chaff is a problem to be met with the introduction of combines.

The Grain Trust is organized much like an American corporation; there is a Board of Directors responsible to the Chief Governing Committee of the nation. The main office of the Trust is in Moscow.

Farms of various sizes are located in all grain growing regions, but largely in the Ukraine, Caucasus and Volga districts. These farms vary in size from around 20,000 acres to as large as 400,000 acres. Land is being added each year. It is planned that by 1933 over 10,000,000 acres will be farmed by the Grain Trust.

Each farm has a manager and a group of technical assistants and foremen. The work is carried on largely as a series of campaigns: that is, starting in the spring, a plowing campaign, followed by planting and harvesting campaigns. Where summer fallow is practiced there is also carried on a more or less continuous cultivating campaign of the summer fallow.

The workers are composed of young peasant men and women who live in portable camps—each camp located on a unit of 5,000 to 10,000 acres. Tractors are used exclusively by the Grain Trust. The only animals used are a few saddle horses.

The U. S. S. R. is a large producer of petroleum products such as fuel, lubricants and greases,

which is an important factor in the extensive use of tractors.

The transportation of grain from combines to elevators is a rather serious problem, particularly where the hauls are very long. However, the experimental use of thirty to forty combines in the summer of 1929 so convinced the officers and technicians of the Grain Trust that they plan to use over one thousand combines in the harvest of 1930. These combines will largely be distributed in units of ten to twenty over practically the entire grain growing area.

There are many methods now being employed in U. S. S. R. for reorganizing the former crude peasant system of producing grain. In this system each peasant family would handle from one to several small strips of land, using very crude

virtually no roads, with the few exceptions where stone paved roads have been built between some of the important cities. The roads connecting villages and providing means of communication with the small farms are really nothing but rutted wagon trails, there being no attempt to grade the roads and in some cases no bridges are provided over the streams. During rains these trails become so rutted that the peasants automatically shift back and forth on to and off the cultivated fields, with the result that a considerable crop area is more or less damaged by fall and spring travel.

Winter travel in most of Russia is carried on by means of sleds. There is a tremendous opportunity for the building of graded dirt roads in U. S. S. R. These roads can be built at a minimum cost which will run somewhere between 100 to 200 rubles per kilometer, not including the cost of culverts, bridges or special water ways. In the Caucasus

camels, horses and oxen are all used for transportation. A wagon is a very essential part of the peasants' equipment since he hauls all machinery and his entire family, who share his labors, to and from his fields every working day and all produce over sometimes a considerable distance to market.

Lumber is quite scarce in the south of Russia. It is imported from the north of Russia in the form of poles. These poles are either used directly in the building of various structures, or are sawed by hand where boards are desired.

Contracts—Courtesy

THERE is a bit of the nomad in most of us and perhaps that is why the sight of a loaded moving van gives us a thrill, although, personally, we seem to have taken root and become permanently established.

I rejoice when a family of newcomers move onto a deserted farm nearby, and I envy them the planning and high hopes that accompany embarking on a new venture. How wonderful it would be if the result were always as fine as are the anticipations. A bit of caution will help toward desirable results.

There comes to my mind one instance where the contract between owner and tenant was not filled out until after the latter had moved—the contract proved very unsatisfactory. It pays to have the completed contract, minus signatures, at hand for several days, and this applies to any form of legal document. Careful unburied study of the wording sometimes reveals omissions, and one comes to observe that many seemingly superfluous legal phrases are of real importance. Our careful reading of a gas lease revealed that the word thereafter had been substituted for the word therefor and extended indefinitely the time limit when operations must begin.

The man desiring a tenant should see that whatever he furnishes, tools and livestock, is in good condition. It is well that the tenant may not be blamed for breakage or loss that occurred before his arrival and that he may be held to account for stock on hand.

The attitude of a farm owner decides to some extent what kind of tenants he can keep. Does he furnish good equipment, decent, respectable living quarters, a fair chance for his tenants? Each farm has a reputation which is mostly a reflection of the owner's character.

M. C. S.

Top.—The first time that two combines were pulled by one tractor created a great deal of interest on the part of Russian engineers, agronomists and large farmers.

Center left.—Peasant and family homeward bound after a day's work on a grain farm. The camel is used largely as a draft animal in the South Caucasus. Center right.—Tractor used by a commune in the North Caucasus. This machine with two others furnished practically all the power on a farm of 10,000 acres.

How grain is handled on a state experimental farm. The tractor hauls six to eight wagons, each carrying three to three and one-half tons of grain. Trains were hauled over the fields as well as on the roads.

machinery, and in some cases doing all the work by hand. For a number of years Russian peasants have cooperated in purchases and in certain farm operations. For example in many districts steam threshing outfits were collectively purchased and used for handling the threshing for quite a large number of peasants. The government is now attempting to further consolidate these groups so as to completely merge their land into larger holdings, which will be handled by government-purchased equipment operated in part by trained operators, also furnished by the government. In most cases the government also furnishes tested seed. In return for this government aid the peasants are expected to sell to the government a certain percentage of their crop.

Transportation of commodities in all parts of U. S. S. R. is a very serious problem. There are

BARTLETT nodded as he sucked ecstatically at his newly-lighted pipe. "Uh-um—wants you to settle—I reckon you know." He puffed out a cloud of smoke and picked up the oars. Crumb was gravely silent as they rowed ashore.

The watch-house was an unusually large one. It had a platform running completely round it and it boasted two rooms, a big living room with a cot, table, chairs and stove, and a kitchen which had three bunks, two on the side next the door and one the right of the east window. Eden Crumb was reclining in this one, his lame back bolstered up with several dingy pillows. He was a wild-looking fellow, taller and leaner than his brother, Mark, with intensely black eyes and picturesquely long hair that curled up at the ends. There was an air of bravado about him and a covert grin on his lips, which the twinges of rheumatism could not wholly wipe off.

Sheppardson was a thick, red-necked man with large golden freckles on his muscular arms, which were bare to the elbow. His lower jaw thrust forward in a hard, imperious way that was backed up by the expression in his cold pale little eyes, but when he spoke Toots was startled. The voice was a thin pipe, oddly at variance with the outward character of the fellow.

When supper was over Mark Crumb and Sheppardson drew their stools up to the head of Eden's bunk and began a colloquy in earnest but whispered tones. Mark seemed to do little more than lend an attentive ear to what the others were saying. It was an argument of some sort evidently. Bartlett took no part in it except through his eyes, which strayed frequently to that part of the room. He drew Toots to his own bunk, sitting on the untidy heap of comforters, with his legs dangling, and began to pump the newcomer.

It was about as easy a process as getting water out of a dry well. Though Toots wore an air of guilelessness, Bartlett got no information whatever. Instead, he found himself imparting it. Sheppardson, he said, had formerly been captain of a run-boat—that is, he had taken oysters from the coast and other places for the post, a job which was not very profitable, but it was a job.

Next day, he said, he had taken a run-boat to the coast and had taken a job which was not very profitable, but it was a job. He had taken a run-boat to the coast and had taken a job which was not very profitable, but it was a job. He had taken a run-boat to the coast and had taken a job which was not very profitable, but it was a job.

"But you don't want to think you can step on his toes, either," added Bartlett. "Or on Mark's. Mark's a slow man to start, but he's learned hard to stop before anybody has a chance to get about with him and likely as not back up the next minute, or head off on another tack. The only certain thing about Eden's uncertainty is—"

Sheppardson left presently, Mark accompanying him to the door where his skiff lay. He was gone a long time. Eden, who had been yawning and grunting alternately, stretched himself out with his face to the wall, declaring he was going to sleep if he took a leg.

"Guess I'll turn in too," said Bartlett. "Your beds in the father room, Pouche. You'll be warm enough 'cos we keep this door wide." He began to undress and Toots, acting on the hint, followed his example. He was not quite ready for bed when Crumb came in, in rubber boots and black beard glistening with moisture. Crumb removed his outer garments in silence and sat down by the kitchen table. As Toots lay on his cot he could see him through the open door, the lamplight shining full on his face, revealing his peculiar circular eyes fixed in a stony stare under his black brows.

TOOTS closed his own eyes and arranged his body to fit the sag in the cot's springs; but presently he opened them to steal another look at Crumb, who still sat in the same rigid, hypnotic pose. A steady, comfortable bass snoring came from Bartlett's bunk, while thinner, more broken sounds from the other side of the room indicated that Eden was getting some relief from rheumatic pains. There was evidently no reason why Toots also should not go to sleep. Probably it was Mark's habit to sit up to all hours of the night this way, gazing tragically into space, as if he'd lost his last friend. If so it was very unpleasant of him.

Crumb moved at last, with a loud sigh. He got up and walked toward his bunk. "He's going to bed," Toots thought with relief; but instead Crumb thrust his hand under the pillow and drawing out a book, returned to the table. The book was unmistakably a Bible. He ran the pages over

A Thinking Job

By Fisher Ames

Copyright, 1920, by Cuyper-Harman-Stoen Company

with a stiff, stubby brown finger, found the desired chapter, and began to read, his lips moving soundlessly over each word. At intervals he lifted his head and gazed raptly at the ceiling. On one of these occasions the lamplight struck glitteringly on something that rolled slowly down his cheek and lost itself in his black beard. Toots realized that the object was a tear.

For some reason or other Crumb was struggling with a strong emotion. It was not just a wave of religious fervor passing over him that caused him to cry. There was a look of suffering in his stony glances and bent brows, and his free hand was clenched. Two or three times he got up and walked back and forth across the room, his feet in their heavy woolen socks pad-paddling like the paws of a bear pacing restlessly in its cage. Then he would return to his reading as if he hoped against hope to find the solution of his trouble there; but it was plain that he did not.

Suddenly he rose and threw the book from him. "It ain't no use. I got to help myself," he said. "I ain't nothin' to you, O Lord! Nothin'." He clutched his thick black beard in both hands, his elbows against his breast, and eyes raised in an agonized look as if making a last appeal for divine aid. Slowly his expression changed to one of weary hopelessness, and with a gesture of despair his arms dropped. After a moment he turned and blew out the lamp.

Toots heard him groan as he undressed in the dark.

The next day they were tonging on Mark Crumb's best oyster bed, the bateau anchored against the thrust of the ebb tide, which had dropped sufficiently to let them see the greyish-yellow surface of the flat and even some of the

saucer-shaped depressions scooped out by the bills of feeding wild-fowl. "The spat caught mighty poor last year," observed Bartlett, tossing back a number of empty shells he had brought up. "That new bar to the north don't let the tide spread out any more. It's narrowed up the channel so all the water comes a-sweepin' 'cross here twice as fast as it used to. You can't expect no spat to ket up with the tide runnin' this way. She's all swep' down to the lower beds—which don't do us no good."

"It was Providence, not we-all, that made the bar," said Crumb tonelessly. "The spat sure didn't ketch though."

"There's ways of fightin' bad luck an' ways of layin' down under it," replied Bartlett oracularly, and he made it evident that he preferred to fight. "Anyhow what with the ice year before last and this current the bed won't be worth shuckin' mighty quick."

Crumb was silent for a time. "We've got a lot now," he said at length. He dropped his long pole across the heap of oysters and picked up the punt pole. Bartlett and Toots followed suit and propelled their bateau in Crumb's wake. The bed lay close to Mink Island with only the matter of a couple of flats and one wide channel between, hence it was unnecessary to employ anything but man-power in going and coming. On the way Bartlett explained his reference to the ice. There had been a long spell of unusually cold weather and the tides had not been able to carry the "bay" out to sea. It had thickened until it rested on the top of the bed and had "grown to" the oyster clumps—frozen around their bills—so that when it finally went out on a big tide it had carried thousands of oysters with it.

"An' the toughest part was it dumped most of 'em down on Rafe King's beds," added Bartlett.

The air on Mink Island seemed, as time went on, to be electrically charged. Toots thought. There was always a cutting edge to Bartlett's and Eden's grumbling and that edge seemed directed toward Mark. Strange remarks were dropped. Eden one night burst out with: "Are you man enough to stick to your word, or are you a-go-in' to begin over again and starve?" And Bartlett, chuckling, said: "We-all are not the only ones who've been down to it by a long chalk." Eden and Toots were applying pressure to Mark, trying to get him to do something or other; and Toots was sure that when he was out of the way the two men did not limit themselves to such veiled sayings.

THE dirty work of course fell to his lot and his wages were small, but his living cost him nothing and what he earned he could save. Toots was determined to save. He had a pretty fair idea already in his two hundred and fifty dollars, enough to set him up in the oyster business in a small way, but that idea appealed less and less to him. The business, he learned, was getting over-crowded, and there were many hazards in it. The Crumbs were not the only ones who grumbled. Toots kept his ears and eyes open if he did keep his mouth shut. He had learned that to ask questions was often the poorest way of getting information. The more silent you were the more confidential people were apt to be.

He was sent over to Big-Pound Marsh one day on an errand. Big-Pound lay across the bay and had a little colony of watch-houses on it where the roughest element of the fleet gathered at week-ends. There was a real pier running out into deep water and supporting a long, low shed where boats were kept in ice-bins in readiness for the "buy" or "run boats." Toots, tying up at the pier found King the man he wanted, right on the spot and half-drunk. Having delivered his message he inspected the bins in one of which a dozen big green turbot were lying on a bed of kelp. Beyond them, on a pair of low trestles, was a long, narrow, black box like a coffin. But why should there be a coffin in the fish-house?

He looked at it, reading the name A. C. Tuttle painted in white on the sombre lid, and passed on to the next bin as if his curiosity had not been the least aroused. King, smelling of whiskey and swaying at his elbow, began to chuckle.

"Reckon you wonder what that's for," he said, pointing at the coffin.

"Coffins are usually for dead folks," said Toots guardedly.

"Smart—but not quite smart enough," laughed King. "Sometimes they're for live folks. Know who A. C. Tuttle is? Well, he's fish and game warden here."

"And that there box is waitin' for him. All he got to do is to come pesterin' round yere, an' he'll all be see! He knows it's waitin' an' he knows he all are ready to put him in. We-all have writ him that seems fair," said Toots with a wooden countenance.

(To be continued.)

The

Farm Home

Six Successful Secrets

By GERTRUDE S. STEWART

A N ambitious young woman living on a small country place decided to try something new. She had read with ever increasing interest of women's success with poultry. So in May of 1928, she went into the chicken business. It was a field entirely new to her, and she made frequent visits to the State Experiment Farms, twenty miles from her home.

She bought two hundred day-old baby chicks of a reliable firm, and carefully followed the directions and suggestions of the State Service as to housing, brooding and care. October first found her with one hundred twenty-four fine pullets in tip-top shape for high priced autumn eggs. The cocks had gone into the broiler market.

You will be interested in these figures from Mrs. Johnson's farm account book. Monthly egg record: October, 1928, 424; November, 2,047; December, 2,643; January, 1929, 2,444; February, 2,685; March, 3,114; April, 2,778; May, 2,513; June, 2,270; July, 2,002; August, 1,777; September, 1,041. Surely that is a splendid record, and if we have any readers who can beat it, do write and tell us how you do it.

Secrets of Success

Mrs. Johnson has six secrets to which she attributes this success, and they are bound to help any one who leans toward poultry. Here they are: State service.—The Johnsons cannot say enough for the help given freely by the State Experiment Farm. They relied on this service and followed every detail. Their house was built in exact replica of those on State Farm. The care and feed was exactly as directed by the Station. You have the same opportunity, and your county agent is the state's nearest representative.

Good chicks.—A good start is a good consideration, and good, healthy baby chicks are the wisest beginning for worth-while pullets and winter eggs. Proper feeding.—Mrs. Johnson took no chances with the feeding of her fine brood. She followed the directions of state specialists who are constantly experimenting as to what is best for better results. We might as well benefit by their rich experiences.

Good housing.—Daily care of the hen house is as important as washing the breakfast dishes. Johnsons cleaned, scraped, scrubbed and disinfected. Chickens were not annoyed with lice or mites under daily cleanliness.

Water. Fresh drinking water was ever before these pullets, and the chill was not known to these layers. They know not what ice is.

Regularity.—A clock-like schedule was used in the feeding and care given this flock. The winter day was lengthened. Johnsons have their own electric plant and lights were turned on at six every morning during the winter months. No lights were used at night.

These are the six secrets on which Mrs. Johnson hinges her success. You see that after all, there was but one real secret, and that is the state help.

In My Garden

LAST spring a man who had called at our kitchen door spied my small flower garden and said, "Oh, what a shame to have that lovely spot way out here in the country. It ought to be in town where more people could see it."

But I do not agree with him. No one knows what a value we attach to that little plot of color. From early spring until late frosts, it fills our hearts with its fragrance and beauty, and enriches our lives with precious memories.

I have so greatly enjoyed the occasional letters from readers about their memory gardens, and I want to tell about mine and hope many others will do the same. Deep troubles and loneliness flee like magic when we stroll through this garden.

Here are hyacinths and daffodils, lemon lilies and gay iris, to remind us of happy visits and wonderful dinners enjoyed at Aunt Mary's. Visions of the old home come to us as the narcissi and tulips burst into bloom, and what memories the stately Madonna lilies bring!

Roses, corymbiums, hollyhocks and golden glow remind us of Grandmother's garden. The brave golden forsythia almost bursts into song as

One hundred twenty-four pullets brought to Mrs. R. C. Johnson a profit of \$451.96 in their work for one year. Even in zero weather, this little basket could not carry one day's eggs. Read her success secrets on this page.

it tells of school days, and the moon flower came from College Hill, too. Our first little home had one bush, bridal wreath, and home would not be complete without it.

Here and there we are reminded of pleasant trips or cross-country hikes. Hoosier beauty and sunburst roses carry us back to old Virginia, and yellow violas, jack-in-the-pulpit, and laurel leaves us at Conowiega Dam. Coon-herry bushes, Indian fire bush, wild asters, wild iris, wild tiger lilies, and many others whisper love of native haunts.

All this beauty graces a backyard which but a few years ago, was a miserable rubbish heap and weed patch. We have worked, to be sure, and are being abundantly repaid with almost daily messengers from these beautiful growing things.

Esther K. Crouse.

Quick Work on a Hard Job

WHEN an iron skillet shows burned grease on the outside take off the top plates of the kitchen range when there is a good hot bed of coals and put the skillet edgewise on the coals and let it get red hot. Turn until it has been red all the way around, then scrape with a limber knife and every bit of grease will come off like magic and after being washed in good soap suds it will look like new. Note: If you have a furnace, just lay it on the hot coals.

Mrs. S. M. A.

A Deadly Pair

OPEN wells and loose boards with nails sticking through them are daily destroying the lives of many innocent children on our farms and in the rural villages.

Let us use a bit of carpentry, and do it now, to safeguard our own and all little children. Both of these great dangers can be so easily overcome.

The Question Box

PLEASE tell me how to remove wax crayon marks from wall paper.

Mrs. H. K.

With a thin sharp knife blade, scrape away as much as possible. Dissolve remaining marks with a small pad saturated with gasoline. Work lightly and very quickly. Use dry pads to mop away what dissolves. Have no open flames while at this work, as gasoline is exceedingly inflammable.

The Farm's Best Crop

By HEPSY NEFF

THE sudden changes in the weather, lying just ahead of us, call for more attention to the feeding of growing children than even the steady cold of winter. Schools that have provided for a warm school lunch have seen its value and will continue their good work as well as advocate the same for other schools. In no school, city or country, has the use of the warm lunch failed to bring gains to the pupils in alertness of mind and better work generally.

Perhaps most of our readers know of the good work being done by the National Dairy Council, a farmers' organization now beginning to bear fruit in more than a dozen states, particularly in its work for the better feeding of children. At its eleventh annual meeting in Chicago, last November, the nutrition specialist of this great farm organization, aided by Mrs. Lydia Roberts, professor of Home Economics in Chicago University, presented a very comprehensive report of the work and results of lunch room activity in schools of many states. For fear this report may not be as widely read as it should be the following typical "A" lunch, as established by these specialists is here given.

"Milk one-half pint or two foods containing milk, as ice cream, creamed vegetables or cocoa. One vegetable besides potato, a fruit and a dessert if desired but not essential."

A Working Program

But the Dairy Council is not alone in cooperating with local workers in the interests of better health for children. On May 1 of last year Secretary Hyde of our Department of Agriculture broadcast an address by speaking at the opening of Child Health Week on "The Country Child, the Farm's Best Crop."

The "White House Conference on Child Health and Protection," called by President Hoover in November, 1929, marked another long step in advance. From that conference came a working program by which every state in the Union can cooperate working through its own state officials. In addition to all these agencies several large organizations of forward looking citizens have for years been at work in the interests of child welfare. Among the largest of these is "The American Child Health Association" with headquarters at 370 Seventh Ave., New York City. This organization offers the record of Child Welfare and Health work by states in an attractive booklet to be had by writing the Association at the above address. Its slogan is, "Youth is the strength of America. Make American youth strong."

Since our government has officially declared May 1 as National Child Health Day and the beginning of Child Health Week, with the way opened for state cooperation, no state can afford to seem backward. The use of pageants made up of blue-ribbon children; (those who meet the standard of age-height-weight tests) shows, first of all, the level of community interest.

Preparing for such a pageant must begin months before. Perhaps some schools in wideawake communities may find considerable material for such a showing on short notice. But one thing any and all of us can do. We may have the report of the National Dairy Council by writing to their headquarters, 307 North Michigan Ave., Chicago, Illinois, and we may have the report of the American Child Health Association by writing to their headquarters, 370 Seventh Ave., New York City.

Improving Your Home Surroundings

THE most effective way to improve your home surroundings at little cost is to be always looking for little things that should and can be done at once. A little here and a little there means much at the end of the year.

Mrs. S. M. A.

Marketing Feathers

A GOOD way to market feathers that accumulate on the farm from dressing poultry for market is to make them into pillows and sell to folks who are going to start housekeeping. Weigh each pillow to insure uniform size. I get more orders for pillows than I can fill.

What more is needed?

- Low Mortality
- Rapid Growth
- Bigger Bones
- Bigger Bodies
- Better Feathering

Larro Chick Starter produces all of these—that's why so many poultrymen say it is the "last word" in Chick Starters.

J. Earl Gregory, Horsehead, N. Y., says, "Fed a pen of 500 chicks on Larro from the very beginning and raised 98% of them."

Geo. W. Sarano, Lexington, Mass., writes: "It was our intention to put only 900 chicks on Larro but the results were so outstanding (even growth, livability and feathering) that we put our entire flock of 7,000 on Larro."

At the Larro Research Farm Larro Chick Starter has been measured through seven years of the most severe tests that can be applied to a Chick Starter. More than 20,000 chicks per year have been used at this great farm in testing Larro Chick Starter against every known feed and combination of feed ingredients. **In every test Larro fed chicks outgrew those fed on other rations.**

And do you know that just two ounces more weight per chick at the end of six weeks (figured at 30c per lb.) increases your profit \$49.80 per ton of feed.

You'll never know how good your chicks can be until you feed them Larro Chick Starter. **It reduces mortality, produces rapid growth, bigger bones, bigger bodies and good feathering.**

HUBER'S RELIABLE HATCHERY North Main Street FOSTORIA, OHIO

birds. They should be over the molt by now and the more mash you can get them to eat the sooner they will lay.

The trouble you describe in your young birds may be due to range paralysis, but whatever is the cause, I think it would be helpful to rear young birds this spring in a different place away from the other birds.

If you need further help please write again. R. H. S.

To Disinfect Eggs

Can one use denatured alcohol to disinfect eggs before setting and a few days before hatching? What amount to use in pint of water by measuring spoon? Can you give me information on vaccinating turkeys for cholera, typhoid or blackhead?

Mrs. Ella G. Brown.

I HAVE been unable to secure any information, either published or unpublished, regarding the use of denatured alcohol as a disinfectant for hatching eggs. It is believed now that alcohol does not have the disinfecting value that we once thought it possessed.

If the egg shells are thought to be contaminated by germs of the harmful sort, they may be dipped with safety in a two per cent solution of a standard stock dip. They should then be allowed to dry without rubbing.

There is no information available relative to the vaccination of turkeys for typhoid, blackhead or cholera. We believe that if the turkeys are kept in a sanitary manner and fed only wholesome and uncontaminated feed, that a goodly number can be raised to maturity. H. C. K.

Green Wheat for Geese

I would like to know if geese that are allowed to run on green wheat will have fertile eggs. I have been told that geese eggs would not hatch if the geese were allowed to eat green wheat. G. E.

I HAVE been unable to secure any evidence which points to the fact that geese running over a wheat field would produce eggs which are infertile. It is generally recommended that breeding geese be given a good grass range and that they be fed grain regularly and some form of roughage during the winter months.

Care should be taken that the geese do not become too fat at the time of the breeding season, since poor fertility and poor hatches will result.

Oats are a very desirable feed for breeding geese. Very good roughage may consist of vegetables and clover or alfalfa hay.

Perhaps some of the readers of The Pennsylvania Farmer will be able to answer definitely your question regarding the effect on fertility of allowing breeding geese to run on wheat fields. H. C. K.

To Prevent Sprouting

O. H. A'S PLAN of preventing locusts from sprouting is a good one, though I doubt whether his reason given would stand the test, since the leaves of a locust tree when the bark is peeled off the trunk will die quicker than the roots will.

The locust is an everlasting sprouter if the roots are broken. Peel the bark around the trunk as soon as the sap is up and strip it down to the ground, and if roots are not broken the locust will die, root and branch.

Sassafras is easily killed if the trees are cut down and the land pastured for a year or two without breaking the roots. If the sassafras is girdled and pastured it will die, but if land is plowed it continues to spread and sprout thicker.

I have a patch of sassafras in a cultivated field that has required a continuous fight to keep down. This entire patch is from a single tree that was decimated, but the land was plowed before the roots rotted.

A. J. Legg.

How Mrs. Potts Saved 9% of all her chicks

Now Mrs. Potts (full name and address) writes: "I have been using the MARIETTA BROODER HOUSE for several years and I can say that it has saved me a great deal of money and trouble. It is a round house with no corners, and it is built of wood. It is very strong and durable, and it is very easy to clean. It is also very comfortable for the chicks, and it is very safe. I have never had any trouble with my chicks since I have been using the MARIETTA BROODER HOUSE."

MARIETTA BROODER HOUSE
Round House—No Corners
Don't worry about your chicks! Put them in a MARIETTA BROODER HOUSE, with the Vio-Ray Windows, which transmit the wonderful health giving rays of the sun into your brood, and your chicks thrive and grow into big profit paying birds!

The MARIETTA is the most substantial Brooder House made, with perfect ventilation; easy to regulate heat into uniform temperature. Let a sales folder with full information, or we will send you book on Brooder Houses and MARIETTA CONCRETE SLOES combined.

PEARL GRIT
makes eggs grow

A hen must have time in her system for eggs to develop. And there's no excuse for depriving her of it. Pearl Grit supplies all the grit a hen needs in the most palatable, most natural form. No sharp splinters to irritate the digestive tract. Supply your flocks with Pearl Grit. It's handled in bulk cartons and 100-lb. bags by hatcheries and dealers.

Get This Remarkable Book FREE

Read our book and learn the importance of grit in poultry feeding. Find out how Pearl Grit promotes growth of young chicks, keeps all birds healthy, stimulates egg production. If you're a poultry producer, you don't want to miss this book. Mail coupon or letter for it to: **PEARL GRIT CO.**, 101 Bridge Street, Fiqua, Ohio.

Cyphers Incubator

Size 144 to 500 eggs

Full and complete incubator with all the latest improvements. New reduced price. Write for details. **CYPHERS INCUBATOR CO.**, 100-104 Pearl St., New York, N.Y.

BABY CHICKS

March and April Prices: 25¢, 30¢, 35¢, 40¢, 45¢, 50¢, 55¢, 60¢, 65¢, 70¢, 75¢, 80¢, 85¢, 90¢, 95¢, 1.00, 1.05, 1.10, 1.15, 1.20, 1.25, 1.30, 1.35, 1.40, 1.45, 1.50, 1.55, 1.60, 1.65, 1.70, 1.75, 1.80, Last year a prophecy ...this year, PROVED PERFORMANCE

LAST YEAR we announced a new fertilizer—our NPK series, both containing 45% available plant food: one containing 9% nitrogen, 27% phosphoric acid and 9% potash; the other 9% nitrogen, 18% phosphoric acid and 18% potash.

Many farmers used it under average farm conditions. Reports from these show it to be practical and economical. For example, one potato grower compared it with a home-mixed fertilizer and showed a net gain of \$28.62 per acre by using NPK.

NPK fertilizer is in splendid mechanical condition, free from lumps, is not sticky and is easily applied with present fertilizer distributing attachments. Farmers are using from small quantities per acre on corn to nearly 1000 lbs.

on potatoes and other heavily fertilized crops.

NPK fertilizers are made under the most careful scientific direction and control. They have the correct ratios of plant foods for different soils and crops, insuring a balanced ration—a factor which is as important to plants as to animals.

With NPK fertilizer the crop is assured of timely and completely available, carefully selected plant food. NPK is a forward step in increasing soil fertility. It improves the quality of crops, increases the yield, decreases growing costs and improves the market value.

There is an Armour dealer near you who is ready to advise you and to supply your needs. If you do not know his name, write us and we will name you prices in quantities as small as a 100-pound bag.

A Weeder Designed for Use With Tractor.

Agriculture Engineering

By R. U. BLASINGAME

THE weeder was a good tool from the start, when it made its appearance some years ago. But it failed to a large degree because the manufacturer didn't know how to sell its use properly. Or maybe farmers did not recognize just how to use it.

Maybe I am writing this article about the weeder in a way which is not considered good journalism, if that term can be applied in my case. I began by calling attention to the weeder as a failure. Well, let the chips fly where they will. Anyway, one distributor of weeders in the state said he did not seem to be able to get the machines fast enough even though he bought them by the carload.

I feel sure that Dr. E. L. Nixon of State College had more to do with bringing the weeder back and into successful use than any one else in the East. He saw the value of the weeder for cultivating potatoes because it has value other than killing weeds.

The reason the weeder failed at first was because farmers waited until the weeds were about three to five inches high, then they got the machine out, and one trip across the field demonstrated the fact that large weeds were not destroyed. Often the weeder was left in a fence corner to rust.

Now the new idea is to begin to run the weeder in the potato field before the crop comes up, and continue to run it every week or ten days until the potatoes are 8 to 10 inches high. The small weeds are killed before they get a start, in fact, about the time they sprout.

The ground may become too hard for the weeder to take effect. When this condition arises a cultivator has to be used to loosen up the ground, then the weeder can tear out and cover the small weeds.

Other Advantages

Of course the principal object of the weeder is for killing weeds. It usually covers several rows even in the horse-drawn machine sizes. For this reason it is a very economical cultivating tool, because it covers a lot of ground in a short time.

Another advantage, some potato growers point out, is that the weeder, being run in the same direction each time through the field, lays the vines down and the branches have access to the sun and grow rapidly, thus producing more leaf surface. It is the leaf surface exposed to the sun that makes potatoes.

Still other growers say that the vines in this position can best be sprayed to control disease and insect pests.

Another feature, some point out, is the fact that the weeder teeth prune off the roots of the potato vines close to the surface of the ground, thus causing the tubers to be formed deeper under ground. This, they say, prevents sun scald of potatoes.

Thus it appears that the weeder has desirable features other than that of merely cultivating.

Tractor Weeder

With the advent of the general purpose tractor one well-known weeder manufacturer has "taken it by the forelock" and developed tractor machine. This weeder can be controlled from the seat of the tractor. In turning at the end of the row either end of the weeder can be raised to prevent it digging in the ground.

In fact, both ends of this weeder can be folded back to go through gates. The flexible ends also allow flexibility of the machine to conform to irregularities in the field.

This machine was shown at the Farm Products Show at Harrisburg the week of January 21st, and created a great deal of interest among several potato growers bought them.

There are a good many growers who have turned to the general purpose tractor for all of their farm work because equipment for even farm job has been developed. As with the tractor one man can accomplish so much more in a day than with a team. In any line of business one has to watch competition. If other fellow in the same business can produce the same commodity cheaper than you can it is time to look up the proposition.

A few years ago there was one general-purpose tractor on the market. Now there are six, which gives one quite a range of choice.

The mechanical power age in agriculture is here and the tractor weeder will play a prominent part in the economic production of both corn and potatoes.

A general-purpose tractor is at home in the corn field when cultivation time arrives.

The All Purpose Tractor

By R. U. BLASINGAME

AGRICULTURE in this country employs more power than all of the other industries except transportation. This vast quantity of power, necessary to drive the machines of agricultural production, is made up of about four million mules, around sixteen million horses and the remaining twenty-eight million horsepower consists of trucks, tractors, gasoline engines, electric motors and windmills.

Feeling that our readers are well acquainted with the horse-drawn equipment so commonly employed in agriculture, we are going to devote this space to the "all-purpose" tractor. It will be called all-purpose tractor because each manufacturer has a different name for his machine, but they all will plow, make a seedbed, seed and plant, cultivate, harvest, thresh, fill the silo, run the feed mill, saw wood, etc. The all-purpose tractor is then a unit farm power plant.

International Farmall

One of the first successful all-purpose tractors to come on the market was the Farmall which is manufactured by the International Harvester Company in Chicago, Ill. This machine has had such universal adaptation and has established such a keen demand by farmers that the future of the all-purpose tractor is assured.

Following are a few of the specifications of the tractor: 1. Pulls two plows. 2. Power take-off at rear, runs about 530 r.p.m. 3. Tread of rear wheels can be altered to accommodate 42-inch corn rows and 34-inch potato rows. 4. Wheels equipped with vine guards or turners to prevent damage. 5. Can be equipped with either spring-tooth or spring trip cultivator. 6. Can be equipped with either two or four-row cultivator. 7. Mower attached at rear on the drawbar and operated by power take-off. 8. Clearance for cultivating corn same as that for horse-drawn cultivator.

John Deere General-Purpose

The next all-purpose tractor to appear was the John Deere. It has four wheels arranged to track, appearing very much like the conventional type tractor, except the clearance is that of the usual run of corn cultivators. It has a power take-off which runs about 553 r.p.m. A mower has been developed for this tractor which rests on the drawbar and operates by the power take-off. The John Deere G-P tractor plants and cultivates three rows at a time. It is powered by a two-cylinder engine, which handles two plows and the other tools of the usual run of a two-plow tractor. The John Deere Company's home office is at Moline, Illinois.

Rumely DoAll

This tractor made its appearance in the East a year ago, at the Farm Products Show, Harrisburg, Pa. It is made so that the front axle and wheels can be removed and the cultivator attached at the rear. To secure clearance for cultivating corn the arch of the axle is moved upward by sliding in one of the forward gears and cranking the engine over a few times with the ignition (or magnet) grounded to prevent the engine starting.

This tractor pulls two plows, the other drawbar and seed machine of similar size. When the cultivator is attached a large caster wheel is employed at the rear, for support, and which makes turning at the end of the rows a very satisfactory job.

Case "CC"

The J. I. Case Company, Racine, Wisconsin, has recently announced an all-purpose tractor. They call it the "CC," meaning cultivating as distinguished from the "C" tractor which (Continued on page 39.)

Get to market First this Year

A week ahead in TIME may mean a year ahead . . . in PROFIT

This entire field was planted at the same time. Note difference between paper mulched area in rear and unplanted area in foreground.

GATOR-HIDE allows you to haul your produce to a waiting market instead of a glutted one. . . makes it possible to secure TOP instead of BOTTOM prices.

Gator-Hide stimulates, promotes, HASTENS plant growth by the simple expedient of raising the soil temperature and preventing evaporation of the soil moisture. Melons, berries, vegetables of all kinds growing under Gator-Hide not only mature

EARLIER but experience proves they are bigger, better, more flavorful and in general of higher quality. Actual tests show increases in yield from the same soil of 25% to 200%.

Gator-Hide saves labor too. Weeds cannot come up in soil that is covered by Gator-Hide. They're BLANKETED. If your dealer is not yet stocking Gator-Hide write us direct. But by all means see him first. And send coupon without fail for free booklet.

The all-purpose tractor saves time in cultivating corn. Other makes of such tractors performing different farm operations are shown on our cover this week.

Farm Equipment in Review

By TUDOR CHARLES, Jr.

IMPLEMENT dealers in practically every farming community will set aside a certain day or week, this spring, when farmers will be especially invited to come in and view the new models in machinery and appliances—of which there have been an unusually large number during the past year.

While most of these improvements have been refinements of standard equipment, some of the useful attachments or new tools are almost revolutionary in character; in any case, the developments are of direct interest and of real importance to the farmer who realizes the need of keeping his production costs to the minimum and who is figuring on ways and means of saving labor and time in his coming year's work.

More new tractor models appeared than in any year since the war period, if we can depend on observations. Outstanding among all of these models is a tendency toward lighter weight, with more power in the field and on the belt. Along with these traits, low fuel consumption and, we might say, hardness are also included. The trend is distinctly toward dependable, long-life machines, with plenty of power, and as little excess weight as possible.

General-purpose tractors have been featured. Some of the more or less individual developments are adjustable width of rear wheels, narrow rim

wheels to reduce packing, and convertible styles.

Among other new ideas found in the 1930 tractor family are rubber-tired wheels which may be used for road hauling; a power lift for raising plows or cultivators while the outfit is stationary; additional forward speeds for faster operation on the highways, and a variety of other individual features. In addition further standardization and application of the power take-off has been carried on. Sprayers, binders, corn pickers, plows and mowers are tools to which this principle has been applied.

Attachments which have broadened the use of certain machinery are ingenious and valuable. For instance, a seeder has been made for the one-way disk, which is itself a relatively new implement. The seed-box sits over the disk cylinder and flutes run down along each disk. Wheat, clover, grass or other small grains are sown.

Disk-harrows on which the disks are adjustable in spacing are now available. They may be set close for plowing loose soil or stubble, and again they may be spaced wide for turning under a heavy growth of soy beans or clover.

Another seeding attachment is a device which drops clover seed in the corn middles at the last cultivation. By using this method, a stand of clover may be secured in early fall, and plowed under the following spring.

At corn-planting time the all-purpose tractor is found well adapted for this work.

METCALF'S

Seeds of Known Origin

NOW Is the Time to Buy Grass Seed and METCALF'S is the Place

All Clover and Grass Seeds are Verified as to Origin by U. S. Government Authorities

OUR GRASS SEEDS are grown in the localities where climatic conditions develop the greatest vigor. All our Clover and Alfalfa Seeds are verified as to origin by U. S. Government authorities. We do not handle clover or alfalfa seeds imported from any part of Europe. Our Alfalfa Seed comes from the Northwest; it is hardy enough to withstand our northern winters. We lay great stress on purity and test every lot of seeds for germination. Every bag carries a tag showing the results of these tests.

These Prices Good Until March 1st

All Bags Free—Order Direct From This Advertisement

Red Clover

Metcalf's Re-cleaned Mammoth—Domestic

This is the large-growing "pea-vine" clover—an enormous yielder. Strictly northern-grown seed of high vitality and germination. Price—\$14.40 per bu. of 60 lbs.

Metcalf's Re-cleaned Medium—Domestic

In more general use than any other clover—our seed is the best obtainable. Price—\$14.40 per bu. of 60 lbs.

Timothy

Metcalf's Re-cleaned—99.60% to 99.85% Pure

An A-1 quality seed, bright and plump. No better obtainable at any price. Price—\$3.65 per bu. of 45 lbs.

Timothy & Alsike, Mixed

For those who like good mixed hay, this is a real bargain. Contains 20% Alsike. A good, clean mixture that can be safely planted anywhere. Price—\$5.25 per bu. of 45 lbs.

TERMS—Cash with order or half cash and half arrival draft

FARM EQUIPMENT WEEK

There is some new tool that will cut the cost of some operation or put an end to some old-fashioned way of doing something about it. In order to present its new models to the public the automobile industry, at an auto show in leading cities every winter. Farm equipment manufacturers show their latest developments in the small towns during Farm Equipment Week, which this year is to be held February 7-12. At this time local dealers will be able and glad to show and explain the latest models of labor-saving machines for farm use. It will pay to visit the dealer next week and see what he has to offer to help cut the cost of production.

Speaking of cultivators, use of wide-bottomed shovels instead of the regular size has proved beneficial for the corn plowings. These wide-bottom shovels sweep the surface soil and get away weed in the middle, but do not harm to shallow feeding corn roots. The necessity or advisability of deep cultivation has been disproved, as it has been repeatedly shown that the benefit of late cultivation lies in the killing of weeds.

Now let's take a look at the corn planter. We see an increasing number of fertilizer attachments for hill dipping the commercial product and the seed kernels. This method reduces the expense of application, as well as being positive in its results.

Two more devices improve the corn planter's activities. A rudder for holding the machine on the row on steep hillsides has its particular uses, and a double-disk affair which attaches back of the planter parts ridges soil over the row and prevents washing, until time is allowed for the ground to become compact. It is also said that squirrels and other small animals which sometimes dig up the corn hills do not bother when the kernels are placed deep at planting time.

Tillage machinery has undergone much development particularly in the way of equipment for tractor use. A plow which has two sets of bottoms, and is designed for turning the soil all in one direction, has been brought out. This implement has its greatest use on steep slopes where the operator wishes to turn all of the soil one way.

Plows and Cultivators

Wide-bottom moldboard plows are drawing attention as a means of killing trash. Advent of the corn planter problem has directed interest and the question of "clean" plows.

One-way disks are practically the only new use has been developed in this valuable machine. At the Bureau Polytechnic Institute, agricultural engineers have successfully built and maintained wide-base tools by turning the soil in from both sides with the disk. Only three or four turns across the field are necessary to throw up a sufficient embankment. Field cultivators have been used in the Northwest and Canada for a number of years, but last summer they found states further south and east large numbers. These tools may be used either with stiff shank shovels or spring teeth. When the former is employed, the shovels used continually wide sweeps known as "chisel" teeth. Users of field cultivators find the chisel sweeps for stunting and killing particularly, as they break the soil in a mellow condition and control a drabby soil.

For making an especially strong and durable weed, however, the best opinion is that spring teeth are the deadlier weapon. Machinery makers have designed a long curved teeth which tears at the roots of perennial weeds, and leaves them on the surface, in a mutilated condition.

In eastern potato growing sections farmers have found a valuable tool in the orchard harrow or "jostler." This implement, a cross between a subsoiler and a weeder, gets down into the

Take care of the Soil!

Two reminders to our farm neighbors

1. In three-fourths of the crop producing land served by the New York Central Lines, limestone is definitely needed and will increase the yield. Practical farm experiments show that an investment in limestone returns dividends of 70% per year!

Does your soil need limestone? Test it and take no chances! The New York Central Lines, from long experience, advises the liberal use of limestone and the growing of legumes... Lime early!

2. Commercial fertilizers are a real necessity in modern farming—with practically every crop grown. Every carefully planned rotation involves their regular use.

Have you ordered your fertilizers yet? Ordering now is good business... and the spring may be early!

In its fundamental job of transportation, New York Central Lines are happy to work closely with the other fundamental industry—agriculture.

The Story of Woodbine Farm

By W. D. ZINN

CHAPTER VII

WHEN a young man reaches the age of twenty-two and has decided that he cannot go to school any more, the sooner he gets married the better it is for him, and perhaps the better it is for the community as well.

In looking about for a wife there were several things I considered. First, I wanted to marry into a family that had good blood circulating through its veins, for I believe it is much more important to consider blood lines in people than in livestock. Again, I wanted a wife who was at least fairly well educated. This was not only because I believed an educated girl is more likely to make a good home-maker, but because, if she became a mother, the children would be better trained.

I did not follow the suggestion of a certain rich man, who said to his children, "Marry for love, but love where the money is."

On October 23, 1879, I married Florence Swearingen, the daughter of William Festus Swearingen, a Civil War veteran and Baptist preacher of Marion county, W. Va. Her mother was Mary Elizabeth Martin. Festus Swearingen died in 1867, leaving his widow with seven young children, six girls and one boy. The neighbors said to her, "Mary, the only thing you can do is to break up housekeeping, and put the children out." To which she replied, "Not while I have nails on my fingers."

They had fifty acres of thin land with a cottage on it. Mrs. Swearingen not only fed and clothed her children, but educated all of them to such an extent that six of them became teachers, three of them graduating from the Fairmont State Normal School.

Mrs. Swearingen went to her reward on the 16th day of September, 1911. I have often told her that her poverty was a great blessing to her sons-in-law. The daughters all made industrious, economical, good housekeepers. Their mother will live as long as her daughters live, and it is to be hoped, as long as any of the great, or great-great grandchildren live. We live in the hearts and lives of those we leave behind us.

Always Optimistic

Because part of her life had been spent in the town of Fairmont, my good neighbors thought I had made a mistake by marrying this girl who knew little or nothing about farm life. I do not mean to criticize my neighbors when I say this, for it was perfectly natural for them to form that conclusion.

I reasoned in this way: "This girl has spent part of her life in the country and knows something of its hardships as well as its pleasures. She comes of a good family. There have been no criminals among her ancestors, neither had there been any inebriates. If she can teach a successful school she has intelligence enough to learn how to meet the requirements of a farmer's wife."

My good neighbors were certainly mistaken in their guesses about the new woman who had come into their community. Many of them lived to enjoy her hospitality and all were convinced that she knew how to cook and keep house. She did more than that, she became a real helpmate, sharing in her husband's pleasures, but, at all times, willing to share and sympathize with him in his sorrows

and disappointments as well. She has always been willing to set aside her own pleasures for others, particularly for her children, who will never know the sacrifices she has made for them.

We were poor when we started in married life, but amidst all this poverty and doing-without, my wife was never known to complain because we could not be "fixed" as well as were many of our neighbors. She has always been optimistic. When her husband was downcast on account of a failure of crops, poor seasons or bad markets, she always had words of cheer for him. I am not sure but that sometimes I would have "given up the ship" had it not been for her words of encouragement.

Her father having died when she was 10 years old, resourcefulness and economy were early learned in the school of experience. She

and her sisters were always fairly well dressed but they did it by taking good care of their clothing and working their dresses over several times. These lessons in frugality stood this girl in good stead later in life when she became my wife and we were faced with the problem of winning a livelihood for ourselves and the children that later came to live with us.

I never saw the time when our pantry was not stocked with canned fruits, vegetables and meats. While many live out of cans bought at the store we have never spent many dollars for eatables of that kind. I attribute largely what financial success we have had in life to the fact that we have produced on the farm almost our entire living. I never had a store bill of any considerable amount. Instead we usually had a credit in the store where we did our trading. I do not remember of ever buying a store broom. We always grew our own broom corn and had our brooms manufactured.

Lived Within Means

Unlike many young people of the present day we started out with the determination of living within our means. If we needed something for which we did not have the money to pay we did without it if it was at all possible.

Our house was very plainly furnished but we were happy in the anticipation of having better furniture in the future. Many people make their lives and the lives of those around them miserable by continually bemoaning the fact that they cannot have what others possess. To be content with one's present circumstances and to strive to make them better in the future is a very commendable trait in any one's character.

My good wife has worked very hard during her married life, but I rejoice that the time has come that she can take some rest if she desires it. Her cares are not as onerous as they were when we lived on the farm and when we were trying to make money to lift the mortgage. She may now enjoy, if she will, the fruits of her labor.

If these lines should be read by a young farmer who is starting in debt in life, let me whisper this in his ear: "Do not make the mistake I made in buying too much land, and in paying for it allow or require your good wife to break herself down. Instead of buying another farm provide conveniences in the home and that

conserve her strength in order that she may enjoy good health when old age steals upon her." These conveniences were placed in the house on Woodbine Farm but they were too late in arriving.

Let me confess to another mistake I made in early life. We had only a very small bank account even in the most flourishing seasons, and I failed to see to it that my wife had some means of earning her own money and of carrying her own pocketbook.

On my return home one day I noticed that she had been crying—a thing that she rarely did, for she was of a very cheerful disposition. I asked her what was the matter and she said: "Oh! nothing," and walked into the dining room. I went to the dining room and said: "I know there is something wrong. Please tell me what it is." She went into the kitchen but I followed, still insisting on her telling me what had happened. She finally burst out crying and said: "I had to take 50 cents out of your pocketbook while you were gone."

Only this was I taught that the wife should have her own pocketbook and have some way of filling it. She now has it and for many years she has had her own bank account. In former years I felt that whatever money we had belonged as much to her as it did to me but she could not feel that way. For many years she practiced such strict economy that it is really hard to induce her to spend enough money on herself now. She is always willing and anxious that the other members of the family shall spend money for their comfort.

The law in West Virginia is very unfair to the widow. Every husband owes it to his companion to see to it that she gets a square deal in the event of his death. The only way to do this is by making a will. When two young people start out in life without possessing any of this world's goods and accumulate a small or a great fortune, that fortune belongs as much to the wife as it does to the husband. But if the husband dies and the law takes effect in the settlement of the estate and the estate consists of realty, the wife will fall heir to only one-third of the property and that for her lifetime only, while the children get the other two-thirds. If there be no children and the real estate is in the name of the husband, two-thirds of the estate goes to the husband's nearest kin, who also receive the remaining third on the death of the widow.

Calves Not Thrifty

A READER writes that he has a lot of calves and they are not looking very thrifty. What could be wrong with them? Many things might be wrong. Calves should never be fed over-ripe timothy. They should always have some kind of legume hay and that should have been cut before it was too ripe. Prof. Crech of the Animal Husbandry Department of our University says that 90 per cent of the calves of our state are lousy. Calves cannot look thrifty if they are covered with lice. There is no market for lice and it is poor policy to fatten them.

These calves might have lung worm. Better call a veterinarian. Calves with lung worm cough incessantly.

WHEN the Farm Loan Act was passed by Congress I said: "What a blessing to farmers and how I wish we could have had it passed when I was starting in business for I was in debt for thirty-five years."

The principle is all right but too many farmers have abused their privileges. Instead of borrowing the smallest amount that they could have got along with they borrowed all they could get and then began to buy what they could have done without.

It is sometimes wrong for a father to let his children have too much money and it is always wrong for Uncle Sam to let farmers have more money than they really need.

Oliver Red River Special Thresher and Oliver Hart-Parr Tractor

The Finest, Fastest, Cleanest Thresher

Now under the Oliver Flag, the finest, fastest, cleanest thresher—the Nichols & Shepard Red River Special awaits the farmers and threshermen of America.

Finest—because it offers all the latest improvements in bearings, lubrication, pulleys, materials and construction.

Fastest—because double belts running on fibre pulleys driving shafts revolving in roller bearings keep every part running at the smooth, even pace set by the Big Cylinder to do clean threshing fast and keep the machine threshing at capacity.

Cleanest—because it is built around the famous 4 Threshermen—the Big Cylinder, the Man Behind the Gun, the Steel Winged Beater and the Beating Shakers, the greatest combination ever devised for getting the grain from the straw.

You will be interested in our new book "Under the Oliver Flag—Bigger Crops at Lower Cost." Send coupon for a copy and complete information on the Oliver Red River Special Threshers.

500,000 Farmers Have Borrowed from the 12 Mutual Federal Land Banks a Billion and a Half Dollars at an average interest rate of 5.4%

THIS \$1,500,000,000 in long-term loans secured by first mortgages on their farms provided much needed capital during a period when funds were scarce and the average farm income low. All but a small percentage of these farmers have met their obligations. The 12 Banks have total capital, legal and other reserves and undivided profits aggregating more than \$80,000,000. Their total assets exceed \$1,300,000,000. The net carrying value of the real estate, sheriff's certificates and similar items owned by the 12 banks on November 30, 1929, was only 1.1% of their assets.

The services of the 12 Banks and the National Farm Loan Associations through which the loans are made have been of inestimable benefit and they will increase in the future.

Fruit Men at Harrisburg

By S. W. FLETCHER

THE seventy-first annual meeting of this time-honored organization, the State Horticultural Association of Pennsylvania, the oldest in the state except the Pennsylvania Horticultural Society at Philadelphia, was a fair index of the quiet confidence that prevails in this branch of Pennsylvania agriculture. There was neither exuberance over large profits nor pessimism over low returns, but a general feeling that the future, as the present, will yield fair returns to the man who does his work well. There is very little new planting of apples contemplated, however.

The moderate apple crop of 1929 was reflected in the Fruit Show, which was one of the smallest in years, though of higher grade than usual. It is a pity that the display value of this fine fruit should have been practically destroyed by showing it in such a crowded, dirty setting. This is in most humiliating contrast to the exhibit of the New Jersey Horticultural Society. The new Exhibition Building, it is hoped, will bring relief next year. Fruit growers should insist that it is not enough to merely show fruit; it must be attractively displayed.

Leading Winners in Show

The Sweepstakes, for the best bushel of apples, was won by M. L. Lightwood, of Fairfield, Adams county. The Gabriel Heister Cup, awarded to the exhibitor who wins the most points, went to Guy L. Hayman, North Brook, Chester county. The County Horticultural Society banner, awarded to the county winning the most premiums, was carried home by Franklin county.

The officers elected for the ensuing year are: President, J. S. Rittenhouse, Lorane; vice-president, H. S. Nolt, Columbia; secretary, R. H. Suds, State College; treasurer, C. B. Snyder, Ephrata.

The reports of the secretary and treasurer showed that the association is stronger than ever before. The paid membership for 1929 was 905, a gain of 194 during the year. Of these, 612 are members of county horticultural societies. Counties that contributed the most members to the association are: York, 95; Lancaster, 92; Erie, 60; Indiana, 52; Berks, 51; Chester-Delaware, 51; Franklin, 51. The association closed the year with a balance of \$225 in its current account and \$800 in its invested account.

Resolutions

Resolutions were adopted approving the plan of authorizing apple package manufacturers to add one cent a bushel to the market price, this money to be turned over to the "Apples for Health, Inc." for the national advertising of the apple; requesting the Pennsylvania State College to expand its research program in fruit growing, and to extend the County Spray Service; requesting the Committee on Game Laws to investigate the feasibility of laws now in force in other states (as in Massachusetts), which provide for compensating fruit growers for damage to orchards by deer; requesting the Farm Products Show Management to permit all fruit shown in closed packages which does not win premiums to remain the property of the exhibitor, instead of being sold for the benefit of the show, as at present; disapproving the proposals that the Farm Products Show be held in November instead of January, and that an admission fee be charged; authorizing the Executive Committee to consider plans for the celebration of the 75th anniversary of the organization of the association in 1934.

The banquet, on Wednesday evening, was featured by the presence of Hon. Charles S. Wilson, of Hall, New York, member of the Federal

Farm Board and a commercial fruit grower. He stated that the policy of the board, in carrying out the provisions of the Agricultural Marketing Act, was to work only through cooperatives, and preferably regional groups of cooperatives. There are 2,000 cooperatives in the Northeastern states, 200 of which are in Pennsylvania. The Federal Farm Board cannot contact with these individually; they must be affiliated into larger units.

The board has appropriated \$30,000 to make a study of the methods and problems of cooperative associations in the Northeastern states; \$3,100 of this amount has been set aside for Pennsylvania. The board recognizes, however, that any considerable regional cooperation in the marketing of farm products is likely to be a matter of slow development, in the Northeastern states, which is blessed with nearby markets, but believes that this is the road to ultimate improvement in the agricultural situation.

Four Sections Suggested

The board desires to set up an advisory committee that will fairly represent the apple industry, this committee to counsel with the board concerning marketing problems. It may be assumed that this committee would consider the desirability of establishing a national sales agency and stabilization organization for apples. The board considers representation on this Advisory Committee should be by regions, somewhat as follows:

1. The Northeastern states, including Pennsylvania and New Jersey.
2. The Cumberland-Shenandoah Region.
3. The Mississippi Valley Region.
4. The Pacific States.

The association is invited to participate in the selection of representatives of this region.

The outstanding feature of the meeting was the evidence that "no man can live unto himself alone," not even a Pennsylvania fruit grower with good local markets; his most serious competition may come from growers who live 3,000 miles away. This is why the annual meetings of the association are concerned more and more with marketing, and less with cultural problems; and why the Pennsylvania grower must keep alert on national as well as local conditions in the industry.

Fruit Propagation

I just bought a farm and I want to plant some trees. Two years ago I got more than 200 wild trees and grafted them. The apples and pears did pretty well, but the cherries and peaches died. Please let me know how to graft them. I made a bed and planted peach pits. Would like to know if they will grow the same variety of trees. T. Perry.

CHERRIES and peaches commonly are budded, not grafted. This should be done in August. Circular 103 of the Pennsylvania State College gives a full description of the method. Peaches do not "come true" from seed; the seedling trees you grow from these pits would be of a great variety of types, most of them worthless. They must be budded to a standard variety, as Elberta, in order to be useful. Usually peach seedlings are budded in August or September of the same season in which the pits were planted. If you have one or two year old peach seedlings they should be cut down to the new top budded in August; but this would not give as good trees as to raise some young seedling peaches from pits this season, and bud them in August.

If the cherry seedlings are old they may be whip grafted in April as described in the bulletin; two-year-old seedlings may be budded in July or August. S. W. F.

Truck Crops

Flooded with Salt Water

I am located in the tide water country on Del-Mar-Va Peninsula. I would like advice on peas for market. I have a plot of ground that is very rich, but this ground is flooded on a low tide, but is an extra high tide (this is salt). If peas will not grow what crop could I plant there? Also which salts do peas require? John H. Taylor.

It would be only a guess for me to try to tell you whether peas would produce on your land that is somewhat salty from occasional floodings by extremely high tides. I believe you would find the experience of others who have similar land in your neighborhood worth investigating.

Although it would not help you this year I wonder if it would be worth while as a guide to the future to plant a single row of several different crops on the land in question. That would be the best answer. G. S. W.

Onion Plants

I grow lots of plants for sale but have never handled onion plants. Now I wouldn't suppose that these would be as hardy as frost-proof cabbage. Could you advise a good and safe time to plant them? C. H. H.

ONION plants of such varieties as Prizetaker, Riverside, Sweet Spanish or others of the Bermuda or crossed types are considered to be less hardy than cabbage, but not so tender as the tomato.

I grow my own onion plants, sowing under glass early in February, so can not recommend a southern source from experience. G. S. W.

Cannery Crops

Do you recommend nitrate of soda on cannery peas? I am also going to raise tomatoes. When should nitrate be put on so the benefit will go to the fruit and not altogether to the stalk?

Could I sow sweet clover seed with the cannery peas without it being a nuisance or pest to the peas before harvest? Do you recommend alfalfa? In either case I am going to manure and lime heavily.

Do you advise growing Stark's Blight Resistant tomato as a money-maker for cannery purposes? J. F. V.

FOR cannery peas I believe you would secure better results from a complete fertilizer than from nitrate of soda alone. I would apply all of this just before planting. Without knowing your soil I would guess that two or three hundred pounds of 4-8-7 per acre would prove profitable. If you expect a good price a slightly heavier application would deserve consideration.

Tomatoes usually are fertilized with from 500 to 1,500 pounds per acre of 4-8-7 or a similar mixture on sandy soils.

I have sown sweet clover in early peas several times. If the weather turns out to be very dry you may fail to secure a stand. If very wet the clover may develop to a troublesome size, although I never have experienced this situation.

Marglobe and Greater Baltimore are popular cannery tomatoes. The safest plan will be to grow the variety favored by the cannery to which you expect to sell. G. S. W.

Heated Soil

I would like to know what can be done with ground in boxes that tomato seeds are planted in to prevent the plants being eaten off by insects and worms. Would it do any damage to the ground to heat it in an oven before the seeds are planted? S. W.

THE plan you suggest, heating in an oven, is used quite commonly to sterilize small quantities of soil to be used for growing plants in the house.

You will find that quite a little time will be required for the heat to penetrate throughout the soil and that good results will be secured more easily if the pan used is not too deep. If you "cook" the soil just enough to thoroughly cook a potato buried in the center no damage will be done. G. S. W.

This One Man and His John Deere General Purpose

The man who owns a John Deere General Purpose Tractor and its equipment plugs up a big hole in his bank account—he needs little extra help—he saves a lot of money.

In cultivating with his three-row unit he covers from 25 to 40 acres a day. He does more work in a day than can be done with four men operating single-row outfits. He keeps ahead of the weather and the weeds.

With his John Deere General Purpose three-row planter he plants from 30 to 40 acres a day. He is in position to take full advantage of good days—to the extent of putting in extra hours when necessary.

There are no levers to operate on the planter or cultivator—the power lift on the tractor does this work for him—a touch of the toe on the trip button and up come planter runners or cultivator rigs—another touch on the same button and down they go to work.

This man cultivates round after round, hour after hour without stopping his tractor. Think of the time and the labor this feature saves him every day!

What's more, he has a tractor of standard design that does all the other field and belt jobs equally well within its range of power.

Here's truly a cost reducer that is changing the farming picture for thousands of row-crop farmers.

Get This Complete Fact-Story

See your John Deere dealer and write today for booklet containing many letters from General Purpose Tractor users. Write today to John Deere, Moline, Ill., and ask for booklet GH-436

JOHN DEERE GENERAL PURPOSE TRACTOR Does All Farm Work Equally Well Within Its Power Range Including Planting and Cultivating

MECHLING'S SCALE OIL SPRAY

There are reasons for the effectiveness of
MECHLING'S
SUPERIOR
SCALE OIL SPRAY

In spraying for APHIS, RED MITE, SAN JOSE and other scale insects, you want penetration that kills... and you want economy.

Three of the most destructive orchard pests can be controlled at one time.

Mechling's Spray is made from easily penetrating oil, mixes readily with any water; will not separate to burn trees; and can be used at dilutions that bring the cost to a minimum.

Comparative tests by Experiment Stations show that Mechling's Scale Oil is superior to all others and gives perfect control.

Put Mechling's Spray to a Test
Purchase from your dealer a small quantity of Mechling's spray. Try it, read the booklet he will give you. If you are not entirely satisfied with results, your dealer will refund the purchase price.

Cultivates more acres a day than these Four Men with Four Cultivators and Eight Horses

Features on Tractor And Its Equipment

Standard conventional tractor design. Pulls 2-bottom plow with two wheels in furrow—easy to guide—no side draft.

Heavy-duty two-cylinder motor burns low priced fuel with real economy.

Take-up in every joint of steering control. Roomy platform—comfortable seat—operator can stand up or sit down.

Planter forms unit with tractor—compact—plants within 6 rows of end.

Runners operate independently—insures an even depth of planting. Doffer button releases wire at ends.

Tension meter on planter—wire stake makes a good check possible. Tractor forms unit with tractor—speed of tractor controlled to meet all conditions.

Has same flexibility as three single-row cultivators—does uniform work in uneven ground.

Depth of cultivation changed from seat of tractor.

Each rig has independent depth adjustment.

Rear shovels cultivate out the wheel tracks.

Power driven mower cuts from 25 to 35 acres a day.

Forms unit with tractor—quickly put on or taken off.

Safety lock and slip clutch prevent breakage in rough land.

Record Garden Yields

Make Big and Sure Profits

The demand for health-giving vegetables is growing; wide markets open new opportunities for quick, profitable sales. Use Isbell's

Why Have Runty, Scraggly, Money-Losing Pigs? Why Let Any Farm Animal Get Out Of Condition, Rough-Looking, Run-Down, Stunted? Why Go To All The Trouble And Work Of Catching, Dosing, Drenching, Or Handling Animals? Read Here About A Novel Home-Mixed Remedy That Guards Against These Evils Of Off-Condition. Then Use The Coupon For Liberal 30-Day Test Package.

Inexpensive Remedy

ENDS DRENCHING DOSING, HANDLING

A tested, effective tonic, conditioner, regulator and appetizer for all your livestock is mixed quickly and inexpensively right on your own place. Many veterinarians, county agents and thousands of other good, practical farmers recommend WYMIX. It is remarkably easy to feed—Your Animals Actually Doctor Themselves. WYMIX is concentrated—you don't pay drug prices for fillers—no shipping charges to pay either—so you save one-half usual cost of ready-mixed preparations. Prove these claims at our expense. Do not send money. Do not pay C. O. D. Just mail the coupon for a 30-day test package.

Nothing Else Like

WYMIX (formerly called WORMIX), cleans out and purifies the animals' stomachs and intestines. It is an unexcelled appetizer, a superior tonic, conditioner, regulator and preventive; absorbs foul intestinal gases; aids digestion. No wonder WYMIX quickly puts farm animals in sturdy, thrifty condition as nothing else does. No wonder they gain faster, stand vaccination better, get more good out of their feed.

Takes Place of Minerals

When you feed WYMIX, no other mineral mixture is needed. WYMIX is rich in minerals of highest grade and gives required balance to the grain rations you feed. A real "Two-in-One" stock necessity. Two preparations for the price of one. You keep in your pocket, the money you usually spend for minerals. Best and cheapest help to keep all farm animals in fine, thrifty condition even through the coldest winter. Make your own stock remedy and minerals with WYMIX—have a far better preparation than you can buy ready-mixed—and save half the cost.

Send No Money Pay No C. O. D.!

The coupon entitles your liberal 30-day test package. This 3-pound bag of WYMIX, mixed with 17 pounds of common salt (or ash), makes 20 pounds of the best and cheapest medicine and minerals for hogs, sheep and other stock, lasts 40 hogs, sheep, or goats, or 10 head of cattle or horses, about 30 days. Simply put it before the animals; they eat it readily and actually doctor themselves. No handling or dosing.

Why Look Further?

When you have once found Wymix, there is no use looking for a conditioner, appetizer and stock tonic.

—James C. Birtcher, Pisgah, W. Va.

Fill and Mail This Coupon
Send me prepaid a 30-day test package of Wymix. I will feed it as directed, and will report results in thirty days. If it proves what you claim, I will then send you \$1. If it doesn't, you are to cancel the package.

CLEVELAND, OHIO

What's Wrong With Your Loafing Chickens?

Poultry's worst enemies are the large round worms which infest the small intestines. Anyone can tell when these dangerous, profit-killing pests are present. They cause loss of flesh, emaciation, rough plumage, decreased egg production. Appetite is lost. Infested pullets don't grow or mature; the comb and wattles are pale and small. Chickens remain in poor condition. Worms thrive on the food intended to nourish fowls.

Damage Done By Large Round Worms

Large round worms swarm the small intestines of nearly all poultry. They are the most common—most dangerous—and do more damage than any other kinds of worms which infest chickens.

If you could see the hordes of ravenous parasites at work in the intestines of your poultry, you would be amazed and horrified at their ghastly work of destruction. You would see the filthy, slimy pests gorging themselves with your costly feed. You would see them devouring your profits.

When you realize what enormous losses large round worms cause you, you will not rest until you have rid your flock of them, and saved your birds from these life-sapping, profit-eating thieves.

TRADE MARK REG. U. S. PAT. OFF.

Expels large round worms in a few hours. It is put up in powder form. Convenient to feed in a mash. Easy to treat an entire flock at one time. NO SEPARATE DOSING. No trouble or bother catching, handling, and dosing each chicken separately. Your fowls rid themselves of large round worms with Poultry Wormix. It is your best insurance against losses from these parasites.

Money-Back Guarantee

If Poultry Wormix fails to expel the large round worms which infest the small intestines, the money paid for it will be refunded—in cash—without argument.

Send, fresh from the laboratory, prepaid upon receipt of price. One pound can, \$1—six cans \$5. Each pound worms 100 fowls.

FREE SAMPLE

I offer a sample can Poultry Wormix for 10c to cover postage and packing. Each sample treats 10 fowls. Send now while offer holds good. Prove for yourself on your own flock that here is just the kind of medicine you always hoped to find—to keep your fowls free from their worst enemies—large round worms.

Ira C. Marshall, 5-time Corn King "putting out" Chilean Nitrate on his record crop. In panel—his amazing yields of the last 5 years.

IRA C. MARSHALL of Dola, Ohio, for the fifth year in succession, is Corn King of the World. His official 1929 yield, 170.14 bu. shelled corn per acre on 10 acres, made in the face of a wet season and an early frost, nearly equals his all-time record of 176.22 bu. per acre made the year before.

"I attribute my five-year achievement to the nitrogen carrier I used in my fertilizer—Chilean Nitrate of Soda. I have used it liberally on every one of my championship crops."

IRA C. MARSHALL,
Dola, Ohio.

Farm Facts and Fancies

By ALVA AGEE

I FOUND in the market a lot of potatoes that looked good to me. The bags carried the legend "U. S. No. 1, Selected," and that "U. S. No. 1" is something that careful buyers demand. The bag stated where the potatoes were grown. That was good. It carried the name of the association. That gave confidence. I bought a bag and when it was emptied at home the number of the smallish tubers surprised me, and I thought it worth while to count and weigh.

The potatoes were put into four piles by count, and the twenty-five per cent of smallest tubers showed an average weight of three and one-fifth ounces. The next fourth of the lot had an average weight of four ounces. The third quarter averaged five and a fifth ounces, while the best quarter showed the quite satisfactory average of seven and four-fifths ounces.

Here is a case where the trouble lay with the original stock of potatoes. Technically they met specifications, it may be, but the buyer was not interested in technicalities. One infers from this bit of research, without invoking the aid of any scientific formula or plotting any curves, that grading can take small potatoes out but it can't put big potatoes in.

Going a Bit Further

Grading of fruit and vegetables has been a big step forward. The public is learning to demand grading and branding. The next step would seem to be to deny the use of the words "U. S. No. 1" to the graded product of any lot of fruit or vegetables that does not have the stuff in it to provide a number one article. I see the difficulties, but they should be overcome. This applies to many things, but for the moment we are talking about potatoes and the brand "U. S. No. 1" should not have legal use on a bag containing potatoes of which three-fourths by count average in weight four and one-fifth ounces. The shippers of this bag complied with regulations, so far as I know, and it is the regulations that are interesting me.

Liberal Use of Fertilizers

Many of us remember the day when commercial fertilizers were regarded as mere stimulants, misleading the farmer using them. There is the story of two tramps who found a quart bottle of powerful moonshine along the railway track. After the bottle had passed back and forth a number of times, one of the tramps announced that he proposed to buy that railroad, and all the railroads, and all the automobiles, and all the hotels. His companion told him it couldn't be done, and when asked why replied that he was unwilling to sell. Poor land, given a heavy application of the right kind of fertilizer, is temporarily well fed, and whatever stimulation is added is healthy. I mention the matter for a reason, and of course dragged in the story without any reason.

There has been some interest in what has been said about the practicability of lifting a poor field into the productive class without delay by a liberal application of fertilizer if physical condition is good and lime is present. The suggestion was that the cost of such an application to winter wheat often was repaid in the increase in grain, and a clover soil could be secured that would put the field in the way of being permanently good.

An Erie County, Pa., Inquiry

One subscriber asked what I meant exactly by a "complete" fertilizer in this instance, when should it be applied and when should the timothy and clover be seeded. Nobody can know what is exactly a complete fer-

tilizer for a poor soil, and yet the practical man must make a guess and go ahead if he gets anywhere. Fifteen or twenty years ago I wanted to put a fairly safe working "guess" on this point into permanent form, and carried my statement into the office of Dean Thomas F. Hunt at Penn State College, regarding him as high authority as our country had. The doctor offered no criticism and so I took the risk of putting the statement in.

Having in mind soils not sandy, my belief was that a fertilizer in which the percentage of phosphoric acid was three times as great as that of the nitrogen, and the percentage of potash twice as great, should meet needs when applied in sufficient quantity.

The suggestion was that a fertilizer containing three per cent of nitrogen, ten per cent of phosphoric acid and six per cent of potash, applied liberally, should be used at a venture on poor land that was not sandy, and that a sandy soil should have more potash, cutting down some on the phosphoric acid for ease in getting more potash in the mixture, the raw materials in that day being less rich than they now are. It was a mistake to suggest any cut in the phosphoric acid.

Another combination having the same ratios of plant food would be a 4-13-8. At the Ohio Station a 4-16-4 fertilizer gives good increases in the yields, little potash being required. If our subscriber's soil is not sandy I would suggest a trial of the 4-16-4 at the rate of 350 pounds per acre, and yet if a field is strictly poor there probably would be little available potash in it and quite probably a fertilizer in which the percentage of potash was twice as great as that of the nitrogen would do still better.

To Reduce Cost of Hay

The work of the U. S. Bureau of Agricultural Economics interests me, and the most of the time I can trail along comfortably in my thinking, but the reason it assigns for its efforts to reduce the cost of producing hay is beyond me. It says: "Steady decline in the number of hay-consuming animals on farms and replacement of draft and driving animals with automobiles and trucks in cities has resulted in a decreased demand and price for hay. This condition makes it essential that producers of market hay seek means of reducing their production costs."

What seems to be needed is reduction of the amount produced so that it will correspond with the decreased demand. If demand for anything has a fixed limit and we are producing more than is needed to meet it, it would seem that we are traveling in a circle when we seek a cure in reduction of production costs.

More About Bulls

HAVING noticed in your paper for sometime the different accounts of fatal attacks of bulls, and some with one which was loose, I feel like offering the following suggestion: Turn no bull loose. Treat him gently. The bull has a wonderful memory and if forked or clubbed he will remember your and get you sometime when you least expect it.

Keep the bull in a good strong pen where he can see everything. He will get no noisy or become unmanageable. Always bring him out on a staff, take no chances and never allow one man to go to him alone.

We keep our bulls until they are six years or older in the above way fastened with chain from nose to ceiling. In good weather they are out, fastened to a heavy railroad track. S. W. Townsend.

This is a photo of "Susie," a pure-bred Shropshire pet owned and raised by Eula Parks of Marshall county, W. Va. This sheep shears about 12 pounds of wool every year and raises one or two lambs. People of Marshall county are beginning to favor the mutton breeds over fine wool sheep.—C. B. A.

Caleb Finds a Fault Finder

By FRANK K. RICH

MR. CALEB PEASLEE, with something of the air of a man approaching the confessional, sidled into Deacon Lysander Hyne's yard and made a seat, as comfortable as possible, upon the deacon's wood pile. The deacon, adopting the shorter method, gave Caleb a greeting, cordial enough, but brief, and waited for him to begin.

"Do you figger, Lysander," Caleb began with a diffidence which he did not attempt to hide, "that I'm over my fault findin' with such of my neighbors as I mention? What I mean," he amplified, "is this: Ain't I full as apt to find somethin' good to say about a man as I am to find somethin' against him? Wouldn't you say I am?" He paused and eyed the deacon anxiously.

The deacon pondered this gravely, thumbing his upper lip.

"Well," he hesitated, "I d'know, Kellup, I really d'know what I ought to say to that, off-hand."

Caleb showed disappointment, tempered by resignation.

"I was sort of expectin' it, Hyne," he admitted, "but I let myself hope for somethin' better, even if I wa'n't justified." He heaved a sigh. "You seem to look at it about the same as my wife does," he went on.

The Search Begins

"This mornin'," he explained, "I guess I must have got up in a kind of carpin' mood; I want to think so anyway. Two or three little things went sort not to suit me and I may have mentioned 'em to my wife, 'though I don't r'member it now. And then, d'arin' the time we was eatin', somethin' brought up the matter of fault-findin'—somethin' my wife said, it was, and while I couldn't see any p'cular reason for her mentionin' it, I answered her—more to make conversation than anything else. And in doin' it I naturally cast 'round in my mind for somethin' or somebody for an illustration, 'is you might put it."

The deacon looked up quickly, nervously apprehensive.

"Who'd you pick on?" he demanded. Caleb giggled.

"It wa'n't you, Hyne," he assured him, "though I won't go so far as to say it couldn't have been. But as a matter of fact, I fetched up Henry Titus and spoke of the way he's always goin' on about that girl of his; and I gave my opinion that the girl would be all right if she was let alone, and not nagged by Henry all the time."

"My wife heard me out, and then she says: 'That's mostly so about Titus, I make no doubt. But he wa'n't the man I had in mind when I spoke,' she says. So I cast about to think

who else she c'd have been thinkin' of.

"'Mebbe,' I says, 'it might have been Reuben Vinal you meant; he finds a good deal to c'mplain of in his neighbors. If it ain't Peter's folks, it's Jed Piper; or if ain't either of them, it's likely to be some other neighbor—Gilman or Mitchell or somebody else. I've heard him carpin' about all of 'em outside a week, or a fortnight at the outside,' I says.

"She shook her head and looked 'sif she was keepin' somethin' back, and it made me wonder a mite.

Taking the Census

"Dan Herrick?" I wanted to know, but she only shook her head again. I thought sure I'd hit it that time, seein' that Herrick don't do much but pick flaws in folks, when he talks at all, and I was a mite cast down when I found it wa'n't him. But I'd got my dander started by then and I wa'n't goin' to give up. So I went on namin' over diff'rent men and she kep' on tellin' me I hadn't hit on the right one as fast as I spoke. I started way down at the far end of the village and spoke of every house in order, jest as they came, takin' every side road and not missin' a person, far's I c'd r'member; and in the end I had to own up I was bested. She hadn't give me any sign that I'd put my finger on the one that prompted her 'marks in the first place.

"O'well," she said, "whoever it is you're thinkin' of, it looks safe to say he ain't a dweller in this village, 'I any rate, for I've took every road in the village and gone over 'em house by house, namin' every voter, I'll venture to assert—every one of 'em! Ain't I?" I asked her. And she only put her hand up to her mouth, 'sif she was coverin' up a grin, b'fore she answered me.

"Have you—certain?" she said, all the time lookin' more and more knowin' and I give it another minute of thought and told her I was certain.

"Well," she says, "you think a spell longer and see if it don't come to you that you've left out one man—the likeliest one of all, sometimes to my way of thinkin'—and with that she out of the kitchen and left me with the light jest breakin' into my mind like a blaze.

"But there's this much about it," he went on resolutely. "I may be all my wife hints I am—but from now on I ain't goin' to be! When I feel another fit such as I had this mornin' creepin' over me I'm goin' to say: 'Name over your neighbors, Kellup Peaslee, and pick out the one that's prone to carp and I'll bet I'll think of this mornin's lecture and find somethin' good to say of 'em! I'll bet I will!'"

It's A Lighter Pull for Your Team

Under difficult plowing conditions, and especially in spring plowing when your team is soft, you'll appreciate the light draft of the John Deere-Syracuse No. 210 Sulky.

That light draft advantage of the No. 210 is due to its all-wheel-carried design and properly shaped bottom. Rolling landside carries rear weight on a greased bearing, eliminates dragging landside friction, prevents "nosing in" of bottom and reduces draft to the minimum. Properly shaped John Deere-Syracuse deep-chilled bottom is a further assurance of light draft and a guaranty of good work and exceptionally long life in gritty, gravelly soils.

You ride as you do good work and you have instant control of the plow by means of handy levers. Simpler, and much easier than handling a "walker," and you do uniform good work—no rises and dips in the furrows. Hitch controlled front furrow wheel keeps bottom cutting full width. Strong steel clevis has ample range of adjustment up and down and to the side. Furnished in right- and left-hand styles.

John Deere-Syracuse No. 31 Series Plow.

Investigate these John Deere-Syracuse Plows at your John Deere dealer's. Write to John Deere, Moline, Ill., for free folder describing the plow in which you are interested. Just ask for booklet HT-836

The "Walker" that's Famous for Easy Handling

John Deere-Syracuse Plows of the No. 31 series are popular for their easy handling and light draft especially where the land is rolling. Solid steel moldboard has proper shape to turn smooth, even furrows up or down hill. Deep-chilled shoe and share assure longer life in gritty soils. Adjustable handles securely brace to beam.

Box PF-2A, Oshkosh, Kansas

TWO BOOKS FREE—"Truck Crops" Manual" gives valuable planting information and "Tractor" Manual, No. 10, gives full details of the SHAW DU-ALL. A postcard brings both books.

Fused!

That Is Why KOLODUSTS Give 10 Times Surer Crop Protection

LEADING fruit growers know that Kolodusts are the most effective dusts they have ever used—continuous experience has convinced them. And today many of these same fruit growers are wanting an explanation: they ask, "What is the chemical reason for the extremely high toxic properties of Kolodusts?"

The Fusing Process

Kolodusts, of course, are *not* made by ordinary grinding and mixing—this would give only a common dust. In the patented chemical process, sulphur is fused into Bentonite. This Bentonite-Sulphur is the super-active ingredient of Kolodusts. It is so fine that it cannot be seen under a high power microscope, and is extremely toxic.

When applied to the foliage, Bentonite-Sulphur forms a sticky, gelatinous film. This gradually dries, and transforms itself into a colloid of the irreversible type. That is to say, when once dried on the foliage it is thereafter non-wettable and will not wash off.

These chemical properties of Bentonite-Sulphur give to Kolodusts a toxicity at least 10 times greater than any other known sulphur dust. Careful tests prove it! No wonder it is the choice of scientific fruit growers.

Send for complete information and samples.

FIELD FORCE PUMP CO., BOX M, ELMIRA, N. Y.

By R. P. KESTER

DURING the past ten days I have received several of the most interesting and cheering letters of my experience as a writer. Most of them were from people I have never met personally, but that is one of the reasons why I appreciate them so much. As one grows older, friendship seems to become more and more the most worthwhile object in life. I remember hearing my grandfather say as he neared eighty that nearly everything in life except friends lost their value with age.

Part of one of the letters referred to above is as follows:

"Dear Sir—Glad to read of your birthday on the 18th of January. A neighbor and myself observe the same date, including the year. I notice that Benjamin Franklin was born on the 17th, and several other notables claim the 18th as their birthday.

"I have been a constant subscriber and reader of the Stockman and Farmer for 22 years, and my father for many years before me. I recall that when I returned to the old home place upon the death of my father in 1907 to take care of my mother, she mentioned this paper to me, and enjoyed the writings of certain men. I recall that Agee, Lighty and Zinn were among the number. I have also enjoyed them. I recall hearing Mr. Agee speak at one time and just missed hearing Mr. Zinn.

"Until the merging of the two papers in 1928 I was unacquainted with your writings, but since then have enjoyed them thoroughly. I am sorry that I cannot answer some of your questions. . . .—G. L. B., Va.

This one comes from West Virginia:

"We are much pleased with your department in the Pennsylvania Farmer. Mr. W. D. Zinn was expressing his appreciation the other day. By the way, his wife died yesterday—a noble woman and the wife of a noble man. I have lived beside them for over forty years and know whereof I speak.

"There are a great many things we want you to tell us in your notes—when to plant our garden, what to plant, what kind of fertilizer to use on different crops, and when to use lime. So many writers tell us after it is too late.

"I am a general farmer and stock raiser, and have four hundred acres in my farm. We are getting along in years, but are not too old to learn. Don't forget to tell us what kind of a garden tractor you have."—E. R. D.

One of the best letters of the week comes from my old friend, E. F. Reynolds, who for several years was the Washington correspondent for the Pennsylvania Farmer when I was editor. Mr. Reynolds writes in the same interesting manner he uses in newspaper writing, and when that facility is used to write personal letters you can see how interesting they would be.

I hope to get each one of the writers answered before it would be out of date. But the number of letters, when considered in connection with my daily work, is so great that sometimes the answer is delayed longer than I like it to be.

All this may be considered by some to be beside the mark in agricultural writing, by being too personal. But for the benefit of those who have come into the Pennsylvania Farmer family since I began writing this column let me repeat what I said at

first. This space was set aside for personal use eight years ago. I wanted a corner where I could talk about things that interested me whether any one else was interested or not. As long as the present editors let me get by with it, that is what I shall continue to do.

But during those eight years I have found that many other people are interested in the same things and some of them hold the same views. Others have different views. Well, that is their right and privilege. But during the years I have been writing to and for the public I think I have increased my circle of friends many times. Egotism? Well, call it that if you like. The most critical exceptions to my writings have come from those who differ on political and social subjects, namely, taxation and prohibition. The only real loss of friends I know of is one in Lebanon county, who wrote rather scathingly to the editors because he twisted the application of a little story I told and made it apply to himself when such a thing was not intended.

But all in all, I have enjoyed it. Sometimes it is difficult to find anything to write about, as is frequently evident. But letters often help me out by suggesting things worth while. Let them continue to come.

Friendly Talks

By Edgar L. Vincent

It will not be very long now before all through the maple sugar belt of the United States the tinkle of the big drops of sap will make sweet music in the tin or galvanized buckets.

If we listen we can hear these drops say, "I am giving the best there is in me for you." And that is true. We gather up and use a small part of the sap and turn it into syrup and sugar, the sweetest, most delicious sweet in the world. And the rest pushes its way on through tree trunk and branch, out to the tips of the limbs, giving off all the way along a bit here and a bit there for wood for trunk and branch and finally for leaves through which the tree really breathes and drinks its life. And all for you and me.

Giving for you. It is the thought back of everything that goes on in nature. We cannot think of a single thing nature does from one end of the season to the other that is not embraced in those three short words, "giving for you." And nothing escapes our thought in mind: "I am doing this for somebody else." The thing is so simple and solely for our pleasure, no power to make the heart glad.

Once I tried to find a man, and whom I had business. Such a man I had! Life had somehow soiled the milk of human kindness in his heart, and left him an unhappy, as all tired man. He had set out to get around his house; they had not seen him; he was alone. But he was happy.

To be at one's best one needs incentive to work, and that incentive is most often found in a little piece of land, a good home, with a good wife to help build up the home and enjoy the good things won from the soil.

Our Changing Livestock Industry

By GEORGE F. JOHNSON

LIVESTOCK has always played an important role in Pennsylvania agriculture. William Penn impressed on his colonists from the very beginning the absolute necessity of increasing their livestock just as fast as they were able to. By 1700, only 18 years after the first settlement in the Commonwealth, some farmers were reported as having 40 to 50 head of cattle besides hogs, sheep and poultry. This development resulted in the colony becoming a leading exporter of animal products very early in its history.

This upward trend in livestock numbers carried through the eighteenth and well into the nineteenth century with only the temporary recessions that characterize a growing nation. However, after the Civil War the industry, which had served so well as the backbone of the agricultural system, encountered difficulties on the one hand and added opportunities on the other.

Competition from western producing sections in sheep, beef and swine raising and the new demand for milk, eggs and poultry arising from the phenomenal growth of population in the eastern states brought about in Pennsylvania far-reaching changes. More pronounced readjustments have taken place in livestock kept on farms within the past half century than ever occurred before in all the state's history.

Take sheep, for example. They were the first to yield to the West. Before 1850 more than 2,000,000 sheep grazed the hillsides of Pennsylvania. Forty years later the number had fallen to 1,700,000 and by 1924 had tumbled to 415,000. This wholesale exodus of sheep, due to competition and the dog menace, can be best appreciated by the fact that all the sheep in the state today just about equal the number in Washington county alone 40 years ago. There has been a slight upward trend in number of sheep on farms since 1924, however. In fact, 45 counties had more sheep on January 1, 1929, than five years before.

Beef cattle were the next to encounter the need for readjustment. The number gained after the Civil War to about 1890 when a sharp decline set in. Temporarily, the bottom was reached just before 1900, after which the number rebounded to the highest on record. Since 1905 the number has been decreasing until today it is only slightly more than half the figure of 25 years ago.

The trend away from beef cattle in some counties started more than 40 years ago as a result of shifting into dairying. Between 1844 and 1884 there was a decrease from 54,000 to 33,400 in number of beef animals on farms in Bucks, Chester,

Delaware and Montgomery counties in spite of an increase from 562,000 to 811,100 in the state total. There is no doubt but that the development of dairying in these four counties was responsible for the decrease in beef cattle.

Another interesting point is this: Since 1884 the greatest percentage decrease in number of beef cattle has occurred in such counties as Bradford, Crawford, Mercer, Somerset and Tioga, all of which might be termed as among the newer dairy counties. Lancaster is the only county in the state which shows an increase in number of beef cattle during the past 40 years.

Swine have had their "ups" and "downs" perhaps more than any other class of animals on Pennsylvania farms. The number exceeded 1,000,000 during the Civil War, decreased to 950,000 soon after the War, reached another peak about

Poultry: Number on farms in Pennsylvania, 1880-1929, as shown by federal censuses and state estimates. The number has increased more than 100 per cent since 1880.

Hay production and hay consuming farm animals expressed in units based on feed requirements, Pennsylvania, 1870-1929. Note the lack of any clear relationship between the two lines. In fact, if the decrease in number of hay consuming city animals could be taken into account, it appears very probable that the lines representing hay consuming animals would show a very much greater downward trend.

Sheep, beef cattle and horses on farms in Pennsylvania, 1870-1930, according to a moving average of annual estimates. This chart shows in an impressive way the tremendous readjustments that have taken place in the livestock industry during the past 25 years.

1890, dropped to less than 1,000,000 around 1905, climbed to over 1,200,000 around 1916 and then declined from the highest to the lowest point on record within a period of 15 years.

By taking the census figures by counties for periods centering around 1884 and 1924, local trends in swine numbers are indicated. Every county, with the exception of three, shared in the 35 per cent decrease in number of swine between 1884 and 1924, the decrease being relatively less in the principal corn producing counties in the southeastern district of the state. Fourteen counties in this district have now almost one-half of all the swine in the Commonwealth compared to any slightly more than one-third in the period centering around 1884.

Horses have added fully as much to the changing livestock picture as any other class. Forty years ago there were approximately 138,000 more horses and mules on Pennsylvania farms than today. At first thought this appears as a sweeping replacement of horses, and yet the interesting fact is this: the change in number of horses during this period has been no greater than the change in extent of farming operations. The amount of improved land in farms, if divided equally among the farm horses and mules, would have given each about 22 acres in 1924 as well as in 1884. This emphasizes the point that we have fewer horses now partly at least.

THE FARM CENSUS

SEVERAL farmers have asked us to supply sample schedules of the 1930 census of agriculture and we have done so. But the best way is to write to the Bureau of the Census, Department of Commerce, Washington, D. C., and ask for a copy of this schedule. No return postage is required and the Bureau welcomes such requests.

FARM BUTTER CONSUMPTION

THE leaders of the dairy industry who are engaged in a campaign to increase the consumption of butter are entitled to the support of all dairymen. For all are financially concerned, directly or indirectly, whether they produce butter, cheese or milk for market. Whether dairy farmers use butter or substitutes therefor is a business question, not a moral issue, and the appeal to them is very properly based on business reasons.

FROM LIFE

AN old man who owned a profitable dairy business wanted to retire and move to a distant state. A young man who understood the business wanted to buy it but lacked the necessary capital. He consulted a friend and was told that his banker knew what the business was doing and would probably lend the money. The young man had never used his bank in this way and would not believe it possible to do so but consented to see his banker about it. To his surprise the banker offered to finance the deal. The right kind of a man can usually get credit for the right kind of a business.

CHARLES J. WEBB

LAST week Charles J. Webb, one of the world's great wool merchants, died at Philadelphia. He entered that city as a poor boy and became one of its leading citizens. His first job was with a wool dealer, who found him waiting for the doors to open on the first day of his employment. His judgment of wool was of the highest order and he had the courage to back it. Some years ago we discussed with him the possibility of exchange trading in wool. He did not think it likely to be adopted because of the variations inherent in the product. He declared that in wool "each man's eye must be his market" rather than somebody's judgment as expressed in a market grade. During the

war Mr. Webb was active in trying to restore sheep to eastern lands. He was active also in Liberty Loan and other patriotic movements as well as in benevolence, for he subscribed \$12,500,000 to the Fourth Liberty Loan and on one occasion gave \$100,000 to the Salvation Army.

A TREMENDOUS EXPERIMENT

A TREMENDOUS social and economic experiment is in progress in Russia. It involves billions of dollars and many millions of people. Agriculture is a great and essential part of it as is inevitable in an agricultural nation. A part of the extensive program laid out by the Soviet government of Russia is to develop agricultural production by collective or cooperative farming in large units, these enterprises established and equipped with machinery by the government. And a part of this movement is the purchase of a vast quantity of agricultural machinery. The Amtorg Trading Corporation, an agency of the Russian government, announces the shipment of 20,125 tractors, 17,000 plows and 20,000 drills from this country. By large-scale farming with this and other machinery the government expects to expand this year's crop area to 335,000,000 acres, which is 14.2 per cent more than the crop area of 1913. Improved seeds, modern methods of cultivation and the use of commercial fertilizers are a part of the official program of production.

We cannot believe that the production of anything can be maintained anywhere without the incentive of personal gain but the Russians think it can be, and they know their country better than we do. Human nature has always defeated such movements as this production for the public and we expect it to do so in the future, regardless of the money invested or the influence used.

FIRST STABILIZATION CORPORATION

LAST week the Federal Farm Board announced that it had recognized the Grain Stabilization Corporation and would provide it with \$10,000,000 "to carry on its initial operations." This is the first stabilization corporation to be formed under the Agricultural Marketing Act. It has broad powers under that Act, since it may "prepare, purchase, handle, store, process and merchandise" the grain for the purpose of controlling the surplus or stabilizing the market. All profits accruing from its transactions, or any losses resulting therefrom, are assumed by the revolving fund, the members of the Corporation not being benefited by profits or harmed by losses. The real function of the Corporation is to speculate in grain, in this instance in wheat, for that is what any individual or organization must do if it buys, holds and sells or does any of the other things specified in the Act. One of the declared purposes of this Act is to promote the effective merchandising of agricultural commodities "by minimizing speculation." One of the results of it is a big speculation by an agency created by a federal board and financed by public funds.

The corporation was said to have bought considerable wheat last week, but at this writing no statement of the extent of its transactions has been made. Being a public institution the public is entitled to know about its operations. At best it is bound to create new uncertainties in the grain trade, but these should be kept to the minimum by the prompt publication of all its transactions.

A WHEAT QUESTION

THIS question comes to us: "Why should wheat prices go down when this country's production and the world's production last year were less than in 1928?" There are

several influences back of the decline in wheat prices but nobody knows just how much any one of them has had to do with it. Supplies at the beginning of the current crop year (July 1st, 1929) were liberal. The carry-over was known to be large, but it was not all in sight and the invisible part of it was larger than expected. The foreign demand was disappointing. European countries have been trying to increase wheat production and they had a pretty good crop last year, which they resolved to make go as far as possible. By limiting imports as in Italy, by increasing flour extraction as in France, by economies as in all countries, they have gone along thus far without buying large quantities on this continent. Germany has paid a bounty on wheat exported to Britain, and even Russia has dug up a little wheat for the British market for the first time since the great war. What effect certain movements in Canada and this country have had on the European buying cannot be told. But it is probable that the Canadian pool's holding policy and this country's legislation have been construed by European people as an attempt to put an artificial price on their bread. In addition to all of these influences there is another which can hardly be expressed—the disposition of all prices following such derangement as war to settle back to what is commonly but wrongly called a "normal" basis. The future is more uncertain than usual because it is complicated by interference with the natural movement of the commodity both in Canada and this country, and with stimulation of production and measures of economy in Europe.

NOT UNANIMOUS

UNDER date of February 9 the officers or legislative committees of the following organizations addressed a communication to the members of the United States Senate: The American Farm Bureau Federation, the Farmers' Educational and Cooperative Union of America, the National Cooperative Milk Producers' Association, the American Cotton Growers' Association, and the American National Livestock Association, and other organizations either members or subsidiaries of the above. The purpose of this communication was to call to the attention of the Senate and the country the defeat of higher tariff rates on sugar, blackstrap molasses, casein, hides, fats and oils; and to give the impression that farmers are in favor of the higher duties proposed on these commodities. Does this communication properly represent the ideas of farmers about these tariff rates? We doubt it in three of the cases named in the memorial.

We believe that most farmers are not in favor of a higher tariff on sugar, as they produce none and cannot see the wisdom of taxing all farmers and all consumers for the advantage of a comparatively small number. We believe that farmers are divided as to a higher tariff on blackstrap molasses. Many who are feed buyers are squarely opposed to it; many who are corn growers are in favor of it. Nobody knows which group is the larger.

We believe that most farmers are not in favor of a tariff on hides since it must be accompanied by tariffs on leather, harness, belting, shoes and other products of leather. These farmers believe that they can lose more as buyers of these products than they can gain as sellers of hides.

We may be right or wrong in our conception of the opinions of farmers. So may the committees and officers of farm organizations protesting to the Senate. We leave it to the crowd, which has never been polled on these three things. With the expressions of the others we believe farmers to be in accord.

New Jersey Farm Comment

By G. W. HARRIS

LAST Friday I attended an annual dairy banquet in Newton with 250 dairymen and wives who were members of Sussex county cow-testing associations. It was a hungry group that entered the dining room of the well-known Cochran House, famous for its good meals, but that hunger soon subsided and with Professor Birnes leading the singing smiles and good cheer were abundant.

This enthusiastic meeting reflected a year of successful herd improvement work in the county. Joseph C. Jones and George R. Kennedy, testers in the two associations, reported the high herd for the year in Association No. 1 was owned by G. S. Katzenstein. The average production for the herd was 10,410 pounds of milk and 353.9 pounds of butterfat, while the average for that association was 8,549 pounds of milk and 294.9 pounds of butterfat.

The leader in Association No. 2 was Stanley Roberts with an average herd production of 12,331 pounds of milk and 429 pounds of butterfat. The average for that association was 8,947 pounds of milk and 309 pounds of butterfat.

"If all the cows in New Jersey produced as well as the cows in Sussex county cow-testing associations it would take only 51 per cent of the present cattle to produce the same amount of milk in the state," J. J. Perry, extension dairyman in New Jersey, told the members.

E. M. Flitts, who is in charge of dairy extension work in Pennsylvania, said that cow-testing associations are fact-finding organizations, and that accurate information in studying the economics of the dairy business is necessary for progress.

In discussing the prospects for dairying in the future, he pointed out that the price of milk is influenced by surplus butter on the market and that the present surplus is due to less consumption of butter during the past year. The fact that less butter is being eaten has been laid at the door of unemployment, and although the decrease in consumption per person is small, the total amount is of great importance to the industry.

What is the relation of "oleo" to the dairy business? Although much blame for the butter surplus has been placed on increasing amounts of "oleo" being used, this is not entirely true. Increase in consumption of oleomargarine in 1929 was not comparable to normal increases in past years. That under the present conditions we cannot export dairy products and that we must meet changing conditions from a domestic standpoint, was explained by Mr. Flitts. High prices for dairy cattle during recent years stimulated the raising of more animals until the 1930 prospects show an increase over the past year of three per cent of dairy cows and six per cent of dairy calves.

During the 1920 to 1930 period production per cow in the United States increased 1,000 pounds. Judging from this rate of increase in milk production there will be no need for an increase in the number of dairy cows to care for the demands of the population.

Mr. Flitts also spoke of efficient production from the standpoint of roughage grown on the farm. "The cows which return no profit from a ton of roughage must be eliminated," he said. Also "we must figure on the crops which on an acre basis can feed to the herd will produce the most quarts milk."

CLASS of 94 graduates in the twelve-weeks short courses in agriculture at Rutgers University returned home last Friday to put into practice the better methods which they had learned in their dairy, fruit, vegetable and poultry studies. The fact that this was the largest graduating class since 1923 and that an increase of 86 per cent over the enrollment of last year is encouraging, for it means that agriculture is looking upward.

These practical courses are outlined to meet the needs of farm boys and girls who cannot spend time and money for two and four-year college training. Of the students this winter 75 per cent had five or more years of farm experience and at least three years of high school education, while the average age of the group was 19 years.

It is natural that most of these students are drawn from New Jersey farms, yet the short courses attract men from other states and countries. There were three German students enrolled, one from Mexico and one from British West

Karl Otto Pfau, who left Germany one year ago, was honor man in the course in dairy farming. Otto is a graduate of an agricultural school in Germany and has had several years' experience on a German livestock farm.

Ernest Fetzner, another German student who for the past year has been working on a poultry farm near New Hope, Pa., took honors in the poultry course. He is also a graduate of a German agricultural school and has had seven years' experience in poultry work.

Other honor men were Frederick G. Manwaring, Wyckoff, N. J., in dairy manufactures; Joseph W. Doremus, Towaco, N. J., in fruit growing; and Edward Noller, Freehold, N. J., in vegetable gardening.

F. G. Manwaring is a chemist and took this short course in dairy manufactures to aid him in some research work on dairy products. Mr. Man-

Mushing On

waring's son graduated from the College of Agriculture in 1922.

The W. C. Thompson cup, awarded to the best poultryman, was won by Howell Samuel Brown, Purcellville, Va. The Komow trophy for the best fruit grower was awarded to James Leach Laws, Park Ridge, N. J., and the John W. Bartlett trophy, given to the premier showman of dairy cattle, to Israel David Phillips, Lambertville, N. J. Wallace W. Apgar, East Orange, N. J., received a set of books on Dairy Farming presented by Director F. G. Helyar to the student in dairy farming for the best report on assigned problem.

Several other cattle fitting and showmanship awards were presented, all going to New Jersey boys.

Augustin Serment of Mexico took his second short course at Rutgers this winter. Last year he selected the course in dairy farming and this winter he took dairy manufactures. Serment plans to return to Mexico where his father owns a large ranch and develop a dairy to produce high quality milk.

At the annual banquet of the E. B. Voorhees Agricultural Society, an organization of short course graduates, on Thursday evening officers for the coming year were elected. These are: President, J. Paul Jennings; vice-president, Clarence M. Allen, Flemington; recording secretary, H. Malcolm Adams, New Brunswick; corresponding secretary, F. G. Manwaring, Wyckoff, and treasurer, Carl Maple.

BEGINNING on February 17 twenty students will spend a week of practical work in a milk testing course at the College. Following this, beginning on February 24, is another one-week course in flower gardening. Flower and garden clubs have reacted very favorably toward this course

and already between 75 and 80 men and women have enrolled. During that same period a course in turf management, outlined for golf greenkeepers and estate managers, will be given to a class of 40. Fifteen students have signed up for the two-weeks course in ice cream making which opens on February 24. Professor Frank G. Helyar, director of short courses, is very much pleased with the increasing enrollment in short courses at Rutgers and believes that it is a sure sign of better agricultural conditions.

WARFARE on New Jersey mosquitoes, new and effective methods of control, were discussed at Atlantic City during a recent meeting of the New Jersey Mosquito Extermination Association.

Among the late methods mentioned was a new larvacide which will kill the larvae and pupae of mosquitoes without injuring the vegetation, fish or water. The petroleum oils used in the past have often been objectionable because of their toxic effect on vegetation, fish and water fowl.

Extermination of the salt marsh mosquitoes is one of the big problems in New Jersey. Since this work first started in 1900 nearly 5,800 miles of salt marsh ditches have been dug by mosquito fighters.

Delaware Notes

ACCORDING to W. T. Derrickson, director of the State Bureau of Markets, the total acreage devoted to farm crops in Delaware in 1929 was 3,000 less than in 1928, but the value of the crops produced in 1929 was \$16,485,000 as compared with \$15,150,000 in 1928. Corn led in total value, with wheat second. The same acreage of white potatoes (7,000) as in 1928 produced 112,000 bushels less in 1929, but the value of the 1929 crop was almost double that of the year before as the 1929 farm price averaged \$1.60 per bushel against 75c per bushel in 1928. Sweet potatoes showed an almost comparable increase in value, with an increase in acreage also. Tomatoes, sugar corn, peaches, grapes, strawberries, cantaloupes, watermelons and asparagus all showed a gain either in production or value, while apples declined in 1929. Soy beans gave a lower yield but better return.

GOVERNOR BUCK has given his hearty approval to the recent move on the part of the Federal Farm Board to conduct a survey of all cooperative units in Delaware, along with eleven other northeastern states. He has asked the Department of Agriculture and the University of Delaware to assist the Federal Farm Board in every way possible.

SPEAKING from Washington, D. C., over the National Broadcasting system recently, Dean Charles A. McCue, of the School of Agriculture, University of Delaware, described agriculture as a complexity of many industries "that may or may not have very much in common except the soil." And as for farm relief, he declared that what is good for one group of farmers may be injurious to another. "When the Federal Farm Board seeks to put the California grape grower on his feet, it deals the grape growers of my state a blow in their solar plexus. Putting the hog grower of the Corn Belt upon his feet may mean driving the swine industry in other regions into the doldrums." He also held that the slothful, the ignorant and non-progressive farmer is being pushed to the wall. "We want our inefficient in agriculture to find their useful niche in industry," he suggested. "We need an infiltration of mechanical industry into our agricultural communities. The industry called agriculture needs more consumers, not more competitors. It needs not more land under the plow, but less land; not more farmers, but better farmers; not more bushels of crops, but more efficiently produced bushels of crops."

INCREASED acreage of sweet clover in Kent county, Del., is due to the steadily increasing use of this legume for a cover crop in the extensive apple and peach orchards of the county, according to County Agent Russell E. Wilson. Originally it was introduced as a pasture crop. Mr. Wilson also reports a steady increase in alfalfa. R. B. T.

These piles of long sticks were cut for wood. They are from the crooked, short-stemmed, unsound trees. This is the proper way to prepare wood today unless cutting has been contracted, when it may be necessary to cut to one length and cord the pieces.

How's Your Woodpile?

By C. R. ANDERSON

PENNSYLVANIA'S earliest settlers at Marcus Hook and Upland on the Delaware River used wood to cook their meals and warm their log huts. For years and years wood was the only fuel known and used within the state. Great piles of it were needed. All winter long—and every winter—farm wagon and sled drew great loads to the farm home, to the homes and places of business of the nearby villages and towns. A threatened wood famine was just as serious as a food famine.

The Penns were taking a long look ahead when they specified in their early deeds of land to the new settlers that the latter must keep one acre in every five of the land they received in timber forever. Without any question they were thinking a large part about fuel.

Wood has continued to be an important fuel all down the twenty-five decades of Pennsylvania history. Even in the last half century in spite of hard coal, soft coal, natural gas, artificial gas, oil and electricity it has continued in heavy use. At the present time, not far short of one million four-foot cords are burned annually within the state. It may go even higher than that—no one knows exactly.

Now a million cords of wood is "some pile of wood." The average farm lad of the wood-burning counties of the state will bear me out on that. There's all that stuff to fall, and cut up, and haul, and split, and stack. By the time the year's supply is prepared, by Christmas perhaps, or a little later, he begins to hate the sight of a stick of wood, and to wish dad would get something else to burn.

Why are so many still burning wood? Or rather, what are the conditions which encourage many to continue its use? One thing is its relative cheapness. It cannot hold its own in use where natural gas is abundant and consequently low in price. Neither can it do so in counties where there are one or more open soft coal banks in every community, at which coal can be purchased at a very low price—very little above the cost of mining.

The Bradford county farmer visiting Indiana or Armstrong counties looks in vain for the filled wood house or the large stack of wood so familiar to him. He and his neighbors of the North Tier, just those who live within his county cut and burn nearly 70,000 cords of wood per year, while Indiana and Armstrong counties combined do not cut and burn over 500 cords each year. They have the soft coal; Bradford does not. Her people find it cheaper to cut and burn wood—which they own for the most part—in their own woodlots—rather than to buy coal.

Custom plays a part in its continued use. Many women who have cooked with wood all their lives dislike exceedingly to start over again, learning how to use any other fuel.

There is no denying the fact that wood makes a pleasing fuel. In the hot days of summer, the farmer's wife lets the kitchen fire go out as soon as she has enough hot water to wash her dinner dishes. The stove cools off quickly after the wood fire is out. A little paper, some small pieces of dry wood for kindling, a few larger dry sticks to give it a good start, and the stove is all ready to cook supper.

There was a time when the more common practice in preparing firewood was to cut the material to approximately a four-foot length in the woods. But with the increasing use of the buzz saw, it is now somewhat unusual to find a Pennsylvania farmer who follows the old time plan. Today the pieces are left just as long as they can be handled conveniently in hauling and placing on the saw frame. The hand labor is being reduced to just the lowest point possible and the machine labor increased, which is nothing if not common sense. Wood should be prepared well in advance of the

time when needed. There's a reason. Green wood carries a great deal of water. When we burn green wood, part of the heat generated is not available at all for cooking or heating, but is used in driving out the water held within the green wood. If we let the wood remain out of doors where the sun and the wind can pull this moisture out of it, we then have available for our use that heat which would otherwise be used in getting rid of the water. Three to six months drying is usually sufficient to bring the wood to an "air-dry" condition.

How to Dry Wood

A word might be said at this point about hastening drying in case we run out of dry wood. Wood will dry most rapidly if split fairly fine and then piled loosely, clear of the ground, crib fashion, first a layer one way, then a layer the other way to a height low enough that the pile will not topple over. Keep in mind that the sun and the wind do the drying job for us, and that we want to place each stick so that these two can exert their greatest influence on the sticks. I can hear some one say, "That's a lot of trouble, and it will take a lot of room to spread out a little wood." Yes,

One hundred and twenty-five thousand farmers in Pennsylvania burn some wood for fuel. They cut, and use, or sell about one million standard cords each year.

but it may be preferable to the alternate of drying green wood in the oven of the kitchen stove, as I have seen done many times. Wood will dry faster out of doors than piled within the wood house. But if the house is fairly well ventilated, and the wood is not ranked too solid, it will come to an air dry condition.

Poor ventilation of the wood house favors the development and spread of wood-destroying fungi; but these can be ignored commonly, since wood is seldom carried longer than just the second year after cutting. There appears no good reason for any farmer cutting and storing wood two years or more ahead of his needs.

Is there anything wrong with storing wood out of doors? Only that the product takes on moisture again in times of rain or snow. There should be a

small supply, at least, under roof. The average mixture of kinds of wood which the farmer gets in clearing up the tops from a lumbering job, or in doing a piece of thinning work, makes a fairly good run of fuel. Occasionally, to be sure, there will be kinds in the pile whose heat values are low, but such material will not commonly form a large percentage. But that raises the whole question as to what are the fuel values of the various kinds of wood.

The weight of the air-dry wood is an excellent indication of the heat units it will produce on burning. This holds very, very closely for the hardwood or broadleaf trees. The North Tier farmer knows that his beech, birch and maple make good firewood, and if he doesn't know that the trembling aspen and basswood are low in heat value his wife will make it known to him if he provides no other fuel when she finds she has to feed the stove so heavily with wood that she can get little else done in the kitchen.

When it comes to a consideration of the coniferous trees, we find air-dry weight is not as close an indicator of heat value. Many of these are resinous, some so strongly that we speak of them as "pitchy." The resin yields far more heat for its weight than the usual wood structure.

Black or yellow locust has the highest fuel value of all our Pennsylvania woods. It is followed closely by hickory and white oak among trees which grow to large sizes, and by dogwood, hornbeam and service berry among those of smaller sizes. The poorest of all are basswood, aspen, loblolly, yellow poplar, white pine and hemlock. None of the other oaks is equal to white oak in heat value. Of the trees of the beech, birch and maple forest of our northern counties, the black birch stands the highest, very close to white oak; white ash is almost as high; beech and yellow birch have the relative position, a little way below these other two; and red maple and wild black cherry are close together, having only about eighty per cent of the value of black birch, or about seventy per cent of black locust. It will surprise some to know that red maple is as high in fuel value as sugar maple.

By far the greater part of the firewood burned within the state is used in kitchen ranges. For this purpose it is split into pieces which contain as much material as the average one to two-inch half inch round stick. The farmer who pursues the sensible course lays back the rough knotty pieces which are difficult to split to use in the furnace or for use in the fireplace wood. The latter has grown greatly in demand during the past ten years. There are towns within the state where it is well-nigh unobtainable. And what is to be done? The answer is, be patient and open your place with its burning logs. We enjoy it just as much as the early Pennsylvania settlers of ours enjoyed it, and a half century ago Edgar A. Guest wrote words truly descriptive when he said in his poem entitled "A Log Fire":

"You may boast a wood fire's splendor, and say you're a fancy dresser; And I'll grant an open fireplace is as cozy as it can be; And I'll grant the spit and crackle of the wood music sweet; As you watch the sparks come flying from the round your feet."

In some woodlots numerous trees should be moved for the good of the woodlot. To give the remaining trees a better chance to make a crop. What more fitting end for them than to add cheer to the romantic atmosphere of the fireplace or power to the essential cook stove. And the fact that the hardest labor of woodcutting may now be done by machinery detracts no measure from the joys of the ancient wood occupation of cutting wood.

A Thinking Job

By Fisher Ames

Copyright, 1929, by Copper-Harman-Steele Company

"FAIR! Well, I reckon you'd say any warnin' was fair to that—" and King delivered another string of blasphemous epithets. "We-all 'll make our own law an' order round yere without any hound-like that Tittle pesterin' us."

King staggered out to the end of the pier to see Toots off. He was quite affectionate at parting and tried to throw his arm around Toots' shoulder, but the latter stooped to slip the sharpie's hawser and King almost fell overboard.

"You're a nice young feller," he said, recovering his balance. "The boys don't like new faces round yere, but I say you're a nice young feller. I'm gonna give you a tip. Don't go a strollin' over these yere flats no matter what for. The boys are mighty techy an' sorter apt to use a rifle bullet as a no-trespassin' sign. See. I'm a-tellin' you cos you're a nice young feller."

"You're all nice fellows, too," said Toots. "A fine lot, I reckon."

"Well, that's so. They don't make 'em much finer, but it don't do to go pesterin' us."

The interview with King put another black mark in Toots' book against oystering. Toots held the typical laborer's view of the law. It was clumsy, slow, often partial, he thought, but it was to the advantage of everyone to keep to the letter of it, and its officers were men to be obeyed and, in the main, respected. That King and his friends should make a coffin for the warden and write him a letter concerning it, even as a joke, did not seem humorous to Toots. Without proper law and order and an official whose power to enforce it was unequivocally accepted there was a poor outlook in this tide-water section for a small lone investor like himself.

So far as the actual work went Toots found the life vigorous and varied, satisfying to his craving for activity in the open air, until he was called upon to do night-tonging. That was more than he had bargained for, and when, after supper one evening, he was brusquely requested to get into his slicker, he felt rebelliously.

The men, finding him habitually quiet and amenable, had set Toots down as rather a blank so far as character was concerned, "a two-spot," as they phrased it. They knew he was a waif from another part of the state and that he had lost his job at Tigert's. The fleet had a good many young incompetents, or worse, who had drifted into the life because of its moral and legal laxity. The specially close-mouthed ones, like Toots, were suspected of having something in their past which they were particularly anxious not to reveal. Hence Bartlett's manner toward Toots had grown more and more domineering.

"Git a move on ye," he said in his most bullying tone. "Spect you're goin' to spend every night a-snozin'."

Toots put on his hip-boots and slicker in silence. The three of them left Eden tossing fretfully on his bunk, and stumping through the greasy marsh glass embarked in the long-boat, each pulling a pair of long but light ash sweeps. One of the big bateaux, attached to the stern by a tow-rope, followed them sluggishly.

CRUMB set a rag of a sail presently and they sailed on their oars while the wind wafted them down the narrow end of the bay and up a creek between two blocks of yellowish marsh. Emerging from this another wide body of water faced them. Crumb lay south by southwest, and Crumb laid the oars in that direction. The surrounding marshes were too low to be feasible as watch-house stations. The nearest shanty was a couple of miles distant, its light twinkling like a feeble little star. The main fleet lay off to the eastward, marked by a group of riding-lights that were beginning to be dimmed by the mist rising from the water.

The tide was dead out when Crumb lowered the sail and they floated at rest alongside a high flat like a mass of cheesy dough, down whose banks trickling streamlets of belated water made sibilant noises. It was an old bed, thickly strewn with shells, many of them primes, and the long handled tongs were unnecessary. They gathered the oysters with gloved hands, culling as they went, each man packing his own big wicker basket to the bateau, moored close to the bank. It was not so hard as the ordinary day-time stint, but Toots worked with a chip on his shoulder. He almost started up when Bartlett requested him to dump his shells more quietly.

A moment later Bartlett said, "We-all uv' been in hard luck lately an' got to hustle. If the rest of the boys knew we was night-tongin' they'd git jealous an' pitch in too, an' then the market 'ud go bloomy."

Mark never spoke at all, even when addressed. He worked in a mechanical way, as though mesmerized, and occasionally stopped and stared down at the mud in a kind of trance, from which he would awaken with a start. Apparently he would have gone on gathering shells and dumping

them on the heap in the bateau all night, regardless of whether the boat could hold them or not, but when Bartlett announced a full load he silently took his place at the oars.

He did not join in the low-voiced conversation between Bartlett and Eden when they had returned to the shack, but took his Bible to the table and began to read. When Toots' sleepy eyes refused to stay open any longer Mark was still sitting hunched-up over his book.

Work next day was light and Toots had a foreboding that this was not so much due to what had been as to what was to come. Sure enough, after supper Bartlett began to hunt for his boots and slicker. At that Mark raised his head and spoke, and his voice was oddly hollow.

"Not tonight, boys," he remonstrated. Both Eden and Bartlett pitched into him verbally with a violence that surprised Toots. Eden thumped his pillows in a fury, declaring that the whole business was at stake, and they all might as well get out of it now for good if his brother refused to put his shoulder to the wheel. In the end they beat down Mark's resistance and with an unhappy air he pulled on his outside garments.

To ask any questions would, Toots knew, be simply a waste of breath. He felt there was something back of this night's work other than the reasons given in his presence by Eden and Bartlett. He believed Bartlett was lying when he said a lot of others might compete with them if they advertised what they were doing. The idea of wholesale rivalry was nonsense and didn't account for these secret, soft-footed methods.

Toots ruminated over these points as he trudged about the flat, mechanically culling the shells. Once he thought he heard a sound out on the water and pausing to look, saw Bartlett arrested in a pose of attention, his hand cupped to his ear, peering into the mist-laden darkness. The

The Cheerful Plowman

"PIG! PIG! PIG!"

NO pig of real and royal blood should have to live in dirt and mud like pigs of old. I say; back in the crude unlettered times when people talked in cents and dimes, in nickels, day by day, then people felt that every hog should wallow in the mire and box, in slush up to his neck.

"That slush is great for growing swine, to them it's like the best of wine," my grandfather said, "My Heck!" My Uncle Remus Flint-ridge Squire was sure that pigs would thrive in mire, in cold and oozy slop; said he, "That makes them sturdy boys, not dainty pigs like woolly tows, it makes them full of hop!" It builds their gizzards and their lumps, it makes them strong in legs and tongues, it makes them rugged lads; the pork from pigs that waded around in spongy, wet and chilly ground is best—so said our dads."

That stuff's bunk, it's out of date, he was a poor untutored skate who pushed ideas like that; he did not know his pigs and swine; he could not tend these hogs of mine, he testified through his hat.

My pigs have clean and airy stalls with white and clean and finished walls; they do not wade in junk, they do not chill on rainy days, and wallow in a torpid haze with joints all stiff and bunk! They're clean as school-boys all the time, they are not coated thick with grime, they are not caked with mud; they keep that school-girl look as such, they have the skin you love to touch, they show their royal blood.

That old time guff of health in dirt, of strength in filth, I must assert, was twaddle, nothing more; good sanitation for a pig counts just as much and just as big as for a king or corps!

J. E. T.

sound was not repeated. Probably a leaping fish had caused it. Bartlett soon went to work again, but Toots knew that the fellow had received a scare, and decided that he would find out once and for all what the real reason was. Things had reached a point now where they had to show him. He suddenly struck up a song at the top of his clear, carrying voice:

"Whar de moon am shinin' low
An' de whippoor-will's a callin',
Down among de shugar-cane."
An oyster shell whizzed viciously by his head. Oblivious, he began the

next stanza:

"Dar's whar my girl's a-waitin',
An' her eyes am soft wid love
Fo'—"

A flock of shells that were not soft splashed into the mud, accompanied by the spitting of running feet as Bartlett and Crumb came toward him. Toots took the offensive instantly.

"What's the matter with you, chucking things at me that way?" he said, lifting his voice.

"Shut up! Close your trap!" Bartlett hissed furiously. "What d'you think this is, an op'ry house?"

He glanced about apprehensively. Crumb walked up to Toots until the latter was forced to take a backward step. "If you want a bash over the head keep on with that racket," he said in a strange voice. And suddenly his right arm curved over in a powerful sweep that knocked Toots' hat spinning as Toots ducked just in time to escape the hard bunch of clenched knuckles.

Bartlett closed in on his other side. It began to look as if he were in for a rough time, but thanks to Jack Rose he would not prove such easy picking as they expected. He retreated quickly, squaring off, his gaze watchful.

"If everything's all right what are you afraid of a little noise for?" he demanded.

The two were saved the trouble of answering this by an interruption from an unexpected quarter. A shout came over the water, carrying even to Toots' ears a threat in its querulous rasp. Crumb and Bartlett turned with guilty abruptness and darted toward the point where their boat was moored. Toots saw the whole game now. They had been poaching; the bed did not belong to the Crumbs.

HE was innocent of intention, but the owners of the bed would not believe he was not as red-handed as his companions, and he had learned from others beside King that, if caught, it was quite within bounds that he would be knocked on the head with an oar-butt and chucked into the channel. Instinctively he fled in the direction of the long-boat.

The two men made no hostile gesture as he tumbled aboard. Undoubtedly they were glad of the extra pair of oars. Crumb moved aside to let him pass to the bow seat and they got under way, coming up with a jerk the next instant as the tow-rope taunted. A slash of Bartlett's knife and they were free of the bateau, which was left to drift off with the tide.

The advantage was with them in that the other boat was on the opposite side of the flat. Crumb appeared to be in a trance again, but he pulled a powerful oar. As soon as they were in the swing of the current Bartlett produced a handful of rags and muffled the oar-locks, giving the directions for their course meanwhile: "Through Brant Gut, west Five Point Shoal there'll be flood enough now an' round by Old Creek."

From the other side of the flat came a series of loud, widely-spaced explosions that choked down to a blurred, rapid thud-that-thud. Their pursuers had discarded their oars and started the engines of their motor-boat. Toots felt the long-boat quiver as Crumb and Bartlett threw more vigor into their stroke. He caught the pace and with the three pairs of blades thrusting in perfect unison they swept down with the tide. They rounded the corner of the flat with the agile swirl of a shark. The blood began to thrum in Toots' head. A rising wind cut along under the low clouds obscuring the sky, whistling mournfully through the bending sedge and raising murmuring ridges on the water. There was excitement in the griminess of the game. Whatever the outcome Toots was through with the business for good, and his mood fell in responsively with the dramatic setting of this, the final scene.

The motor-boat cut a swift arc around the flat like a hound snuffing hot on a trail. With uncanny intelligence it chose the channel leading to Brant Gut. Bartlett began to whine through his clenched teeth, cursing his luck and the men he had robbed in a sing-song undertone, like an impenitent but frightened boy when he is being punished for some meanness. One thing fell out in their favor, slight though it was, and that was the caution with which the motor-boat advanced as soon as it was in the gut, with occasional pauses to examine the pockets in the marshy walls.

(To be continued.)

The Farm Home

More About Birds

By HEPSY NEFF

MIGRATING birds are now returning to sections which gave them a warm welcome last year. Our clean fence rows may give us a sense of pride and skill but the ragged hedges and brush which we grubbed out or cut back may send birds like brown thrashers, juncos and wrens to the fields of our less tidy neighbors. With the first warm days of spring moths and every sort of flying insects begin to crawl out of winter quarters and never is the help of our keen-eyed, swift winged friends more timely and effective.

The zero temperatures of the winter just passing have taken large toll of insect life and the first comers will be less vigorous than usual. Under such conditions any friendly advance we can make toward our bird friends will give large returns. A life-long bird lover suggests bringing stems of shrubs together about four feet from the ground and binding them tightly with a bit of wire or strong cord, thus making a foundation for a nest and yet concealing it by the leafy foliage still reaching several feet above it.

Twice have I tried this experiment, once in a lilac bush and once in a bush honeysuckle and the sharp "tseep, tseep" coming from somewhere later, kept me guessing a long time before I found the brown thrasher's nest I had made possible.

Later snow falls will still bring the need of help for such early friends as robins, wrens, bluebirds and whitethroats. Feeding any birds soon means feeding English sparrows and our song birds will not stay anywhere long where these pests are plentiful. The bluejay is another enemy of song birds but the "worst enemy, in some sections, is squirrels. During a recent heavy snowfall of ten days I fed a large number of birds including English sparrows and they all ate together freely until a gray squirrel came to my table and took possession. The day after his coming every bird disappeared, even the English sparrows, but only the squirrel of feed took him away.

I have seen a pair of bluejays dart, screaming, toward a squirrel that came near the tree in which I had built a nest, literally driving the squirrel out of the ground. I have also seen a robin kill a newly hatched young, torn to bits, and the nestlings killed and the only possible explanation I had as to the murders was a pair of squirrels. After these experiences I am ready to accept without question the statement of a life-long bird lover who keeps a standing offer of a bounty for the head of any cat, weasel or polecat who kills a bird or squirrel found on his ground.

He says: "We can only attract birds permanently as we are able to protect them from harm. Even the increase of English sparrows always means the decrease of all other birds." We may have the best of conditions for attracting birds and having their help against the insect pests in our gardens and orchards, but if we want this help we must work for it. A list of farm bulletins will show a surprising amount of up-to-date information waiting for our requests and a postal card will bring them. Write to our Department of Agriculture, Washington, D. C., and ask for the bulletins you want by name or number.

Appetizing Dishes for Cold Days

GOLASH:—In the bottom of baking dish, place a layer of sliced uncooked potatoes, then a layer of raw sliced onions, next a layer of cooked rice and lastly a layer of one pound ground round steak. Over all pour one quart of canned tomatoes. Season each layer with salt, pepper and dot well with little cuts of butter.

The depth of each layer may be varied to suit

family likes. We are three grown-ups and three children and with one pound of meat I use inch layers of the other ingredients. By using two medium sized baking pans, you can make enough for one bowl next day. It is good as new when warmed over.

Spanish rice:—One pound hamburger, two cups tomatoes, two small onions chopped, two cups cooked rice, one teaspoon salt, pepper. Thoroughly mix all the ingredients and bake in hot oven for one hour. If your tomatoes are quite juicy, no further liquid is necessary.

With either of these two recipes a green salad, bread and butter, milk to drink, and a simple dessert may be used to furnish a balanced meal that is economic and easy to prepare.

Mrs. C. C. Garey.

Shoulder and Under Arm Balance

A DRESS that does not hang properly from the shoulders never looks well. On rather stout or on round-shouldered figures alterations sometimes have to be made in a foundation pattern before the material is cut. The illustration shows how this may affect the shape and size of the armhole unless special attention is given to it.

In illustration A the back was raised at the shoulder seam so that the shoulder line

A—Method of balancing a foundation pattern by taking a tuck in the front and slashing back.

B—Method of balancing dress at shoulder and underarm seam without altering size of armhole.

was kept in the original position while the dress was balanced at the underarm seam. The extra goods at the bottom of the armseye were trimmed out as shown by the dotted line and the size of the armseye remained unaltered. This change can be made after the material is cut, but all changes are best on a foundation pattern which then serves for future uses.

As the changes in illustration B necessitate cutting, they can be made only on a foundation pattern. A dart which has been taken in the front is equalized by cutting and separating the parts of the pattern in the back. These changes do not alter the size of the armhole. If the armseye is altered the sleeve will have to be altered an equal amount in order to keep the same relation between the edge of the sleeve of the armseye.

Detailed suggestions, with many illustrations, on fitting dresses and blouses, may be obtained by writing to the Bureau of Home Economics of the U. S. Department of Agriculture, which has prepared a helpful bulletin on the subject, No. 1530-P. It is free while the supply lasts.

Careless preparation of vegetables, especially over-cooking, is often responsible for the unappetizing results that find their way to many tables.

Plenty of vegetables in the diet are better for the family than tonics, for flagging appetites. Try serving one vegetable dinner a week and at least one green vegetable a day.

Maybe She Can Sew

By GERTRUDE S. STEWART

OUR recent story entitled "She Can Can" has brought a volley of letters from our women who like to do things. Some are seeking advice on learning to can. Others wonder why we tell them about such a good thing after it is all over. We want to help both sorts of inquirers. Last week we gave a few ideas helping those who wish to can.

And now we would like folks interested in contests to read about such a very exciting one when it is just starting. This one will not be over until May 31, so read on and then get your needle and thread. This is a wonderful opportunity for single individuals, or it offers a splendid club project.

One of the largest and best known manufacturers of lovely wash goods is conducting the contest and the rules are so simple that any one can enter—that is—any one who can sew. And Oh! but the spring materials are beautiful. If only I were not so busy, I'd like to enter this contest myself. The next best thing I can do is help you to hear all about it.

Many of you may have heard already. If you have not and are interested I will be glad to see that you have a copy of the rules and directions. The Grand Championship Prize is \$200.00. The entire United States is divided into four zones, each of which will receive its own first prize of \$100.00; second prize \$75.00; third, \$50.00; fourth, \$25.00, and forty-five additional prizes of \$10.00 each. Now isn't that exciting?

Then there are also special lists of prizes for the Juniors, for our school girls and the various girls' clubs. Whichever one you are most interested in we will be glad to see that you have all the details. Do not hesitate. Write today, addressing your letters to Home Department, Pennsylvania Farmer, 7301 Penn. Ave., Pittsburgh, Pa.

Making Souse

IF there is one task about butchering more disagreeable than all the rest, it is cleaning the feet for pigfoot jelly or souse, as some prefer to name it.

Last week I had the job thrust upon me. While I was fussing and scrapping (even tried scraping the obstinate bits with my eyes sighted) the razor lying on the table (don't let this out) and this out, they had put away at they had put away at.

Well, it worked and without soap lather at that I soon had the feet perfectly clean and I did not hear a word about a spoiled razor blade. Of course I had to learn how to take it apart to clean and then put it together again. Now I have a used blade ready for the next butchering.

For the benefit of those who do not know how to make souse I will give my recipe.

Clean the feet and cover with water and boil until the meat is tender enough to slip off the bones. Shred the meat into rather fine pieces. If the feet are off a young animal there should be about the right amount of broth when they are boiled but if they are from an old animal, water may have to be added as it boils away. Season with salt and pepper and add vinegar to suit the taste.

Pour into pans and set in a cold place to harden. Do not let freeze. Cut in squares and serve for lunch.

Do not use too much wax when polishing floors. A little goes a long way. Too much wax makes the floor slippery and collects dust.

Knitted garments should be washed carefully to prevent stretching and laid flat and smooth to dry.

Fitted Lines Are Popular

No. 6749.—Fitted lines and a practical reversible-closing are features of this design. The sleeves are comfortably short and neatly finished with a turned-back cuff. A tiny vestee squares the V-neck and a serviceable pocket trims the front at the right side. Cotton prints, gingham, linen or pongee may be used to develop this serviceable model.

The pattern is cut in four sizes: Small, 34-36; medium, 38-40; large, 42-44; extra large, 46-48 inches bust measure. To make the frock for a medium size will require 4 yards of 35-inch material. For vestee, 4 yards of 35-inch material. For collar, 1/2 yard 35 inches wide is required cut crosswise. To finish with bias binding as pictured in the large view will require 5 yards 1 1/2 inches wide. The width of the neck at the lower edge is 2 1/4 yards.

Price 15c, two for 25c.
No. 6753.—Dress for junior and miss. Cut in four sizes: 14, 16, 18, and 20 years. A 16-year size requires 4 yards of 39-inch material. For contrasting material 1/2 yard 39 inches wide is required cut crosswise. To trim with edging requires 2 1/4 yards.

Price 15c, two for 25c.
No. 6742.—This is an excellent utility style, suitable for light weight woollens, for crepe, velvet and also for linens, shantung and pongee. As pictured it was developed in brown flat crepe with stitching for a finish. The front and back sections are joined to the side portions under the stitched tucks, below which the plaits are formed, that lend fullness in graceful flare outline. The fronts are turned back in

wide revers or lapels outlining a vestee that squares the V-neck.

The pattern is cut in five sizes: 34, 36, 38, 40 and 42 inches bust measure. To make the dress for a 38-inch size will require 4 1/2 yards of 35-inch material. For cuffs and vestee of contrasting material 3/4 yard is required, cut crosswise. The width of the dress at the lower edge with plait fullness extended is 2 1/4 yards.

Price 15c, two for 25c.
No. 6740.—This model is made with surplice closing and a low placed flare. The raised waistline is featured, and is marked with soft shirring at the underarm seams. The sleeve also suggests shirring above the wrist. A surplice vestee, outlines the V-neck line of the front which is trimmed on the right side with a very broad flare revers. This is an excellent model for an afternoon dress. It may be made in canton crepe or crepe satin. Moore is also suggested. Dahlia colored satin with revers and facings of transparent velvet, and lace for the vestee is suggested.

The pattern is cut in five sizes: 34, 36, 38, 40 and 42 inches bust measure. To make the dress for a 38-inch size will require 4 1/2 yards of 39-inch material. To face the revers with contrasting material will require 1/2 yard 18 inches wide and cut crosswise. To underface the flounce, will require 1 1/2 yards of 39-inch material. The width of the flounce at the lower edge with fullness extended is 2 1/4 yards.

No. 6384.—Child's rompers. Cut in three sizes: 6 months, 1 and 2 years. A 1-year

size requires 1 1/2 yards of material 36 inches wide together with 3/4 yard of contrasting material.

Price 15c, two for 25c.
No. 6757.—Girls' dress. Cut in four sizes: 8, 10, 12 and 14 years. An 8-year size requires 1 1/2 yards of 35-inch material. For contrasting material 3/4 yard 35 inches wide is required cut crosswise. To finish with bias binding requires 3 1/2 yards 1 1/2 inches wide.

Price 15c, two for 25c.
No. 6387.—Vest portions finished with pointed lower edges, are outlined by jacket portions, finished with convenient pockets. A cost sleeve and round collar complete the upper portion of this style. The trousers are the usual straight model with side closings. Black velvet with vest and collar of white pique or corduroy will be an attractive combination for this suit. It is also good in two tones of brown tweed or flannel and nice in jersey weaves, or smart wash materials.

The pattern is cut in three sizes: 2, 4 and 6 years. A 4-year size requires 1 1/2 yards of 40-inch material with 1/4 yard of contrasting material for collar and vest portions.

Price 15c, two for 25c.
No. 6762.—Girls' undergarments. Cut in four sizes: 2, 4, 6 and 8 years. To make the set for a 2-year size requires 2 yards of 36-inch material.

Price 15c, two for 25c.
No. 6746.—Printed velvet was chosen to make this model. One could have flat crepe or taffeta. As pictured with collar and with or without sleeves the design is suitable for informal afternoon wear. Without sleeves or without sleeves and collar it may serve as a dress for a formal dinner or afternoon occasion. The short waist portions feature the raised waistline. A shaped panel and flare slide and back portions form the skirt. A narrow belt emphasizes the waistline.

This pattern is cut in three sizes: 16, 18 and 20 years. To make the dress for a 16-year size with collar and sleeves, will require 4 1/2 yards of 39-inch material. Without collar and without sleeves, the dress will require 2 1/2 yards. With collar and without sleeves the dress will require 3 1/2 yards of material. The width of the dress at the lower edge with fullness extended is 2 1/4 yards.

Price 15c, two for 25c.
No. 6738.—Printed silk in a small pattern of black and white is here pictured, with trimming of black crepe and a vestee of lace. The dress has new style features. The style is slenderizing. The waist portions indicate the raised waistline, and symmetric lines on waist and skirt portions are graceful and pleasing. The sleeve is fitted, and shaped above the wrist.

The pattern for this pleasing model is cut in eight sizes: 38, 40, 42, 44, 46, 48, 50 and 52 inches bust measure. To make the dress for a 38-inch size will require 4 1/2 yards of 39-inch material. The band facings and sleeve facings of contrasting material will require 1/2 yard 39 inches wide and cut crosswise. To make the vestee of contrasting material requires a quarter yard 39 inches wide, cut crosswise. The vestee of lace edging will require 1 yard 3 inches wide mired at the center. The width of the dress at the lower edge with fullness extended is 2 1/4 yards.

Price 15c, two for 25c.

Write your name and address clearly. State number and size of each pattern. Price 15c each, two for 25c. Our Fashion Magazine will help in preparing your wardrobe. Copy only 10c. Embroidery patterns 15c extra. Address Pattern Department, Pennsylvania Farmer, 7301 Penn. Ave., Pittsburgh, Pa.

Home Atmosphere

THE child senses overtones of feeling in a home, feels atmosphere, and has a surprising discernment of the currents and undercurrents which run through the lives of the older members of the family. Children love the happy atmosphere. They glory in the feel of a house in perfect order, and appreciate it the more if they help to keep it so.

They love the cleanness of rooms kept shining, the smell of cookies baking in the kitchen, the melody mother plays at the piano. In their appreciation of such things as these, they encourage parents to do their utmost in the art of home-making. Marion Cossitt Brackin.

The school child's lunch box aids both health and grades if it contains nourishing, easily-digested foods. If a hot dish is served at school, egg sandwiches, celery, an apple, stuffed dates and oatmeal cookies round out the lunch.

"A man without mirth is like a wagon without springs, in which one is caused disagreeably to jolt by every pebble over which it runs."

Henry Ward Beecher.

Do your hands a favor—and your clothes, too. Fels-Naptha is kind to both! It is gentle and safe—and it brings extra help. Plenty of napha—the cleanser "dry cleaners" use—blended by our special process with good golden soap. Working together, these two safe, active cleaners loosen the dirt and wash it away—and all without the hard rubbing clothes aren't made to stand! So try it and learn for yourself that...

Nothing can take the place of FELS-NAPTHA

**A COMPLETE SERVICE WITH
ONE STOP:-TIRES~RIMS~
BATTERIES~BRAKE LINING**

Firestone
GAS OIL GREASING TIRES BATTERIES BRAKE LINING
JONES TIRE SERVICE INC.

NOW you can drive your car to one station—make one stop instead of many and secure everything your car needs—tires, batteries, brakes, etc., all taken care of at the same place. That's the FIRESTONE ONE-STOP SERVICE—the greatest step forward ever taken for saving time, money and worry for car owners. Just what you have always wanted—and now ready for you at leading Firestone Dealers' Stations from coast to coast. It is new—different—a revelation, it provides the most complete, most economical and most practical service that any tire dealer can give you.

Note on this page some of the many products and services this great new plan makes available for you through leading Firestone Dealers. See the Firestone Dealer in your community—he can save you money and serve you better.

The FARMALL is a McCORMICK-DEERING Tractor
"If it isn't a McCORMICK-DEERING it isn't a FARMALL"

AFTER ages of hand labor in the harvest field the McCORMICK REAPER came to the aid of mankind. Nearly a hundred years later the McCORMICK-DEERING FARMALL, the true all-purpose tractor, was perfected and announced by International Harvester. Both were great original ideas, of great importance to Agriculture.

When the International Harvester builders designed this *first all-purpose tractor* they christened it "Farmall", because it is the ideal power for all farm operations, including row-crop handling. The Farmall idea and the tractor's good name became extremely popular. Today the power demand everywhere is for the true Farmall and Farmall-operated equipment. When you make the change to all-purpose power, be sure you reap the sound benefits that can be had only with the tractor illustrated above.

Bear these facts in mind: There is only one true, original Farmall—the McCORMICK-DEERING FARMALL. If it isn't a McCormick-Deering it isn't a Farmall. It is made only by International Harvester; its design and its exclusive features are fully covered and protected by many patents. Remember that the name "Farmall" is owned and registered by the Harvester Company and that others have no right to use it. And remember that the McCormick-Deering Farmall is sold only by the McCormick-Deering Dealers.

Made only by **INTERNATIONAL HARVESTER**

☛ The McCormick-Deering FARMALL, with the special 2 or 4-row Farmall planters and cultivators, handles from 25 to 60 acres in an 8-hour day. It cuts a 14-foot swath of hay, with 7-foot Farmall-powered mower and 7-foot trailer mower attached. Handles rakes, loaders, etc. Plows two furrows, pulls all seed-bed implements, and operates grain and corn harvesting machines. Ready for all drawbar, belt, and power take-off work.

PREMIUMS GIVEN FOR MOTHER'S COUPONS

VALUABLE PREMIUMS

Write for the Mother's Oats Premium Catalog. Lists hundreds of useful and valuable articles available to those who save Mother's coupons.

There's a coupon in every package that is good toward lovely jewelry, silverware, leather goods and other carefully selected articles.

The great volume of Mother's Oats sales enables us to offer such attractive premiums. The values offered are exceptionally fine. You'll be delighted.

QUICK MOTHER'S OATS
 WEIGHT 3 LBS. 7 OZ. NET
 The Quaker Oats Company
 ADDRESS - CHICAGO, U. S. A.
 CEDAR RAPIDS, IOWA
 SALTATION, CANADA

Mother's Oats
are rich, flavory—
different from ordinary oatmeal

A premium coupon in every package

YOU can't serve Mother's Oats too often to please your family. They love its rich substantial flavor, steam-hot on frosty mornings. And they know the quick energy it brings benefits them in their work during the day. Now you will like to serve it, too. For cooking in advance is no longer needed. Quick Mother's Oats cooks in 2½ minutes the world's fastest hot breakfast. It's ready while the coffee boils. It is ready before the eggs. Cook it longer, if you wish—it is delicious when cooked quickly. Mother's Oats is most carefully milled to

retain all the rich flavor and energy, for which oatmeal is famous. The oats themselves are cooked for hours at the mills in order to save you cooking time. The only difference you will note is that they're rolled thinner.

It's the way the oats are milled

Mother's Oats are the selected Queen oats—a bushel yields but ten pounds of oats fine enough to bear this famous name. Every package of Mother's Oats contains a valuable premium coupon. The Mother's

premium catalog shows how easy it is to obtain fine Community silverware, jewelry, toys and other things you want.

Start serving Mother's Oats tomorrow. Get it today. Don't deprive your family of its wonderful deliciousness and fine nourishment any longer. At all grocer's.

Start saving today. And write now for catalog. Address: Mother's Coupon Dept. H-2, Room 1708, 80 E. Jackson St., Chicago, Illinois.

The makers of Mother's Oats also make Quaker Oats and Quick Quaker Oats, which you may have been accustomed to buying. They use the same care in selection, the same high standards of milling, that have made the name Quaker a household word.

MOTHER'S OATS Regular and Quick

BODY BY FISHER on these cars - and these cars only

No motor car buyer need sacrifice body quality to price. For, notwithstanding their definite and marked superiority, Fisher Body cars are obtainable in every price field. ¶ All the cars whose emblems you see above, also bear, forward at the lower right exterior of the body, the signature plate of Fisher Body craftsmanship—sign and symbol of authentic style, more luxurious comfort and greater durability. ¶ Fisher Bodies are mounted upon the greatest chassis in their various price fields—for, in point of reliability and brilliant performance, combined with low cost of upkeep, General Motors cars have attained the highest mechanical development. ¶ The emblem “Body by Fisher” appearing in company with the emblem of Cadillac, LaSalle, Buick, Viking, Oakland, Oldsmobile, Marquette, Pontiac or Chevrolet, is, therefore, double assurance, not only of a better car, but of a better motor car *investment* as well.

PENNSYLVANIA FARMER

(287) 19

The Farm Lease

THIS is the season of the year for drawing up farm leases, contracts, understandings—the season for “putting things in writing.” A great deal more important than these so-called contracts is the matter of getting two parties who will each hold up his end of the stick. Neighborhood usage is the safest kind of an agreement and a man with whom one is well acquainted is the safest kind of a tenant.

I believe the large majority of farm “contracts” are not worth shucks. Few tenant farmers can be bound by a contract. It is altogether rare and, so far as my experience goes, unheard of for a tenant to post a bond for the performance of his contract. A tenant may agree to feed all corn and oats and farm roughage on the place, but when the expedient comes about the feed is sold.

The fact is that the contract is very plain. But suppose the tenant has got himself into a tight squeeze financially, well, the landlord prefers his cash to the contract and off goes the feed that was to be consumed by livestock on the place.

No Contract for Mr. Jones

The writer once retired from the farm for twelve years for reasons of health. During those twelve years there were four tenants, sometimes under contract and sometimes not—those last few years no tenant could get a contract from this Mr. Jones! If a tenant is reliable there is not a whit of use for a contract and if the tenant is unreliable then a contract with him is just the same as writing a last will and testament for a man who owns nothing whatsoever.

If a tenant came and asked for a farm of which I was owner my first move would be to turn right around with him that very minute and return to the very spot from which he had started out. After a walk through the barn and about the place he had been farming I would know whether he were a tidy and systematic man or a sloppy one. Then by taking a look at his line of implements and the condition of his harness and supply of fuel at hand I would know whether he was foresighted and provident.

Business Habits

Before we talked business I should say that if a man desired to rent my farm we must first go to his bank and find from the cashier just how he had been accustomed to meeting his financial obligations.

It takes only a hand's turn daily to keep a place tidy. It takes only a bolt now and then or some other minor repair to keep implements the way they ought to be. An hour or two occasionally with awl and thread makes harness testify to the character of the owner just as baling wire, nails or bits of whang line him up as a makeshifter. At the bank the way you find a tenant has been paying others in the past is only the same way you can expect him to pay in the future.

With twelve years of renting in the past and at present farming our farm I should say the way to keep up the improvements and maintain fertility of the land is to run the farm yourself. I take it easier and don't expect to make so much money as if I delved in hard, but there isn't a man under heaven who can be found to take as much intelligent interest in my cows and in my fences and my gates and ditches as I, just I!

Thomas Jones.

Better Seedbeds and Seeding Lead to Lower Cost of Producing Crops

From the time you start to work your land this spring, let Oliver Power, Oliver Plows and Tillage tools, and Oliver Superior Drills lead the way to lower costs of producing your crops.

Oliver Plows—Walking Plows, Sulkies, Tractor Gangs, and the new Oliver Big Base—that turns under standing corn so completely that not a stalk shows—are each designed to do a better job of plowing, and are part of a line from which you may choose the plow that exactly meets your farm conditions of soil, crop, and power.

Disc Harrows—on which all discs, in both horse and tractor types, penetrate equally and deep—Spike Harrows that do their work and are long lasting—Spring Tooth Harrows with real spring—and special tillage tools for every type of farming—and finally the Famous Oliver Superior Drills—disc or hoe type to suit the needs of every community—and Corn and Potato Planters that produce better crops at lower cost because of their accuracy in planting. Assembled under the Oliver Flag is the greatest line of quality tools ever offered to lower the cost of producing crops.

Our new book, “Under the Oliver Flag—Bigger Crops at Lower Cost”, will show you what Oliver is doing today, and will give you exact information on the tools needed in your type of farming. Send coupon for your copy.

THE YOUNG PEOPLE

How I Spend My Spare Time

If you want to get along in this world you must use your time. Lost time is never found again. I am not always on the job, but I try to use my spare time to the best of my ability.

But the subject on which I am writing is "How Do I Spend My Spare Time?" There are very few people who do one thing in their spare time. As any other farm boy I have a various supply of different odds and ends of work for my spare time. I have my daily chores which take place from seven to eight thirty in the morning. Of course I have school to attend.

When I arrive home I work from four thirty to six. I will now try to explain these pastimes in order. I awake about six thirty, hurry and dress, wash and comb. By this time it is a quarter of seven. With a refreshing breakfast I am ready to do my favorite pastime—trapping. I have taken great interest in this work. This is an industrious and energetic occupation. It sure is a wonderful feeling to breathe early, pure morning air. It is a great sensation to be rewarded by the success of your traps.

After I arrive home I prepare for another day of school. Then comes another joy—going to school, talking, singing and running, having lots of fun. Again we have our daily romp at intermission. At four o'clock another school day is over.

I glance at my watch and discover it is four fifteen and time to feed the chickens. Here is another pastime I enjoy. After watching the numerous flocks greedily gulp their food, I gather eggs. The process next in turn is "putting up the eggs." This is putting eggs in dozen boxes ready to go to town to be sold. It is now five o'clock and time for giving David his lesson.

Most of my chores are over for the day. I do little things that are needed to be done around the house. For instance, feeding the guinea pigs. It is fun to watch the little animals running here and there for this and that. After supper I usually read. Nowadays I read a well-known magazine called "The Pennsylvania Farmer." This is the best farm magazine I have read. I pity the person who has not read it. After a person has read this they do not feel tired. And thus with this on my mind I slumber away, a happy boy on the farm.

Pennsylvania. Roy C. Keirn.

A Thousand Years Hence

I WILL proceed to tell what I do with my spare time. Well, I read (a terrible lot) and I day-dream. Then I keep a scrap-book, pasting in it many interesting things: poems, pictures, writings, views. Then I add pictures and paintings of bygone pets, dogs and cats. Some day, when completed, it will be very interesting and mayhap become famous in some museum a thousand years from now.

Butcher
30
"IT'S NO WONDER DADS BALD"
Wilber B. Butcher, West Virginia

George Washington
Drawn by Lillian Alcorn, Pennsylvania

I must say a diary is a pleasant thing to keep. (I began my first one a few days ago.) This, of course, if you don't possess a brother. If you do the first thing you know, a perfect mimicization of written words fall upon the ears of the diners: "The new boy in our class loaned me his history papers," and you almost choke on the potato you are eating.

It was my privilege to read Dickens' "David Copperfield." I liked most especially, David's aunt and the man she called Dick.

I enjoy serious articles as well as stories. Richard Halliburton's book, "New Worlds to Conquer," is very instructive as well as amusing. He tells about an ancient well in which, in olden times, lovely maidens were cast accompanied by youths, as brides to appease their god's wrath and to receive further blessings for the tribe.

Reading the "Young People's Page" isn't a pastime, for that comes in for perusal just as the noon-hour is inevitably dinner hour.

Mary V. Kundra.
Montour county, Pa.

Depends on the Weather

THE way I spend my spare time depends mostly on what kind of a day it is, and the weather.

When I am at home and it is raining, sometimes I go upstairs to my room and amuse myself with my many boxes of treasured articles and papers. Some were made by my own hands and some were given to me by different people to remember them by.

Another delightful place is in the truck room which takes the place of an attic. There I love to look at books which are very old, and look through the pile of magazines, some dated as far back as May, 1903 (26 years old). Then there are books with letters in them, and, oh, just ever so many different things.

Sometimes I read books and write letters and sometimes I just sit and think what I will do the next day.

At school, at recess and noon hour (if it is a nice day) we girls borrow a watch and take walks through the woods. As it is a country school, there are many beautiful sights to see with the green hills and trees, and birds singing, butterflies fluttering in the sun and now and then a squirrel. If it is in the winter, we go to the woods and play deer.

There is no end of fun during spare time, especially if you live in the country.

Millie Kelso.
Pennsylvania.

"James, I must break our engagement."

James, "O well, there are others."
Ruth, "I know it—I just became engaged to one of them."

Like George Washington

WE cannot all be Washington.
And have our birthday celebrated;
But we can love the things he loved,
And we can hate the things he hated.

He loved the truth, he hated lies,
He minded what his mother taught him.
And every day he tried to do
The simple duties that it brought him.

Perhaps the reason little folks
Are sometimes great when they grow
taller,
Is just because, like Washington,
They do their best when they are smaller.
Pennsylvania. Anna Mae Howard.

"With a job like that, you ought to be fired with enthusiasm."
"That's just the trouble, I was."

ECONOMY SILOS

Farm & Dairy

By L. W. LIGHTY

ONE of the most important operations on the farm is the seeding of clover, but many farmers give little attention to it.

In the East the great majority buy their seed and very often the lowest priced seed is their selection. Dealers tell me with the majority price is the first consideration, while a minority demand high quality and purity and then consider the price. Low-priced seed generally carries undesirable weeds, of which we all have too many now. Very often the low-priced seed is of a low or slow germination quality; while we pay for a bushel of seed we get only two or three pecks worth of plants, and it is very expensive seed. Often it is not adapted to our climate and by haying time not many plants are left. All in all, the lowest priced seed is very often by far the most expensive seed.

Get Reliable Seed

It is a wise plan to buy from a reliable dealer and pay the price for pure northern U. S. grown seed. Place a sample under the glass and you can see if seeds, not clover, are there. If such are found better look around until you find some that will pass inspection. My rule always was to buy my seed in good season, in the late fall to midwinter, not that I wanted to sow it in midwinter, but I did want the seed right at hand when the sowing conditions were right.

These sowing conditions might come the end of February, the beginning, middle or end of March, but I wanted to be ready to take advantage of them any time.

On Honeycombed Ground

These sowing conditions every winter wheat growing farmer understands. When the ground is frozen up or well honeycombed then I would be out as soon as there was light enough in the morning to see what I was doing and by the time the sun threw the ground down by thawing a good sized field was sowed. In a few hours the seed was almost all nicely covered and ready to grow as soon as the earth warmed up a little more. Thus the little rootlets were where they should be and not on top as they are if sowed on the solid dry ground.

I am aware that a small number of farmers have seeders that lightly cover the seed and lightly cultivate the wheat and this manner of seeding generally is very satisfactory, but only a few have this equipment.

The Weed Problem

I do not forget that in a big northern fraction of our state the clover seed is sown with the oats at seeding time. That is also very satisfactory, but pure good seed is as important there as it is anywhere, because they can fully match us down here near the Mason & Dixon Line on the number and variety of weeds on the farms. Indeed they go us one better, because they have thousands of acres of the devil's paint brush, which we know nothing about unless we have been up to see it. It is a very bad actor.

In some sections nearly every one sows alsike clover with the red, but many have not yet learned the value of alsike clover. Alsike is a great filler. It has a knack of fitting itself between the red clover and the timothy plants and splendidly thickening the plants for hay and sod. It often grows in spots where red clover will not do well. It makes a desirable and palatable hay and it surely increases the quantity if we add two to four pounds of it to our red clover before we seed it.

Last but not least, alsike clover is a splendid bee pasture and yields lots of the finest kind of honey, so if we have several hives of bees back of the garden they will delight you with their industry, storing an unmatched covering for your next winter's buckwheat cakes.

Let gravity do it!

Don't break your back and arms pitching and lifting out silage. Do it the easy Unadilla way. For the air-tight, water-tight door gives continuous opening at the level of the silage so you simply push the silage out. Gravity does the work.

Door fasteners form a safe permanent ladder. Doors can't freeze. Hoops easily adjusted. Write today for big catalog and discounts on early orders. Time payments if wanted.

UNADILLA SILOS

Seek Mineral Facts

A Stack of Clover Hay

J. E. W., Fayette county, Pa., had a stack of clover hay that he could sell if he can find a buyer. Then he would use the money to buy fertilizer. He has paid \$34 a ton for 2-3-4 fertilizer, he says. The stack of clover hay would be about four tons and he is asking \$8 a ton, or \$32 for the stack. He asks if this would be good business.

We will compare the contents of the clover stack and the fertilizer sacks in plain figures. That formula, 2-3-4, means that you get in the ton you buy 40 pounds of nitrogen, 160 pounds of phosphoric acid and 80 pounds of potash. In four tons of clover hay you would have about 160 pounds of nitrogen, 44 pounds of phosphoric acid and 140 pounds of potash. But if you plow under the clover hay you get a lot of organic matter to decay and put your soil in a better mechanical condition, and besides that process of decaying brings conditions that may add to the soil nitrogen from the air.

The inquirer will see it will be no business at all to trade that clover stack for the ton of fertilizer. Though we have talked for years about the great value of clover, many farmers do not realize how very valuable it is both as a feed and a fertilizer. I cannot imagine a condition when we can sell clover hay from the farm in this country.

L. W. L.

Seek Mineral Facts

THE intense metabolism of the milk-producing cow depends on the reactivity of the mineral nutrients of her food, says Director E. B. Forbes, of the Institute of Animal Nutrition of the Pennsylvania State College.

Important scientific and practical problems in this relation are being studied by Dr. Forbes and his associates in the most extensive mineral metabolism experiment ever undertaken.

Twelve Holstein-Friesian cows are the subjects of this research program and their mineral metabolism will be followed by means of continuous balance experiments throughout as entire year's cycle of lactation and gestation.

All of these cows have calved since November 30, and are now producing an average of over 53 pounds of milk per head per day.

Special stalls have been devised to permit of the accounting for the disposal of the nutrients of the rations, and complete balances are being made of the elements, sodium, potassium, calcium, magnesium, phosphorus, chlorine and nitrogen; and bomb determinations of the energy of the food and the milk are being made as a basis for the determination of the efficiency of the cow in transforming feed energy into milk energy.

This research involves personal attention during 24 hours of every day. It requires practically full time from seven of the scientific men of the Institute of Animal Nutrition, and seven other technical workers. In addition, counsel, assistance and financial cooperation are being contributed by the Agricultural Experiment Station, especially through its department of Dairy Husbandry.

A 21-YEAR-OLD COW

PERHAPS this little item will interest some of your dairy readers. I have a grade Holstein-Jersey cow, "Clover," which celebrated her twenty-first birthday Christmas morning and is now giving a little more than a gallon of milk a day. She is in good condition for her age and never misses a meal. She has been a wonderful butter cow. Of course she has and is now having the best of care. Fannie H. Butts.

Lawrence county, Pa.

A heavy milking herd—THE TRUEST ECONOMY

Dairymen:

A DECLINE in milk prices does not mean that your profits have to stop. You can make fair returns all year round, if only you produce enough milk per cow, and produce it economically.

One of your best aids is the Amco Feed Mixing Service. You must continue to feed a grain ration, so why not feed a ration that helps you to economize? Amco Feeds go farther, because they are highly digestible and contain no fillers. With these feeds you can supplement your roughage perfectly without buying too much protein (the expensive ingredient). Yet by turning to the open formula tag on all Amco bags, you can see that you are getting enough protein, from widely varied sources.

Let your roughage decide which Amco Ration is best for your herd. Amco open formula dairy feeds range from 12 to 32% in protein content.

Your nearest Amco Agent will help you select the Amco Feed best suited to give you all-year profits.

The Story of Woodbine Farm

By W. D. ZINN

CHAPTER VIII

In my boyhood days it was difficult for a beardless boy to obtain a school, for corporal punishment was very generally practiced. A former neighbor and a very warm personal friend of my father had moved into another community and had become the only trustee of the school in his district. My father asked him to let me teach the school. Possibly out of respect for my father, more than for the confidence he had in me as a teacher, he agreed. The fact was, as I afterward learned, that two or three years before some bad boys had run the teacher out, and broken up the school. This information did not give me any particular pleasure, for, as I found on the first day of school, there were several boys in the community who were as old as I and fully as well developed physically.

I engaged boarding with a Mr. Trimble. I shall never forget the question he asked me when I went back to his home on Monday evening, having taught the first day. "How did you get along today?" he inquired. Then he asked me if a certain red-headed boy, calling him by name, was enrolled that day. I replied that he was not. Then he told me he was considered the worst boy in the neighborhood and if I were not very careful he would "run me out." That night did not bring to me the most peaceful slumber.

The Red-Headed Boy Appears

I was the son of a mother who had been a successful teacher for 20 years. Was her son, who had chosen her profession, to fail as a teacher? Banish the thought! Before I had reached the school house the next morning I had made up my mind that I would control the school and teach it, or die in the attempt. I was particularly interested in the new faces that put in their appearance the next morning. Finally the red-headed boy, described by Mr. Trimble the night before, opened the door. He was a broad shouldered, stalwart young man who looked to be as old as his teacher. I spoke very kindly and politely to him when assisting him his lessons. I decided that this boy had been either mistreated or misrepresented. Young folks often jump at conclusions. Promptly at 12 o'clock I announced the dismissal for dinner. The red-headed boy rushed to the door and when on the outside exclaimed in a loud voice: "Boys, stick to me and we'll run that greenhorn out in a week!"

That noon hour was spent in deep meditation, so far as the teacher was concerned. One o'clock having arrived, the bell was rung. The pupils filed in and took their seats. When everything was quiet the red-headed boy began to whistle. I walked across the room and kindly asked him what he meant by such conduct. His reply was against the rules of the school. He said he did not care a damn for the rules. I then demanded of him that he stand on the floor. Never during all my experiences as a teacher did I more seriously desire a pupil to comply with my request. He only smiled a defiant smile and said, "I would like to see you make me do it."

I gave my pocket knife to a son of the trustee telling him to go to the woods nearby and cut me a real hickory switch. I remembered then that Solomon had said, "Spare the rod and spoil the child." This boy had no doubt been spoiled before, but I made up my mind that I would punish him, that is if I were able to do so.

Having been supplied with a real "honest-to-goodness" hickory, I again pleaded with the boy to stand on the floor. I told him I did not want to whip him on the first day he was in school. If I ever told the truth I did

it then for there were more reasons than one why I did not want to whip him. Moral suasion having failed, I began to strike him across the shoulders. The boy jumped to his feet and began to return the compliment. A fist fight ensued that still today is not pleasant to think of. Finally I threw him on the floor, placed one hand on his throat and with the other seized the whip and continued to strike him until he said: "I'll stand on the floor, if you'll quit."

A Victory

I was just as anxious to stop as the red-headed boy was to have me. The truth is I was almost completely exhausted. During the fight the boy had scratched me on the cheek and the blood was running profusely down my face. The smaller children, witnessing the struggle, and seeing the blood streaming down my face, began to cry. Peace and quiet prevailed and we went on with our afternoon program.

When I returned to my boarding house that evening Mr. Trimble said, "It looks like you had been in a fight and had got the worst of it." I then explained what had happened and told him the red-headed boy had stood on the floor until I asked him to take his seat. "You have won out," said Mr. Trimble, "and I do not anticipate any further trouble." He was a true prophet, for that was the only trouble I had during the four months. The red-headed boy and I were soon fast friends. He frequently brought me apples and at noon we often took walks together. No doubt, many of my readers will conclude that I was too hot-headed and should have controlled the boy by moral suasion.

Ten years later, when I was visiting that school as County Superintendent of Schools, a man came up and taking my hand shook it very cordially. I did not recognize him. He said, "You ought to for I am the boy you choked on the floor." Continuing, he said, "That was the turning point in my life. I am a better man today because you controlled me in school."

I received twenty-five dollars per month for the four months teaching. When the school closed I had all the money except sixteen dollars that I had paid for board and the amount I had spent for candy with which to treat the children at Christmas.

Sixty-five Pupils

There was a school at Flemington, W. Va., called "West Virginia College." The term consisted of ten weeks. It was a boarding school. The board and tuition for the term cost thirty-one dollars. With the proceeds from teaching my first term of school I was able to buy all the "store" clothes I needed and to pay my expenses in this school for two terms. I received an advance in salary the next winter of three dollars per month, for in the meantime I had obtained a "number one" certificate.

I recall with considerable pride one term of school I taught. The enrollment was sixty-five, ranging in age from six to twenty-two years. Some of these pupils were studying higher mathematics and Latin. No pupil worked harder at night than the teacher who prepared the lessons for the next day. I had so many classes that in order to give all the pupils a chance I had one class to come at seven-thirty in the morning and kept another class until five in the evening.

Aside from public schools, I taught six summer schools. These schools were called "Select Schools." The student body was composed of teachers or those preparing to teach. The first of these schools was taught at St.

George in Tucker county, in the spring of 1880.

St. George was nestled among the Cheat Mountain Ranges, and on the banks of the picturesque Cheat river, so I took my wife along to spend the summer with me. Much to my surprise and more to my gratification when the school opened we had sixty-five pupils, and for two weeks they continued to increase until we had ninety. This included, however, those who were in the grades. Thus it will be seen that Mrs. Zinn became a real helpmate from the beginning of our married life, and she has ever continued to be such.

Fishing for "Red Horse"

Very few, if any, more pleasant summers have I spent than the one at St. George. Cheat river at the time was alive with fish, and many of the sportsmen went "gigging," as they called it. My host was an expert at fishing, and often wanted me to go along with him, but it was a violation of the law to kill fish with a gig, and I thought a teacher ought to be a law-abiding citizen. One evening my host said, "Rev. Mr. — is going with me tonight and we would like for you to go along if you do nothing but carry the fish for us." The temptation was too great. I thought if the preacher could afford to gig fish the teacher could afford to do so. The fact of it was, there was scarcely an able-bodied man in town who did not catch his fish by that means. I not only went, but I determined to go the "whole hog" and took a gig along.

A Preacher's Example

It was a moon-light night, as we wended our way down the river. On the way we secured some material from which we made three good torches. All the time my conscience was telling me that I was doing wrong. I wondered whether the preacher's conscience was speaking to him in the same way. If it did he said nothing about it, so intent on gigging was he. I wondered all the time if I could hit a "red horse," for that was what they called the fish we sought. One torch was lighted and carried by one of the men walking between the other two. We had not gone far, until I spied a red horse. Throwing my gig, I struck him just where I aimed, behind the head. I am not sure that I heard my conscience any more that night, but how could I when the river was roaring, and the red horses were darting hither and thither?

One torch was soon burned out when a string of fish that reached from my shoulder down into the water had been caught. It now became necessary that one of us should quit gigging and carry the fish and torch. Because I was not an expert, it fell to my lot to do this much as I would have preferred to have continued the sport.

County Superintendent

In the spring of 1881, I was elected County Superintendent of Free Schools for two years at a salary of \$250 per year. The law required me to visit every school at least once a year. At that time there were about ninety schools in the county. Former superintendents had made it a rule to visit three or four schools a day, but I believed that, if the visit was to be worth while, the superintendent should remain long enough to learn something about the workings of the school. I, therefore, made it a rule to visit but two schools a day. We held a night meeting at the school visited in the afternoon. On each Saturday during the term of school we held a teachers' institute in some district of the county. We had district examinations for the more advanced pupils, and issued school diplomas. The term of school was four months, and the superintendent spent almost every day at his work from the time the schools began until they closed in the spring. (Continued on page 20.)

A CORRECT PUMP FOR EVERY SERVICE

Electric or Engine Driven
Twelve Sizes and Styles in Goulds Ever-Oiled Water Systems. All Pumps Guaranteed Two Years.

REGARDLESS of what your home water supply problem may be, there is a Goulds Ever-Oiled Water System to solve it—economically and dependably. Twelve different sizes and styles, ranging in price from \$72 to \$135, include a system for every home and farm use.

The pumps are all unconditionally guaranteed for two years against trouble of any kind. They are equipped with ball bearings permanently sealed in grease—they never need oiling.

These systems are either electric or engine driven. The electric outfits are self-starting and self-stopping, and the automatic features of all the outfits do away with the need for attention.

Outfit W-405

A complete system for storage supply where water required. Complete includes new Ever-Oiled Ball Bearing Pump, 1/2-h.p. A.C. or D.C. motor; 42-gallon galvanized tank with automatic air volume control and complete fittings; pressure switch set to start at 23 lb. and stop at 43 lb.; relief valve; air valve; and endless, non-slipping, rubber and fabric V-belt, belt tightening adjustment. Pump and motor mounted on pressed steel base. Floor space 14 1/2 x 29 x 48 inches high. Price \$121 (with 60-cycle A.C. motor).

Outfit W-405

Outfit W-400

Outfit W-400

Where larger quantities of water are required, this pumping unit with pressure tank is ideal. It provides adequate supply of water for fire protection and sprinkling. Outfit complete includes the Ever-Oiled Ball Bearing Pump, 1/2-h.p. A.C. or D.C. motor; pressure switch set to start at 23 lb. and stop at 43 lb.; air valve and relief valve. Pump and motor mounted on pressed steel base. Floor space 14 1/2 x 29 x 23 1/2 inches high. Price \$95 (with 60-cycle A.C. motor). Can be used with either open or pneumatic tanks.

Outfit W-400

Outfit R-402

Outfit R-402

Outfit R-402

For water requirements up to a capacity of 420 gallons an hour and where electric current is not available this engine driven Ever-Oiled system renders dependable service. It has a V-belt drive. Outfit complete includes Ever-Oiled Ball Bearing Pump, 1/2-h.p. 4-cycle gasoline engine with foot starter; endless, non-slipping rubber and fabric V-belt with belt tightening adjustment; relief valve and heavy oak base. Floor space 15 x 33 x 26 inches. Price \$133. Can be used with either open or pneumatic tanks.

Outfit R-402

Where Ever-Oiled Water Systems are Obtainable

The complete line of Ever-Oiled Systems is now available through the following distributors or their dealers:

ALLEN TOWN, PA.: Wm. H. Taylor & Co., 250-56 Hamilton Street.
BALTIMORE, MD.: Chatard & Norris, 218 Water Street.
LANCASTER, PA.: Henry R. Herr, The Pump Man, Ann and Fulton Streets.

YORK, PA.: Geo. F. Motter's Sons, S. Water and Princess Streets.
PITTSBURGH, PA.: Goulds Pumps, Inc., 636 Henry W. Oliver Bldg.
PITTSBURGH, PA.: Tranter Mfg. Company, 105 Water Street.
PITTSBURGH, PA.: Malone Plumbing Supply Company.
READING, PA.: Lang Engineering Company, 324 Walnut Street.

For those in need of information on specific pumping problems, Goulds Pumps, Inc., has a wealth of data available at any of the above distributors or their dealer in your neighborhood. Let them help you solve your pumping problems. If your dealer can not give you the desired information, write us for catalogue showing the complete Ever-Oiled Water System line.

GOULDS PUMPS
SENECA FALLS, NEW YORK

New Jamesway

BOOK SHOWS HOW

You Can REMODEL
Build, Ventilate and
Equip Your Farm Buildings

and **MAKE MORE MONEY** from *What's New In Jamesway*

Good farm buildings are essential in the housing of farm animals for profitable production, whether it be Cows, Hogs, Poultry or Horses.

That's a big mistake and that's where Jamesway can help you. It isn't always necessary to build new buildings in order to enjoy these conveniences and bigger profits. Usually the old unsanitary and inconvenient buildings can be remodeled, rearranged and made into comfortable, convenient quarters that are just as satisfactory as a new building at only a fraction of the cost.

The new Jamesway book shows how old buildings can be remodeled at minimum cost—shows how buildings should be arranged for greatest convenience—shows pictures of buildings on a number of farms, both before and after remodeling—contains letters from many farmers who tell their experience and benefits gained from remodeling.

All farm animals respond to cleanliness, to light, well ventilated quarters, to comfort, in better health and ability to produce.

Good farm buildings not only increase the production of the farm animals but conveniently arranged well equipped buildings make working with live stock easier and more attractive.

Every farmer has a desire for modern convenient buildings that will enable him to make more money from his farm stock, but too often puts it off year after year, fearing that the cost would be greater than the benefit gained.

By all means send for this book before you remodel, build, ventilate or equip any farm building—learn how Jamesway assistance in planning and arranging will save you a lot of money on material and construction cost, and give you a building that will never cause you any after regrets—one that you'll always be proud of and one that will enable you to get the fullest measure of profit from your stock.

For more than a quarter of a century Jamesway have been makers of equipment and systems of ventilation used in housing

cows, hogs, horses and hens. Jamesway equipment is recognized everywhere as standard. Farmers who want the BEST always specify Jamesway equipment. Of the 89 dairy cattle exhibitors at the 1929 Dairy Show 44 have exclusive Jamesway equipment in their barns and 12 have their barns partially Jamesway equipped.

Naturally as leaders in the building of equipment we must also be leaders in designing and planning farm buildings because good as Jamesway Equipment is, it cannot give to its owner the fullest measure of satisfaction if it goes into a building that is poorly planned, wrongly constructed or inconveniently arranged.

That's why we have developed the largest and most efficient organization in the world for planning and developing better farm buildings—types of buildings that when equipped with Jamesway equipment will pay for themselves over and over again in greater returns.

Send Coupon today for the New Jamesway Book—see how Jamesway can help you with any remodeling or building problem. This book is the most complete book of its kind ever published. If you are thinking of remodeling or building any farm building, you should by all means get this free book. Mail coupon Now. No cost—no obligation.

If You Want The BEST In Buildings and Equipment Consult Jamesway

For 25 years Jamesway Equipment has been the preferred equipment by farmers and poultry raisers. We appreciate this high regard in which products bearing the name Jamesway is held by farmers everywhere. Such public confidence can only spur us on in a greater desire to serve better. We are happy to be able to announce to the farmers of America that the following new Jamesway products are now ready to help you make more money from your farm stock.

- 1 New Jamesway Hot Galvanized Barn Equipment
- 2 New Jamesway Cow Comfort Stall Partition
- 3 New Jamesway Insulation for all Farm Buildings
- 4 New Jamesway Detachable Salt Cups for Cows
- 5 New Jamesway Ventilation for all Farm Buildings
- 6 New Jamesway Heating System for Poultry Houses
- 7 New Pointed Arch Poultry House, a complete unit
- 8 New Pointed Arch Farrowing House, a complete unit
- 9 New Jamesway Tile Silo with 10 Improvements
- 10 New Jamesway Farm Building Tile

DIBBLE'S Farm Seed Catalog FREE

We have been growing farm seeds for nearly 40 years and selecting varieties best suited to the various sections of the Eastern States.

From small beginnings I have built up perhaps the largest mail order strictly farm-seed business in the country, which is recognized as the leader in the line.

No pains or expense are spared to secure the best producing strains for customers. Thousands of farmers buy Dibble's Seeds, year after year, on the record of production.

Dibble's Farm Seed Book is worth many dollars to any farmer.

It will save dollars in the cost of your Spring seed supply or seeds that are of the highest quality obtainable. It is free to any farmer. Dibble's Farm Seed Book does not tell about other seeds—just farm seeds. It contains colored illustrations of the standard varieties profitable to grow. If you will write me of your seed problem, I will give you my personal advice based on an experience of 40 years in farming and seed growing. Potatoes, corn, oats, barley, alfalfa, clover, grass seeds, etc. Dibble's Seed Farms consist of over 1,000 acres in the famous Genesee Valley.

Good Seed of the right selection is the first essential to a profitable crop. If the seed is not right the thought and care of the season may be wasted.

Dibble's Alfalfa Seed

D. B. Brand, Northern Idaho grown, purity our test 99.60%, \$16.00 a Bu.
D. B. Brand Grimm, Montana grown, purity our test 99.60%, \$24.00 a bu.

Dibble's Clover and Timothy Seed

D. B. Brand, average purity for years above 99.50%.
Medium clover \$13.50 a bushel
Mammoth clover \$13.75 a bushel
Fancy Alsike \$13.20 a bushel
Timothy \$3.75 a bushel \$11.00 for 3 bushel bag.

Dibble's Reclaimed Timothy and Alsike Natural Mixture averages above 20% alsike, less than 1% of weed seeds, \$4.75 a bushel; \$14.00 for 3 bushel bag.

Dibble's Seed Oats

Heavyweight, Twentieth Century, reclaimed and graded, average weight 10 lbs., both proved heavy producers under varied conditions. Price \$1.00 a bushel.

Dibble's Seed Barley

Alpha 2 rowed (late) \$1.65 a bushel.
Olerbrucker 6 rowed (early) \$1.50 a bushel.

Dibble's Seed Corn

Average germination above 90%.
Mammoth Yellow Flint, Improved Leaning, Sweepstakes, Lancaster County Sure Crop, Early Yellow Dent, Mammoth White Dent, Golden Glow. All these varieties and others listed have proved their worth. Several kinds as low as \$2.00 a bushel.

Dibble's Russet Potato

Introduced by me, universally proves one of the heaviest producers in good and bad seasons, it is of high quality and a general favorite either for market or home use.

Our frost-proof storage houses 400 feet in length are filled to capacity with Seed Potatoes both Certified and selected including all the popular varieties at prices you can afford to pay.

Prices quoted are those prevailing when this paper goes to press. Dibble's Complete Price List issued weekly during the season.

"Verified Origin" on all Farm Seeds if requested.

"Everything for the Farm"

Let me estimate on your Farm Seed requirements this year. My prices will surprise you.

Farm Facts and Fancies

By ALVA AGEE

THE guava is a sub-tropical fruit of distinctive flavor, and is specially valued for jellies. We have two trees and they are peculiarly attractive to me on account of their happy-go-lucky schedule for fruiting. There appears to be three distinct but over-lapping crops within the year, and late in December there was a heavy crop of belated green fruits about two-thirds grown. The guava needs a great deal of water, and watering has been neglected. Matters were at a standstill, and so I fertilized heavily and soaked the ground for two days, thinking I could get action. I did. The fruits were too much toughened by neglect to expand naturally and so they split open, making themselves worthless and ridiculous. They couldn't stand prosperity.

Many of us need to use the old prayer, "Give us neither poverty nor riches." If those guavas had had a modest income of plant food and water throughout their lives to meet modest needs, they would have amounted to something. As it was, they blew up.

Obedying the Law

The Congress, the churches and other associations of individuals are discussing the general attitude of the public toward law observance. A traffic officer told me that the law was broken every minute at the intersection where he was stationed.

You cannot well arrest all the public, at least at one time, and when a regulation appears absolutely unreasonable, and was made only as a check on recklessness and a means of easy conviction in case of accident, most people will stay within what they think is in the officer's mind and not what is in the statute book.

Stringent regulations that no one proposes to enforce tempt the most of us to become law-breakers and the result is deplorable. Ill-considered laws are piled up by legislative bodies as threats. Some simple, sane and moderate laws, that meant exactly what they said and appealed to the great majority as reasonable, could be enforced, and law observance would come back, or part way back.

An Apology

I have a letter from an unduly appreciative reader who is troubled by the use of the word "socialistic" that was made by me when commenting on the effect that the five-days-a-week program of labor leaders would have on farmers and people having fixed incomes. I had referred to the leveling of property rights as socialistic.

I could defend employment of the word when used so broadly that it does not serve as something definitely descriptive of modern socialism. Such use of the word is common, but I prefer to say frankly that I should have worded my statement differently.

Used in its broadest sense, socialism characterizes the trend of thought and action in all our progressive nations. That is to say, human rights bulk larger with us in each succeeding generation, and constantly are more influential in legislation. It is something else entirely to want to eat the bread another has earned.

"In Fun or In Earnest"

My correspondent says he doesn't know whether I was "half in fun or wholly in earnest." Sometimes it is better to leave matters that way and not take one's own opinion too seriously. It is a good deal more important to get one's associates thinking about something of value that may lie in one's mind than it is to assume that he can instruct them. A lot of instruction has a way of getting permanently on a side-track and

Snow scene on the farm of John Snyder, Franklin county, Pa.

we move along to clearer vision. The tremendously important thing is that every one do a lot of thinking for himself.

If a writer leaves some statements on the edge between fact and fancy he may really be as near the truth in respect to that particular matter as he can get for the time being. He stirs the reader to think it through. He will have done about as much as the most of us are equipped to do. Holding fast to some essentials, the chief thing is to make a little headway all the time toward the future.

Substitute Crops

When there is excess production of a crop in one region, or when some insect menace, like that of the cotton borer, is facing a locality, our farmers seek substitute crops. I recommend to the farmers. Growers elsewhere may know that they have more than meeting present market demand, and they do not want more competition, but our advisers are the right. Their business is to give the best counsel possible to the individuals confronting loss, and if the farmers can substitute something that they can produce more cheaply than those now in the business the way should be open to them.

It is the old fact that individual interest often is anti-social. We would be back in primitive times if the individual was not free to make use of his natural advantages and natural ability to succeed, and in farming this country success is based largely on ability to keep cost of production down below the average. Therein lies much of the net profit.

Buying on Credit

The people in the thirteen American colonies had little money to use in business transactions. They "traded" products with each other and with Europe. Later came the day when a big amount of credit could be based safely on the limited stock of gold and silver, and business expanded. There is no limit to want, and our present rapid increase in production and consumption is due in small part to a buying power resting on probable future ability to pay.

Consumers create a market for producers' goods by pledging payment when they earn the money. They buy on the installment plan, and have been keeping the country busy supplying their wants.

President Hoover's call on industries to keep men employed is promising to be effective, and if such is the outcome installment buying will have escaped a critical test for the present. The call could not have had much effect if conditions had not been pretty sound industrially. An old-fashioned, conservative and dependable way is to base purchase on earnings.

On the Cover

The Taos Indian shown on our cover this week was said to be 103 years old when the picture was taken.

pion, and his prize-winners

GRAND Prize, National Corn Show, Hannibal, Mo., for the best bushel First Prize for the finest ten ears—Grand Champion ten ear corn sample, meeting of the Missouri Corn Growers' Association!

"And with the help of Red Steer, we hope to repeat this success," writes Roscoe Powell, Brown-
ing, Mo.

"My son Jay and I used Red Steer high analysis on our corn. Here is what happened! At the National Corn Show, Hannibal, Mo., in which practically every state in the corn belt was represented, I won first prize for the best bushel of corn. I also won first prize in the National ten ear class. My son won fourth prize in the bushel class.

"At the annual meeting of the Missouri Corn Growers' Association, at Columbia, Mo., my son and I carried off three of the five prizes, and won two other championships.

"We have been shown that it pays to use Swift's Red Steer high analysis complete fertilizer."

There is a definite connection between profitable high quality crops and high quality fertilizers, as successful farmers know.

Look for this Certificate of Quality when buying fertilizers. You'll find it attached to every bag of Red Steer. Your assurance of BEST MATERIALS, DOUBLE MIXED, TRIPLE TESTED

Like Mr. Powell, they look for the Swift Certificate of Quality on each bag of fertilizer. It assures: BEST MATERIALS, DOUBLE MIXED, TRIPLE TESTED.

BEST MATERIALS—plant food from the most productive sources.

DOUBLE MIXED—fertilizer thoroughly mixed and in good drilling condition so that each plant will get its share of plant food.

TRIPLE TESTED—in fully equipped laboratories, assuring the right kind of plant food in the right form and right amount.

Look for the Certificate of Quality attached to every bag of Red Steer.

Let Red Steer build new profits for you. Ask your Authorized Swift Agent about Swift's Red Steer 7-11-7; 3-12-15 and 4-16-10—the money-saving high analyses.

The economics of AGRICULTURE are changing

ARE YOU half farming all your acres instead of intensively farming half your acres? This is the charge that some authorities make against many farmers. Does it apply to you?

Modern farming is intensive farming. A full yield from 40 acres always shows more net profits and surer profits than a half yield from 80 acres. It means less work in plowing, planting, cultivating and harvesting. It means less money for help, seed and implements.

One of the outstanding aids to intensive and profitable farming is the generous use of fertilizer.

Unquestionably NPK, which has 45% available plant food, is a forward step in fertilizer manufacture. It helps to maintain soil fertility. It is a super-fertilizer. It has enough nitrogen to grow a large crop

quickly; phosphoric acid to mature it early and avoid the danger of frosts; and enough potash to insure a healthy plant and a crop that will grade

high in the market. NPK is properly made. It has the proper ratio of plant food elements. It is in splendid mechanical condition; it is fine, dry and drillable, and can be applied in small or large quantities with ordinary fertilizer attachment.

NPK furnishes one of the best means of reducing cost of crop production, improving quality, and increasing the dollar return per acre.

IN addition to the continual questions concerning garden tractors, the proximity to the spring planting season has brought a number of queries about small fruit and vegetable culture, including varieties. I shall try to lump these answers in a summary so as to save time and space.

Strawberries
The successful culture of strawberries requires that the soil be fertile and of such a nature as to make cultivation easy. Good corn soil usually makes a good location for strawberries. It should be full of humus and reasonably free of stones, although I have seen good crops where small stones were abundant. But it is not nice to work. If the ground has had a heavy application of manure made to a previous crop it is an ideal preparation.

After the plants have started and become well established, an application of a complete fertilizer may be made; one analyzing 4-8-10 is satisfactory at our place. If the soil is not in good fertility, half the amount, say 300 pounds per acre, may be applied before setting, and thoroughly worked into the soil. Under no conditions should fertilizer be applied in the row just ahead of plant setting. Lime seems to be not an essential, although experiment stations differ on this subject. Begin cultivating right after planting, keep weeds down and hoe when necessary. Rows should be at least four feet apart, and the plants set 15 to 18 inches apart in the row.

It is well to have two or three kinds when the main object is a supply for home use, or where one is interested in experimentation. But at Neshaminy Gardens we have reduced the number of varieties to one—the Premier. This variety is good for home and market, and is so good in every way that we have no other kind now. All good, up-to-date plant growers have this variety. Of course, it may not be as good for every locality. Strawberries are somewhat peculiar in this respect.

Tractor Plowing
In spite of the number of times I have told about the use and limitations of garden tractors, inquiries continue to come in, asking if they can be used to do all the plowing on places of from three to ten acres. It should be understood once for all that a true garden cultivator will not do general plowing. It will plow and do a good job with a seven to eight-inch plow. But anybody acquainted with plows knows that the depth to which a plow can go is dependent on its width. Twelve and fourteen-inch plows can be run to a depth of from four to eight inches. But an eight-inch plow is limited to three or four inches in depth.

A garden tractor of the better kinds will plow four or five inches deep with an eight-inch plow, provided the soil is fairly friable. Modern garden tractors with engines having three to four horse power will do this. But don't forget that honest-to-goodness plowing of ordinary field soil requires more power than that if such soil is to be plowed deep enough. Garden tractors are primarily for making rows, covering seed, light disking, cultivating, etc., and for this work a good one is a good investment.

Cantaloupes

We have had the extremes of success in raising cantaloupes—good and bad. Two years ago we raised the finest vines I ever saw. From the

first up to the time the melons were nearly ready to ripen they were idling. Then, suddenly, the aphids hit them and in spite of all we could do the vines went floey, and the most of the crop never ripened properly. Another year they blighted in spite of thorough spraying.

Last year we planted only a hill and gave them scant attention. There was no blight, no aphids, and several good melons. Some of the best ones for us are Emerald, Fordhook, Milwaukee Market, Osage or Miller's Cream. Melon growing in the East is more of a game than it is in the dryer climate of the Southwest.

A P. S. to one of my correspondent's letters says: "Tell us about your family and grandchildren when you feel like it and don't mind us the 'crabs' say. Most of us like to hear about them."

Friendly Talks

By Edgar L. Vincent

WE will all lift a little and spring will soon be here.

Yes, spring is already beginning to tug at the latches so that she gets out and begin the season's work. We can think of a lot of things that can do, and perhaps is even now doing. Throwing the blanket of snow to the winds, warming up things on the south side of the house, so the old dog likes to stretch himself out there on sunny days. Here there a brave catkin appears on the willows down by the creek. Streams of water on warm days course down the hillside on their way to the larger streams below. Spring can lift a lot, and such a person as she is too!

But you and I. What can we do to make spring come a single bit faster? We would like to boost. We are like the fellow who sang in the choir. He had about as much of a voice as a frog in springtime. He wanted to sing in the choir, he said he could "yell like sixty" if only knew when to yell.

A few things we can do, however, that will shorten the time between now and the real spring days when we are coming. We can act as if thought spring were coming. Some times when we talk about spring plowing at the door, our mouths have a downward slant that leaves the impression that for us spring seems forty miles away.

Oh, that downward curve at the corner of our mouths! It indicates anything but happiness on our faces. We are not half as happy as the rooster is. He crows so you can hear him half a mile and every crow says "I'm tickled to death to think spring is most here!" That is the way it ought to be with you and me. We ought to laugh and shout and kick up our heels and hunt up something to do at home or around the neighborhood that will make everybody happy.

Because, don't you see, spring is the thing of the heart. You can make spring everywhere if you are busy spring in your heart. The busier you are, the warmer your heart, and the more you will thaw out all the icicles and the early flowers a chance to spring up and make the world a bit more beautiful.

The love for horse racing still lives.

A Part in the Show

By W. W. McWHEELLOCK

track to visit and to mill around. And they weren't all Sunday vehicles that the fair-ground police, with loud-voiced authority and hickory canes, parked—nobody used that word then, nor knew its present meaning—and shoved into a formation that became a promiscuous tangle at going home time. More than one farm wagon, bedded with timothy or fresh straw and carrying a cargo of wide-eyed family and home-grown food, rolled out of the barnyard soon after midnight and rumbled into the fair ground at break of day. It was an achievement to get there first.

Remember?

"Three-minute" horses led their stuff going to the fair—and returning home. The roads were clogged with them, reined high, with rows of red, white and blue rings in the overchecks. You old boys with graying and thinning thatches, remember how steady your hand was on the lines, and how you held the whip with a red ribbon bow on it. Some of you carried the whip around with you all day. Remember? Your girl liked the way you showed off. You did it for her, and she married you because you were good at it.

And the horses tied in rows along the fence, with board and scantling and fence rail partitions to keep the cross old mares from kicking the gizzard out of everything near. Many a trusty steed carried his county-fair marks to the grave. Occasionally a heaving halter pulley would wreck a section of fence and turn loose a bunch of horses, making more work for the already hot-up police.

Noontime! The baskets, washtubs and cheese boxes of fried chicken, pickles and cake! A jug of cold tea! "Somebody must go for a pail of water!" And there was a long line waiting at the rickety pump. It was a good well that held out at fair time. The men stood eating with one foot on a hub—they could hold more standing—and threw ricks of chicken bones under the vehicles. Dinner was over by time the races started. A few pious folks didn't believe in horse racing—but why bring that up?

The small-time, country race horse man of those days was of a distinct and interesting type, now almost gone. Gone, too, are the multitude of his friends and supporters, the farm breeders of trotters and pacers; every colt a potential Maud S or Nancy Hanks. They were a hard-up lot, those county-fair race campaigners—but a hopeful lot; like the gold prospector with shouldered pick and

a day's rations in hand, expecting to strike it rich just over the hill.

The love for horse racing still lives. May it never die! And, Editor, here's one old timer who prays that the men who are financially able to play will continue to breed trotters and pacers; that the county-fair race card may be always full.

The admiration for and dependence on good livestock are as great today as ever. The county fair offers a place to show what we have done to improve our crops and livestock. The management that makes this feature attractive for the boys and girls is making the best use of the sound old institution, The County Fair.

It's harder to make an event now than it was in days gone by. The county fair management that can make the county fair of today as good or better for this generation as the fair of years ago was for those of us who look back through the glamour of years is doing no mean job. The same formula, the same program won't work equally well in maintaining and up-building all county fairs; but as shown by Betty Eckhardt, each county, each management can discover the right program when they set about to find it.

Look Up the Records

SOME of the most surprising things come up when titles to property are examined for farm loans. There at the court house is the plain record, but somehow no examination has ever been made until something comes up so that an estate is to be divided or a loan needed. Delving in musty records of the past is interesting business, but some very disconcerting things are dragged to light in many instances.

A young man who inherited a small piece of land took it into his head that it would be well to dispose of this tract to a farmer near needing land without buildings, and buy another desirable farm on which he could live. But when the records were examined there was found a judgment against his inheritance that had been eating into it for sixteen years, costs, interest and all.

All kinds of things are revealed to people who have lived confidently on their farms for years. The necessity for a loan brings up the difficulties that are not always easy to settle. An old lady who had neglected to sign a deed forty years before promptly said it would take one hundred cash to induce her to put her name to the paper, and she got it.

Another man who had inherited a farm in boyhood from his grandfather never had heard the terms of the will. He improved the place, had fine buildings and then discovered that it would go at his death to some cousins he was not particularly fond of, unless he had a blood heir. "And me a confirmed bachelor!" he said humorously when the loan was refused because of the flaw in his ownership. "Well, I can't get a loan, but I'll see about heading off those shiftless cousins."

That was five years back and he now seems happy with his wife and children. He says he is going to head off those cousins by taking extra good care of his sturdy youngsters.

It doesn't cost much to run your property back, and if applying for a loan reveals any flaws the sooner you know it the better. Farm Loan Agent.

TO PROTECT SHIPPERS

LAST week the House Committee on Agriculture held hearings on the Summers bill (House bill 5663), which provides for federal licensing of dealers, commission merchants and brokers in perishable fruits and vegetables. Several states now have laws of this nature but they are inadequate because so much of this business is inter-state. There is great objection, and properly, to the extension of federal control of business; but that should not stand in the way of this legislation for the protection of shippers who cannot be protected in any other way.

COMMERCIAL CATTLE SHOW

CATTLEMEN in eastern feeding territory will be glad to learn that the Lancaster Fat Cattle Show will be held June 18-19, with the prospect of being better than ever. This show is unique in one respect—the cattle competing for prizes must have been bought as feeders at the Lancaster stockyards. This is the biggest show of purely commercial cattle in the country and it furnishes plenty of evidence of the skill of eastern feeders.

THE OLD PLAN

LAST October the wool producers of Australia attempted to maintain the price by restricting the amount offered. That appeared to be successful for a time. But the wool had to go to market sometime and when it went in large volume it had the inevitable effect. Now a system of control similar to the British-Australian Wool Realization Association is being discussed, but with little prospect of adoption. The best thing to do with the Australian surplus is to follow the old plan of getting it used up and out of the way, incidentally stimulating the use of it by all legitimate means. Fortunately fashion is again tending toward increased use of wool, and that will probably do more than all the schemes to restrict production, to limit selling or to control price through government action or official agencies.

FERTILIZER ON GRASS

THE effect of plant food on pastures, not only in regard to the extra amount of grass produced but also in regard to the nutritional properties of that grass, has been the subject of study by scientists and fertilizer interests. The results of such study indicate that a cow on pasture may have a full stomach and yet not get enough of some things to

supply her system, resulting in malnutrition and attendant ills. This is in line with practical experience and observation, which have been that cattle in certain places do better than in other localities, presumably because they get the needed minerals, vitamins or other substances. Whether it be done for the extra amount of grass produced or for the addition of some more or less mysterious ingredients in that grass the fertilization of pasture is generally profitable. It merits attention because of the probable deficiency of land from which generations of animals have carried something away and because of the importance of pasture in the successful management of most livestock.

FROM LIFE

FOR several years, back in the last decade, a certain breeder of pure-bred cattle held a successful annual sale. Each year he went out and bought a number of cattle because he had not enough of his own to make an attractive offering. As prices were advancing all the time he made plenty of money on what he bought and what he bred, so he decided to make a big sale and bought plenty of cattle for it. But before sale day came the boom in cattle collapsed. He had to sell his costly cattle at a heavy loss. Some men who owed him for stock bought at earlier sales were unable to pay their notes. Instead of being independent as he expected he barely escaped bankruptcy. As a breeder he would have made good money while the boom lasted and would have had little actual loss when it busted. As a speculator he merely went too far, as most speculators do sometime.

A LED BULL

THIS time let us quote from a letter written us by J. F. Wyant, Crown, Pa.:

"Charles A. Black, farmer, granger and highly respected citizen living near North Pine Grove, Pennsylvania, was gored to death February 18 by his five-year-old registered Guernsey bull. He and his twelve-year-old daughter lived together, the mother being dead. When the child came home from school she could not find her father and went to the neighbors for help. They found that the bull was gone from its stall and the neighbors, armed with lanterns and guns, followed tracks which led to a woodlot about twenty-five rods from the barn. There they found the bull standing over the dead man, a long rope tangled around some trees and bushes holding it fast, and they shot it with a rifle. Evidently Mr. Black had led the bull to the woodlot for water and exercise."

Another fatal result of leading a bull by a rope. Last fall we visited a big farm where over forty dairy-bred bulls were in service and found the attendants leading them around on the end of a rope, without staff or any other protection. Some day we expect to hear that one of these gentle bulls has hurt or killed somebody. From an account of Mr. Black's murder sent us by W. J. Geary of Clarion, Pa., we learn that this bull had been considered gentle. Most of the fatal bulls are so rated until they kill somebody.

FROM BAD TO WORSE

LAST week the wheat market made new low-price records for the current crop year. As this is written the price is over 50c per bushel below the year's high mark. While Europe will probably need more wheat during the balance of the year, which ends with June, nothing now in sight indicates a sufficient reduction in the supplies of this country and Canada. Crop damage may change the outlook materially, so may unfavorable seeding conditions in spring wheat territory, and these are likely to be the most important market influences in the near future.

It is assumed that the Stabilization Corporation has bought a large quantity of wheat; and the market has declined in the face of such purchases. Probably the current estimates of the Corporation's buying are high

enough or too high. For the sake of all concerned the operations of the Corporation should be made public. It is an institution established by a public agency and financed by public funds. For this reason as well as for sound commercial reasons its transactions should be published just as promptly consistent with correct information. The wheat market has to contend with plenty of uncertainties without any unnecessary incident to the operations of the Grain Corporation.

THE REDUCERS

THOSE who are preaching reduction in production are correct in saying such a course would probably enhance the value of the individual farmer's product. But if they view the matter from the point of the individual farmer they will find it so easy to tell him just what to do it is to tell farmers collectively what to do. It's not easy for a farmer to change an established rotation, to shift from one to another or to allow land to remain idle while he pays taxes and possibly interest. Yet some such things must be done if farmers are to follow the counsel to reduce production. What then becomes of the trine of efficiency in production whereby farm plant is operated to capacity? It will happen to the markets for other commodities if the farmer reduces the acreage and grows more of others? What of the warning and the same counsel is applied to practically all staples by official advisers. Farmers should study production from all angles, including the mentioned; but as a rule they will find profit in studying economical production less production.

A FREE FAIR

RUN on the old and usual basis the lawha county, W. Va., fair was successful from either a financial or an educational standpoint. The latter was the which County Agent T. Y. McGowan most concerned. So he proposed that which is in reality a joint or cooperative organization, should be made into a free without any charge for admission but of 25c for parking and 25c for admission to the grandstand. For several years his efforts were without effect; but he finally succeeded in guaranteeing good returns as the fair held on the old basis and his plan adopted. It was a success from the standpoint of attendance is limited only by the capacity of the grounds. The revenues from commercial exhibits exceed anything ever realized. Admission fees. As an educational institution the fair is more powerful than ever before. It has the support of all interests and is tended by all who can get to it. Mr. McGowan is very modest about his part in the development but he has every reason to be proud of it. Maybe some other fair is struggling along without getting where could profit by studying this fair.

CATTLE TARIFF

ONE of the changes resulting from Senate's labors with the agricultural tariff schedule last week was an increase in the duty on live cattle. As the Senate now stands it imposes a tariff of 2 1/2 pounds on cattle weighing less than 700 pounds and 3c per pound on those weighing 700 pounds or more. There are several reasons from which to view and question the effect of this increase. One of them is the price of the feeder who needs cattle and like Canadian kind. He asks why his supply should be cut off by a high tariff. When Canada can furnish thin cattle and country can finish them, and both may thereby, why prohibit the trade by exacting tariff rates?

Pennsylvania Farm Comment

By MILES HORST

THE compulsory clean-up for corn-borer control in Pennsylvania will be limited to York and Crawford counties. Last year Mercer was included and two years ago Lawrence, Warren and Butler counties. These last four counties named have been omitted from this year's registration because the borer infestation was reduced to a very low degree of infestation. Erie and Crawford have reduced their infestation too but there still remains enough to be dangerous unless these clean-up measures are carried out on all corn growing farms within their borders.

THE fact that only two counties in this state this year are included in the compulsory clean-up does minimize the importance of having farmers in other twenty counties where the borer is known to exist clean up their corn stalks as well. A voluntary effort is made in these counties keep the borer down, the time will come when general compulsory clean-up must again be extended.

THOUSANDS of bushels of seed potatoes will be bought by growers in this state during the next four or six weeks. Some of this seed stock will be of an exceptionally good quality. Some of it will be very ordinary. But the difference in price will be rather small, least not in line with the difference in quality.

THE best seed comes from the northernmost sections of the country or from sections of high altitude. It is selected by producers who select their strains of vigor and prolificacy who during the growing season guard all plants that do not show vigor or that show any trace of disease. It is carefully guarded against frost damage and bruising. A fair grade of seed can be obtained from most sections of this state from those that were planted with seed of the best selected stock the year before, and well cared for by the grower. But stock coming from seed grown in our section for more than a year must be regarded as poor. A large number of demonstrations prove the reliability of different grades of seed stock have been conducted in this state. The results of these are in the possession of county agents who are more than glad to advise growers as to sources of good seed in line with the knowledge we today have. If you are not sure about the quality of the seed you want to purchase consult your county agent.

PUBLIC spirited citizens of York, Pa., are proposing to plant the rose along the Lincoln highway running east and west across York county. Not to be outdone by these citizens of the "White Rose" city, folks in Lancaster known as the "Red Rose" city, propose to plant red rose along the same highway which also crosses Lancaster county.

THE spirit of these southern tier Pennsylvania citizens is in line with a general desire on the part of our people to make our highways not only arteries for the convenience of people but avenues of rural beauty as well. Public sentiment is ready to back the carrying out of a general highway beautification program for this state.

SUCH a program is not a simple one, however. Data for the purpose must be selected that will turn wild and become a nuisance on nearby farm land. If trees are to be used, interference with overhead electric and telephone lines must be considered. There are stretches of open country which in themselves are pleasing and should not be shut off by planting along highways. A program of highway beautification calls for far-sightedness and judgment in its planning.

WHAT constitutes a Successful Farmer," and "Getting Light and Power to the Farmer" were the two leading topics discussed at the annual meeting of the Schuylkill County Extension Association held at Pottsville February 15th.

John Schroepe, a master farmer of the county, outlined a successful farmer's qualifications as he presented them under the following five heads: 1. From the business standpoint, a successful farmer must show profit and bills against it must be paid promptly. 2. The successful farmer should maintain his land in such a manner so as to leave it as good or better than it was when he took charge of it. 3. He should provide and maintain modern buildings and equipment. This includes a home with

modern conveniences, particularly a heating system, running water and electricity. It also includes good farm equipment so essential in these days of keen competition.

4. He should have a good home, not so much in the sense of material things but rather in the spiritual and cultural phases of that home. There should be a father, mother and children in the home with music, books, magazines and radio.

5. He should have community spirit, that is, be interested in problems of the community in the way of good roads, good schools and better churches. He should be sufficiently interested in the administration of his township or borough to go to the polls regularly to vote.

John M. McKee, Executive Secretary of the Pennsylvania Joint Committee on Rural Electrification, told these farmers that the first thing to consider in approaching this rural electrical problem is to determine what electricity is worth

Mushing On

to them through the saving of labor by adequate lighting and by motors through the saving of fuel where electricity replaces coal or oil for cooking and lighting. Electricity has value in producing better products to sell as in the cooling of milk. It makes a water system possible in the home.

It was explained that service is taken out to rural applicants at the electric company's expense with current furnished at the same rate per K. W. H. as in town, provided the applicants will accept an adjusted minimum based on 2 per cent per month on the cost of the extension divided among the applicants in whatever amounts they agree to pay. There is also the fullest opportunity given for cooperation where the applicants may contribute labor such as pole hauling, hole digging and tree trimming which will be credited at the company's cost for doing the job and their minimum reduced proportionately.

Representatives of the electrical company serving Schuylkill county were present and said their companies were ready to extend lines and asked that farmers cooperate in ironing out a number of difficulties both groups are still facing. On a showing of hands, it was evident that farmers in Schuylkill county want electricity.

SOME four hundred farmers and their wives attended the all day session of the Lancaster County Extension Association held at Lancaster, February 19th.

R. W. Dunlap, National Assistant Secretary of Agriculture, addressed the group in their joint session with the Lancaster Chamber of Commerce at a luncheon held at the Brunswick Hotel. Secretary Dunlap did not assume the cloak of an alarm-

ist or of an ardent optimist, but rather pointed to the sensible fact that after all the farmer's great problem in this state is cutting his costs of production and in that field lies his greatest hope of increasing his returns. He called attention to the fact that farmers here and all over the country are paying more than their fair share of taxes. He advised Lancaster county tobacco growers to organize and join other tobacco growers' associations in the country.

Following the luncheon, the farmers and their wives listened to reports of the many projects carried on in the county under the direction of the extension service. Miss Anna Keller told of the canning and garment clubs having a membership in the county of 190 girls. Clarence Garber told of the activities of the 140 boys and girls enrolled in last year's corn club, while the Guernsey calf club boys put on a demonstration emphasizing the health features of milk, cheese and butter.

The Lancaster County Herd Improvement plan was discussed by Mr. Groff. Last October the association which follows a short cut system of keeping milk records reorganized with 119 herds having 1,700 cows enrolled. The total expense of testing these cows during the year was \$1,367.

Harry Houser told of his method of keeping farm accounts and the importance of doing so. Elmer Snyder praised the college spray service and advised all fruit growers to take advantage of it.

In this short space we cannot give full details of the meeting, but one thing was outstanding. Of those who took part in it, probably twenty in number, at least 75 per cent were under 40 years of age. Surely a county that challenges its youth to the leadership of its greatest industry need not fear or worry about the future.

The following were elected to direct the work of the association for the coming year: C. B. Snyder, Dr. F. A. Achey, Wm. Bucher, Abner Risser, H. S. Nolt, D. M. Landis, H. H. Snavely, Mrs. Geo. Haverstick, and Mrs. J. C. Reist.

THE Mexican bean beetle can be controlled without much trouble provided bean growers follow a systematic program of control. Dr. E. N. Cory, entomologist at the University of Maryland, told the Maryland canners last week that spraying in large fields is more effective than dusting in the control of the beetle, but that in the case of small patches dusting is more convenient.

The spray recommended in Maryland is magnesian arsenate in water applied through the regular sprayers used on potatoes and vegetables. The dust recommended consists of 20 per cent calcium arsenate, 20 per cent monohydrated copper sulphate and 60 per cent hydrated lime. Dr. Cory also

brought out the fact that disking infested ground before plowing has been found in many cases to reduce the infestation.

THE Holstein cow with a window in her side standing in the Penn State dairy barn during the past three years died last week. The opening into her stomach was made that the Penn State scientists might study the processes of digestion taking place within her. In the opening a shutter was placed so that the stomach might be opened and closed as desired.

It was learned that the cow can manufacture her own vitamin B in the rumen when her feed contains none of the vitamin. New forms of bacteria were discovered in this cow's stomach which were not known before. Many other mysteries were clarified by this direct contact with the processes taking place in a normal functioning animal's stomach.

PRELIMINARY estimate of the acreage of potatoes already planted and to be planted in the states from Texas and Florida north to and including Virginia this spring, according to the U. S. Department of Agriculture, is 223,250 acres. This is about the same acreage these states planted in 1926, is less than they planted in 1927 and 1928, but about 8 per cent more than they planted in 1929 when the actual acreage was estimated to be 196,410 acres.

R. G. BURTNER, county agent of Dauphin County since 1923, has resigned from his present position, effective March 1, to enter into the insurance business.

TO PROTECT SHIPPERS

LAST week the House Committee on Agriculture held hearings on the Summers bill (House bill 5663), which provides for federal licensing of dealers, commission merchants and brokers in perishable fruits and vegetables. Several states now have laws of this nature but they are inadequate because so much of this business is inter-state. There is great objection, and properly, to the extension of federal control of business; but that should not stand in the way of this legislation for the protection of shippers who cannot be protected in any other way.

COMMERCIAL CATTLE SHOW

CATTLEMEN in eastern feeding territory will be glad to learn that the Lancaster Fat Cattle Show will be held June 18-19, with the prospect of being better than ever. This show is unique in one respect—the cattle competing for prizes must have been bought as feeders at the Lancaster stockyards. This is the biggest show of purely commercial cattle in the country and it furnishes plenty of evidence of the skill of eastern feeders.

THE OLD PLAN

LAST October the wool producers of Australia attempted to maintain the price by restricting the amount offered. That appeared to be successful for a time. But the wool had to go to market sometime and when it went in large volume it had the inevitable effect. Now a system of control similar to the British-Australian Wool Realization Association is being discussed, but with little prospect of adoption. The best thing to do with the Australian surplus is to follow the old plan of getting it used up and out of the way, incidentally stimulating the use of it by all legitimate means. Fortunately fashion is again tending toward increased use of wool, and that will probably do more than all the schemes to restrict production, to limit selling or to control price through government action or official agencies.

FERTILIZER ON GRASS

THE effect of plant food on pastures, not only in regard to the extra amount of grass produced but also in regard to the nutritional properties of that grass, has been the subject of study by scientists and fertilizer interests. The results of such study indicate that a cow on pasture may have a full stomach and yet not get enough of some things to

supply her system, resulting in malnutrition and attendant ills. This is in line with practical experience and observation, which have been that cattle in certain places do better than in other localities, presumably because they get the needed minerals, vitamins or other substances. Whether it be done for the extra amount of grass produced or for the addition of some more or less mysterious ingredients in that grass the fertilization of pasture is generally profitable. It merits attention because of the probable deficiency of land from which generations of animals have carried something away and because of the importance of pasture in the successful management of most livestock.

FROM LIFE

FOR several years, back in the last decade, a certain breeder of pure-bred cattle held a successful annual sale. Each year he went out and bought a number of cattle because he had not enough of his own to make an attractive offering. As prices were advancing all the time he made plenty of money on what he bought and what he bred, so he decided to make a big sale and bought plenty of cattle for it. But before sale day came the boom in cattle collapsed. He had to sell his costly cattle at a heavy loss. Some men who owed him for stock bought at earlier sales were unable to pay their notes. Instead of being independent as he expected he barely escaped bankruptcy. As a breeder he would have made good money while the boom lasted and would have had little actual loss when it busted. As a speculator he merely went too far, as most speculators do sometime.

A LED BULL

THIS time let us quote from a letter written us by J. F. Wyant, Crown, Pa.:

"Charles A. Black, farmer, granger and highly respected citizen living near North Pine Grove, Pennsylvania, was gored to death February 18 by his five-year-old registered Guernsey bull. He and his twelve-year-old daughter lived together, the mother being dead. When the child came home from school she could not find her father and went to the neighbors for help. They found that the bull was gone from its stall and the neighbors, armed with lanterns and guns, followed tracks which led to a woodlot about twenty-five rods from the barn. There they found the bull standing over the dead man, a long rope tangled around some trees and bushes holding it fast, and they shot it with a rifle. Evidently Mr. Black had led the bull to the woodlot for water and exercise."

Another fatal result of leading a bull by a rope. Last fall we visited a big farm where over forty dairy-bred bulls were in service and found the attendants leading them around on the end of a rope, without staff or any other protection. Some day we expect to hear that one of these gentle bulls has hurt or killed somebody. From an account of Mr. Black's murder sent us by W. J. Geary of Clarion, Pa., we learn that this bull had been considered gentle. Most of the fatal bulls are so rated until they kill somebody.

FROM BAD TO WORSE

LAST week the wheat market made new low-price records for the current crop year. As this is written the price is over 50c per bushel below the year's high mark. While Europe will probably need more wheat during the balance of the year, which ends with June, nothing now in sight indicates a sufficient reduction in the supplies of this country and Canada. Crop damage may change the outlook materially, so may unfavorable seeding conditions in spring wheat territory, and these are likely to be the most important market influences in the near future.

It is assumed that the Stabilization Corporation has bought a large quantity of wheat; and the market has declined in the face of such purchases. Probably the current estimates of the Corporation's buying are high

enough or too high. For the sake of the operations of the Corporation it should be made public. It is an institution established by a public agency and financed by public funds. For this reason as well as for sound commercial reasons its transactions should be published just as promptly and consistently with correct information. The wheat market has to contend with plenty of uncertainties without any unnecessary incident to the operations of the Corporation.

THE REDUCERS

THOSE who are preaching reduction in production are correct in saying such a course would probably enhance the price of the individual farmer they point out. But if they view the matter from the point of the individual farmer they find it so easy to tell him just what to do it is to tell farmers collectively what to do. It's not easy for a farmer to get an established rotation, to shift from one to another or to allow land to remain idle while he pays taxes and possibly interest. Yet some such things must be done if farmers are to follow the counsel to reduce production. What then becomes of the trine of efficiency in production where a farm plant is operated to capacity? It will happen to the markets for other commodities if the farmer reduces the acreage and grows more of others? What of it? For the same warning and the same counsel is applied to practically all staples by official advisers. Farmers should study production from all angles, including the mentioned; but as a rule they will find profit in studying economical production less production.

A FREE FAIR

RUN on the old and usual basis the rawha county, W. Va., fair was a success from either a financial or an educational standpoint. The latter was the which County Agent T. Y. McGowan most concerned. So he proposed that which is in reality a joint or cooperative organization, should be made into a free without any charge for admission but of 25c for parking and 25c for admission to the grandstand. For several years his efforts were without effect; but he finally managed to guarantee as good returns as the fair held on the old basis and his plan adopted. It was a success from the start. Attendance is limited only by the capacity of the grounds. The revenues from commercial exhibits exceed anything ever realized from admission fees. As an educational institution the fair is more powerful than ever before. It has the support of all interests and is tended by all who can get to it. Mr. McGowan is very modest about his part in the development but he has every reason to be proud of it. Maybe some other fair is struggling along without getting anywhere where could profit by studying this experience.

CATTLE TARIFF

ONE of the changes resulting from Senate's labors with the agricultural tariff schedule last week was an increase in the duty on live cattle. As the Senate now stands it imposes a tariff of 25c per pound on cattle weighing less than 1000 pounds and 3c per pound on those weighing 700 pounds or more. There are several points from which to view and question the wisdom of this increase. One of them is the price of the feeder who needs cattle and livestock of the Canadian kind. He asks why his supply should be cut off by a high tariff. When Canada can furnish thin cattle and country can finish them, and both may thereby, why prohibit the trade by excessive tariff rates?

March 1, 1930

THE compulsory clean-up for corn-borer control in Pennsylvania this year will be limited to Erie and Crawford counties. Last year Mercer was included and two years ago Lawrence, Warren and Butler counties. These last four counties named have been omitted from this year's registration because the borer infestation was reduced to a very low degree of infestation. Erie and Crawford have reduced their infestation (so) but there still remains enough to be dangerous unless these clean-up measures are carried out on all corn growing farms within their borders.

The fact that only two counties in this state this year are included in the compulsory clean-up does minimize the importance of having farmers in other twenty counties where the borer is known to exist clean up their corn stalks as well. A voluntary effort is made in these counties to keep the borer down, the time will come when general compulsory clean-up must again be extended.

THOUSANDS of bushels of seed potatoes will be bought by growers in this state during the next four or six weeks. Some of this seed stock will be of an exceptionally good quality. Some of it will be very ordinary. But the difference in price will be rather small, at least not in line with the difference in quality.

The best seed comes from the northernmost sections of the country or from sections of high altitude. It is selected by producers who select their strains of vigor and prolificacy who during the growing season guard all plants that do not show vigor or that show any trace of disease. It is carefully guarded against frost damage and bruising.

A fair grade of seed can be obtained from most sections of this state from those that were planted with seed of the best selected stock the year before, and well cared for by the grower. But stock coming from seed grown in our section for more than a year must be regarded as poor. A large number of demonstrations have proved the reliability of different grades of seed stock have been conducted in this state. The results of these are in the possession of county agents who are more than glad to advise growers as to sources of good seed in line with the knowledge we today have. If you are not sure about the quality of the seed you want to purchase consult your county agent.

PUBLIC spirited citizens of York, Pa., are proposing to plant the rose along the Lincoln highway running east and west across York county. Not to be outdone by these citizens of the "White Rose" city, folks in Lancaster, known as the "Red Rose" city, propose to plant a red rose along the same highway which also crosses Lancaster county.

The spirit of these southern tier Pennsylvania citizens is in line with a general desire on the part of our people to make our highways not only arteries for the convenience of people but avenues of rural beauty as well. Public sentiment is ready to back the carrying out of a general highway beautification program for this state.

Such a program is not a simple one, however. For the purpose must be selected that will turn wild and become a nuisance on nearby land. If trees are to be used, interference with overhead electric and telephone lines must be considered. There are stretches of open country which in themselves are pleasing and should not be shut off by planting along highways. A program of highway beautification calls for far-sighted skill and judgment in its planning.

WHAT constitutes a Successful Farmer, and "Getting Light and Power to the Farmer" were the two leading topics discussed at the annual meeting of the Schuylkill County Extension Association held at Pottsville February 15th.

John Schoppe, a master farmer of the county, outlined a successful farmer's qualifications as he presented them under the following five heads: 1. From a business standpoint, a successful farmer must show profit and bills against it must be paid promptly. 2. The successful farmer should maintain his land in such a manner so as to leave it as good or better than it was when he took charge of it. 3. He should provide and maintain modern buildings and equipment. This includes a home with

SOME four hundred farmers and their wives attended the all day session of the Lancaster County Extension Association held at Lancaster, February 19th.

R. W. Dunlap, national Assistant Secretary of Agriculture, addressed the group in their joint session with the Lancaster Chamber of Commerce at a luncheon held at the Brunswick Hotel. Secretary Dunlap did not assume the cloak of an alarm-

Pennsylvania Farm Comment

By MILES HORST

modern conveniences, particularly a heating system, running water and electricity. It also includes good farm equipment so essential in these days of keen competition.

4. He should have a good home, not so much in the sense of material things but rather in the spiritual and cultural phases of that home. There should be a father, mother and children in the home with music, books, magazines and radio.

5. He should have community spirit, that is, be interested in problems of the community in the way of good roads, good schools and better churches. He should be sufficiently interested in the administration of his township or borough to go to the polls regularly to vote.

John M. McKee, Executive Secretary of the Pennsylvania Joint Committee on Rural Electrification, told these farmers that the first thing to consider in approaching this rural electrical problem is to determine what electricity is worth

fair share of taxes. He advised Lancaster county tobacco growers to organize and join other tobacco growers' associations in the country.

Following the luncheon, the farmers and their wives listened to reports of the many projects carried on in the county under the direction of the extension service. Miss Anna Keller told of the canning and garment clubs having a membership in the county of 190 girls. Clarence Garber told of the activities of the 140 boys and girls enrolled in last year's corn club, while the Guernsey calf club boys put on a demonstration emphasizing the health features of milk, cheese and butter.

The Lancaster County Herd Improvement plan was discussed by Mr. Groff. Last October the association which follows a short cut system of keeping milk records reorganized with 119 herds having 1,700 cows enrolled. The total expense of testing these cows during the year was \$1,367.

Harry Houser told of his method of keeping farm accounts and the importance of doing so. Elmer Snyder praised the college spray service and advised all fruit growers to take advantage of it.

In this short space we cannot give full details of the meeting, but one thing was outstanding. Of those who took part in it, probably twenty in number, at least 75 per cent were under 40 years of age. Surely a county that challenges its youth to the leadership of its greatest industry need not fear or worry about the future.

The following were elected to direct the work of the association for the coming year: C. B. Snyder, Dr. F. A. Achey, Wm. Bucher, Abner Risser, H. S. Nolt, D. M. Landis, H. H. Snavely, Mrs. Geo. Haverstick, and Mrs. J. C. Reist.

THE Mexican bean beetle can be controlled without much trouble provided bean growers follow a systematic program of control. Dr. E. N. Cory, entomologist at the University of Maryland, told the Maryland canners last week that spraying in large fields is more effective than dusting in the control of the beetle, but that in the case of small patches dusting is more convenient.

The spray recommended in Maryland is magnesium arsenate in water applied through the regular sprayers used on potatoes and vegetables. The dust recommended consists of 20 per cent calcium arsenate, 20 per cent monohydrated copper sulphate and 60 per cent hydrated lime. Dr. Cory also brought out the fact that diking infested ground before plowing has been found in many cases to reduce the infestation.

THE Holstein cow with a window in her side standing in the Penn State dairy barn during the past three years died last week. The opening into her stomach was made that the Penn State scientists might study the processes of digestion taking place within her. In the opening a shutter was placed so that the stomach might be opened and closed as desired.

It was learned that the cow can manufacture her own vitamin B in the rumen when her feed contains none of the vitamin. New forms of bacteria were discovered in this cow's stomach which were not known before. Many other mysteries were clarified by this direct contact with the processes taking place in a normal functioning animal's stomach.

PRELIMINARY estimate of the acreage of potatoes already planted and to be planted in the states from Texas and Florida north to and including Virginia this spring, according to the U. S. Department of Agriculture, is 223,250 acres. This is about the same acreage these states planted in 1926, is less than they planted in 1927 and 1928, but about 8 per cent more than they planted in 1929 when the actual acreage was estimated to be 196,410 acres.

Mushing On

Option's Ima Daytonia, "an educated cow," is one of the four Jerseys in the United States that has four gold medals for high milk and butterfat production. She is owned by Pennsylvania State College.

The Education of the Cow

By A. A. BORLAND

A STARTLING change has taken place in the status of the dairy cow during the past century. Cows during the early history of this country freshened in the spring, gave a small amount of milk during the summer, went dry in the fall and frequently starved to death in the winter. At present an even hundred cows have each produced an average of over 38 quarts daily for a year and one cow has a yearly average of 47.6 quarts daily.

What has brought about this amazing change? It appears to me that it might be attributed largely to the "education" of the cow. Education, according to Webster, consists of "the knowledge, training or ability gained either by a system of study and discipline or by the experiences of life."

A few of the subjects that should be included in the course of study for every well educated cow are here presented for the consideration of the readers of The Pennsylvania Farmer.

Diet is the first subject which every cow, ambitious for an education, should study. On every hand we hear the terms, protein, carbohydrates, fat, fiber, minerals, calories, therms, vitamins, nutritive ratio, balanced ration, etc. In the race for efficiency a cow is soon lost without some first-hand knowledge of diet.

A Balanced Ration

How essential this is may be noted from the experience of the cows at the University of Illinois. Two groups of cows furnished the information. One group ate an unbalanced ration consisting of corn, timothy hay, clover hay and silage, the nutritive ratio being 1:11. The other group received a ration in which part of the corn was replaced by gluten feed and the timothy hay by clover hay, the nutritive ratio being 1:6.

At the beginning of the experiment the balanced ratio group was producing 1.7 pounds more milk per cow than the unbalanced group. During the first week of the trial the increase was 5.8 pounds of milk daily for each cow of the balanced ration group and in the seventh week the gain was 13.2 pounds of milk daily for the balanced ration group. The cows receiving the balanced ration were also in better physical condition at the end of the trial than those receiving the unbalanced ration.

A second subject that all cows ought to study is efficient milk production. Sometime ago I read a book entitled "Taylor's System of Efficient Plant Management." Time studies were conducted to determine just how long it ought to take a fairly skillful workman to do a particular piece of work. The employees were then paid a certain amount per piece so that a skillful man could make a good day's wages. Unskilled men were taught how to do the work with the fewest possible motions and the least expenditure of effort and time.

How many dollars' worth of milk should a cow get from a ton of good clover hay? Some cows are efficient enough to get \$50 or more; others are so inefficient that they cannot get \$5. A dairyman should check the efficiency of his cows by actual records of milk yield and feed eaten such as are kept by a cow-testing association. A cow that cannot make the grade in efficient milk production should be given an opportunity to resign her place in the dairy herd and seek a more appropriate position on the meat block of the butcher shop.

Another subject which cows should consider is eugenics. What a lot of disappointment concerning her sons and daughters a cow would often be spared if she were more particular about the character and family history of the father of her children. "Like father like son" is an old adage that holds as well in the bovine world

This pure-bred Guernsey, Imp. Victor's Dandy Deanie, has been "educated" to the point where she produced 9,694.3 pounds milk and 520.8 pounds of butterfat in a year, making her the state champion in her class, which is DDD of the American Guernsey Cattle Club, Advanced Registry. She is owned by C. A. Lyon of Franklin county, Pa.

the elimination of reactors. There is an outbreak occasioned, it is said, by a purchased animal which proved to be a reactor, nearly the whole herd lost in 1916-17. After the stables had been thoroughly disinfected other cows were purchased to take the place of those lost. Each was purchased subject to test, was quarantined 60 days and retested before entering the main herd. The result is that a single diseased animal has not been found since 1917 and the herd has been federally accredited as free from tuberculosis since 1919. Many other herds have had a similar experience. Pennsylvania is one of the foremost states in the elimination of bovine tuberculosis.

Contagious abortion is another disease that demands special attention. When a cow aborts or freshens prematurely she yields only two-thirds to three-fourths as much milk as a normal calf is often dead or so weak that it does not survive and frequently the cow becomes sterile. The Connecticut Station found that about one cow in ten has had a contagious abortion. What we should do is cow annually than nonreactors.

Fortunately the same general principle is used in the elimination of bovine tuberculosis. The agglutination test for the detection of the disease and their separation from the healthy herd is proving a successful method of control.

College Experience

The College herd has also contributed its share of experience along this line. When first tested in 1926 about 40 per cent of the cows reacted to the agglutination test. Since January, 1928, when reactors were isolated there has been practically no trouble in the clean herd numbering 185 pure-bred animals.

There has recently been "much ado" about the possibility of humans contracting undulant fever from the same organisms causing abortion in cattle. As a matter of fact there are comparatively few cases of undulant fever and the danger has been exaggerated, as most milk is now pasteurized and pasteurization kills any of the brucella abortus organisms that might be present. Nevertheless, dairymen producing raw milk for fluid consumption will do well to get in touch with the Pennsylvania Bureau of Animal Industry, Harrisburg, with a view to the elimination of aborting reactors.

No cow education is complete without a course in sanitation. Clean milk creates a demand for more milk. Four simple rules will do it:

(1) A clean cow and a clean dry hand milker. The cow ought to be brushed off daily and her udder and flanks wiped with disinfectant before milking. (2) A hooped milk pail. (3) Sterilized utensils. (4) Prompt and thorough cooling. Bacteria multiply with frightful rapidity under favorable conditions. One may have a million descendants in twenty-four hours. Low temperatures check multiplication. The milk should be cooled immediately after milking to a temperature below 45 degrees F.

After a cow has produced a high quality milk at low cost it is in order to complete her education with a course in organized milk marketing. Much progress is being made in this respect. A majority of cows in the eastern states now market their milk through such agencies as the Dairy Men's Cooperative Sales Company, Pittsburgh; the Philadelphia Interstate Dairymen's Association; the Dairymen's League; or local cooperative milk plants; rather than each cow selling her own milk independently in ruinous cut-throat competition with every other cow in the community.

Fifty years ago cows were compared to a pig. (Continued on page 26.)

Junior Farmers Teach Celery Growing

By WALTER L. BOLLINGER

BOYS' and girls' club work has many elements to justify its existence, but in Schuylkill county, Pa., no phase of it is used to better advantage than when it serves as a medium of introducing desirable crops where none grew before. It is in this sense that club work has been the means of interesting certain farmers in celery growing in a county where the demand is large and the local supply practically nil.

Story after story is being written of boys' and girls' club work and the good it does in teaching better methods of farming, better care of livestock and better living in the open country. Yet few of us can estimate the sum total of the part it is playing in the evolution, or shall I say revolution, in agriculture. Certain it is that junior club work is the biggest single educational institution in country life today aside from the schools and the churches. The wise parents will encourage it, and whenever possible, opportunity should be given the children to enter some form of club work.

In the past we extension workers have not always pointed our club activities in the right direction. We have frequently advocated or allowed communities to select types of club work which were not adapted to the community. For example, it is useless to encourage pig feeding clubs in communities where no corn is grown. It is folly to advocate dairy club work in vegetable growing communities where nobody wants to milk a cow. What we should do is select crops or livestock that fit into the community, or have possibilities which perhaps the community has overlooked.

Here in Schuylkill county we have a population of 220,000 people with a relatively small farm population. This provides a market for all sorts of foods in greater quantity than is produced locally. While the county has no large cities it has the car-marks of a metropolitan district. Vegetables are grown nearby and are in big demand, while such products as milk have until recently been almost entirely shipped in from nearby counties.

On the whole our farmers are growing enough for more than enough of the stable vegetables in season. Human nature is the same here as everywhere, and farmers cling to the crops of twenty years ago very tenaciously but are slow to meet the demands for the finer and more popular crops such as asparagus, spinach, lettuce and celery. There are carloads of these vegetables consumed in the county during the season, but it is most difficult to find many farmers who have been growing any of the crops named above for market.

Only here and there can such men be found. We understand perfectly well that our soil is not a natural vegetable soil as is found in New Jersey, and we know that we cannot grow iceberg lettuce in our climate. Yet there is ample evidence that even if growing conditions for most of these crops are not ideal marketing conditions are exceptional.

With a knowledge of the above production and marketing situation at hand, and with the further knowledge that vegetable consumption is increasing more rapidly than the population, boys' and girls' celery clubs have been organized in various points of the county to introduce a crop which is scarcely grown.

If the boys and girls could prove that celery growing is practical and profitable in the county then it should be an easy matter to interest the parents. That was our supposition and it proved to be correct.

In organizing a celery club we have been using just 500 celery plants to a boy or a girl. They are grown by commercial plant growers and delivered to the member at \$3 for the 500. Celery of the Easy-blanching variety is grown, as it proved to be a more vigorous grower than the nationally known Golden Plume variety.

The plants are set out six inches apart in the row and about thirty inches between rows. Planting is done on the level and not in trenches. The more humus in the soil and the more moisture, the better it is for the celery. The celery is set out from July 15th to August 1st, and is kept growing as late in the fall as weather permits. Blanching, on a small scale, is done with boards.

The more successful growers watered their celery several times during the season. A few irrigated the small plot with a hose, though this is not practical on most farms nor necessary in normal years. There is no question, however, that water is the biggest factor in successful celery growing and that if much is grown, some form of irrigation should be available.

Each year we find some failures and some outstanding successes. Usually the farms where the parents are good truckers produce good celery.

W. B. Nissley, specialist in vegetable growing, inspects celery field of Ethel and Howard Mengel.

The successes have been frequent enough and outstanding enough to induce the parents who never before grew celery to grow some themselves. That is the best proof of the value of club work.

In our several years' experience with celery in the county no better celery was grown and marketed than that grown last season by Marion and Minnie Gauker of Cressona. They together set out a total of 1,000 plants in July. A short while before Christmas they completed their marketing. The complete records show receipts of \$96.33 or almost an average of 10c per stalk. Most of it was sold retail. A part was sold wholesale at \$1.20 per dozen stalks. The retail price ran as high as 20c per stalk with a few stalks selling at 25c. This was

Stella, Nelson and Donald Bensinger. Donald, the youngest of the trio, was substituting for his brother LeRoy, who was in school.

one of the most profitable club projects ever conducted in the county.

The farmers have spoken much of the quality of their home-grown celery. It was very fine to find the farmers satisfied, but what did the consumer think of it? This was very easily determined after visiting a few customers and the stores which handled some of the celery. The answer to the question "How did you like the club celery?" was found in the smile of those questioned. The answer was universal: "Wonderful, but it is all gone. We can't get any more."

It is up to the farmers to get more next season and in years to come. In the meanwhile, we have a lot to learn in selecting the right variety of celery, in finding the best methods of growing, and in storing some celery properly for early winter sales. It is a worthy project which got its start through boys' and girls' club work.

Care of Shrubs

A LOT of the farm homes in the country that have roses or flowering shrubs around the doors and yards have them covered with oyster shells or other scale insects. A good time to clean up these bushes is in March by giving them a spray of one of the commercial oil sprays now on the market. These have greater penetrating powers than lime sulphur and most of them if you do a good job will do a good job themselves.

If you haven't a sprayer available, dilute according to directions and take a paint brush or whisk broom and paint your shrubs, but be sure to cover all sides of them with the oil preparation. Don't use any stronger than the manufacturer recommends. In fact, it wouldn't hurt if you diluted a little more, for too much oil might harm your bushes somewhat.

This is a good time of the year also to prune shrubs and roses. It won't hurt to cut roses back hard except the climbers, but the shrubs that flower early should not be sheared off, only thinned out and the old wood removed. If you want to cut them back, wait until after they have flowered, say the last of May or first of June. Those that flower from June on may be pruned any way you like but the early bloomers have already set their buds and if you cut away too hard you cut flowers.

Mercer county, N. J.

A. C. McLean.

The Robber Lawn

OUR farm like many others in the same community boasted a big lawn. We had the customary lilac bush with hundreds of young sprouts about it, snowballs, snaggy apple trees, a walnut, half a dozen sickly cherry trees that had not had a crop for years, spirea, syringia, peonies, iris, flower beds, little evergreens and all scattered haphazard after the old-fashioned idea of landscaping, and some really good maples.

But nearly two acres front and back were not only robbing us of income, but a forlorn nuisance to keep clean and tidy. So we boldly laid the axe at the root of the worthless trees, turned the back yard into a vegetable garden and cut off the sides of the front lawn in spite of the predictions of our friends that we would ruin everything. It took some nerve, I'll admit, to slaughter ruthlessly, and move what we wanted to save up close to the house, for my father and mother had planted many of the sickly old shrubs and fruit trees.

But it worked! Everybody says we did the farm a thousand dollars worth of good by having a general cleaning up. The transplanted flowers of my parents are doing better in the new sunny garden than ever before, and there is a good income from the robber acres. More than that, the lawn is small enough not to be a nightmare to mow.

We do not mean that we should denude a place of beauty or make a change which detracts from the appearance of the home, rather the opposite, for the improvement should always be carried out with thought and sympathy. Proper arrangement and intelligent choice of materials are as important in the layout of home grounds as anywhere else. But today we do not have the time or the space in any places that were so common formerly. The important thing was that we combined beauty with economy of land and labor.

Economist.

THE long-boat might have succeeded in beating a safe retreat if it had not run into a pod of sleeping wild-fowl. The rustling clatter of wings betrayed their position as plainly as if a searchlight had been thrown on them, and drawing in his oars, Bartlett lifted a rifle from under a bundle of oilskins in the stern.

"Steady, boys," he ordered. He listened an instant to the sound of the oncoming motor-boat and fired.

"I reckon they won't try to run us under now," he commented grimly.

"Did you hold on them?" asked Toots with an unsteady voice.

"What d'you think?" Bartlett laughed roughly as he expelled the empty shell from the magazine. "I'll wing one of the cusses, too, next time."

Suddenly the motor-boat opened fire. A hail of bullets whirled past with vicious whinnings. There was another sound, distinct but low, the unmistakable sound of a ball striking flesh, and Crumb dropped his oars with a gasp of pain.

"Got me!" he said with a kind of dazed wonder. With their best oarsman crippled there was no doubt now that the jig was up.

But Bartlett was not the sort to stand by his friends and take their medicine with them if desertion held out a chance to save his own skin. With cowardly quickness he grasped the tough sedge rimming the marsh wall against which they had drifted, and pulled himself up. Before the others had time to perceive his intention he was off, lost instantly in the misty darkness, the noise of his splashing footfalls floating back indistinctly to their ears.

Where Bartlett could go they could follow; and acting on the thought Toots scrambled to the top of the slimy wall. "Give us your hand," he said, extending his own.

Crumb's right arm hung powerless, crippled by the bullet. He put his left hand into Toots' and with a groaning grunt succeeded in reaching the level. But when he had done this he said: "You leave me yere, boy. You ain't in this an' I deserve all that's comin' to me."

Toots refused to consider this. In a fever of impatience, for the motor-boat was drawing near, he caught the man's left arm and urged him to fly. Crumb yielded and they started through the sedge.

No sounds of a pursuit across the marsh reached them. The men in the motor-boat were evidently too cautious to expose themselves to an ambush in the long grass by armed and presumably desperate poachers. When Toots and Crumb reached the opposite side Toots roughly bound up his companion's arm. Fortunately it was low tide, or they would have been marooned where they stood until morning. As it was, little more than four feet of water was running in the deeper channels while much of the distance between them and Mink Island was dry flat. Though the night was very dark the wind and that sense of direction inherent in most men who follow the water gave Crumb his course. The shock of the wound seemed to have brought him out of the trance-like state he had been in for several days, and he blamed himself bitterly for what he had done. Once he started to quote from the Bible, but broke off abruptly.

"I ain't no call to take the words of that good book in my mouth," he exclaimed. "A low-down sinner like me. No matter how black things look, Toots, don't you ever go back on His teachin's. There ain't nothin' in this world, nothin' whatever, that a man can't bear like er man, 'cept a guilty conscience."

"I'm sorry I made that racket," said Toots. "It was low-down mean."

"It was right," retorted Crumb. "I'm glad you did it."

An hour and a half later, utterly done up and chilled to the bone, they crawled up the slippery apron of mud that fringed Mink Island. Crumb was barely able to reach the steps of the shack where he sank in a fainting condition. Toots staggered into the revivifying warmth of the watch-house kitchen.

"They shot your brother—through the arm," he said to Eden with chattering teeth. "Bartlett ran. You're pirates, the whole lot of you."

Eden bounced out of his bunk, white and trembling, and began to dress, assailing Toots with incoherent questions. But the latter picked up the smoking coffee-pot from the stove and a cup and ran out.

A stiff drink of the strong, hot stuff revived Mark. He entered the shack and confronted his brother with an air very different from the strange one he had worn lately. Eden, half-dressed, sank back on his bunk apprehensively.

"Do you know what I think of you," said Toots to Eden. "You're a slacker. Playing off you had the rheumatics so you could get your brother into this and keep safe yourself. He'd never have gone

A Thinking Job

By Fisher Ames

Copyright, 1929, by Capper-Harman-Stocum Company

into it if you and Bartlett and Sheppardson hadn't made him. I heard you-all working at him."

"I'm mighty upset you got hit, Mark," stammered Eden, moistening his lips. "Is it bad, ole man?"

Mark paid no attention to the question. "I ain't goin' to reproach you, Eden," he said solemnly. "You worked on me, but I give in, so I'm as bad as you. But you'll listen to me now, Eden. There'll be no more of this business. We'll go straight, so help me, if we lose our last cent doin' it. I'll never tech another shell that ain't mine if I know it, nor you won't neither, or we'll part comp'ny for good an' all. An' we're done with Bartlett. I don't reckon he'll care to show his face again, but anyhow we're through with him. You understand me, Eden?"

Once roused Mark was by far the stronger character morally, as he was physically. His brother cringed under his firm, indignant tone, and signified by shame-faced, indistinctly muttered excuses that he was willing to go straight.

"I'll see you do," said Mark significantly. "Now help me off with these clothes an' wash up this bullet hole. Pears like your rheumatics ain't so troublesome, like Toots says. Maybe things won't be so bad if you do more tongs an' less tonguein'."

After his wound had been dressed and Toots and Eden had gone to bed, in spite of the lateness of the hour, Mark took his Bible to the table and sat down to read. His expression had changed entirely. There was remorse in it, but the old look of doubt and turmoil had given way to one of deep, almost happy humility.

The next morning Eden was the first to rise. His rheumatism seemed miraculously to have vanished. In a very chastened mood he got the break-

fast and prepared the power-boat for a run to town where Mark wished to have his wound properly attended to by a physician.

"You'll be quittin' us, I reckon," observed Mark, as he saw Toots packing his duffle-bag. "I don't blame you."

He paid Toots his wages and they locked up the shack and went down to the boat. Hardly a word was exchanged between them during the run. When they reached Carbury landing Mark held out his left hand and wished Toots good luck. "Jest remember, Mark," he said, "I don't blame you."

He said Toots his wages and they locked up the shack and went down to the boat. Hardly a word was exchanged between them during the run. When they reached Carbury landing Mark held out his left hand and wished Toots good luck. "Jest remember, Mark," he said, "I don't blame you."

Toots, thinking hard, walked along the shore with Hector by his side. The roll of the stone had certainly not been a success this time, but it had eliminated the oyster business from further consideration, which was something. What sort of a job was left in or around Carbury that he could tackle now? Toots raised his eyes and looked at the little town speculatively. He had studied the various hotel circulars received in Colonel Jersey's mail from time to time and realized, if the Colonel did not, the impossibility of any competition with the numerous southern resorts that offered to their patrons a gay life, with golf, tennis, automobile-ing and all the other social sports. On the other hand Carbury did offer a quiet, quaint picturesqueness and most excellent shooting and fishing. It would never be a fashionable resort, such as would attract women and young people, but why shouldn't it appeal to men? It was a man's place.

Daddy Simons was working in his garden when Toots reached the cottage. "Well, well, if the rollin' stone himself ain't returned!" he exclaimed. "Never mind my little joke," he added, perceiving Toots' expression. "I'm right glad to see you with that there duffle-bag. I hope it means you've quit the fleet, son."

Nancy, hearing her father's greeting, ran out, overjoyed to welcome Toots back again. They sat down on the steps while he told his story and later, the dinner hour intervening, continued the talk at the table. Daddy had his own news to impart, the principal item of which was the disappearance of Captain Tigert.

"What you told the crowd that day you left brought about a raid on the store," said Daddy. "Tigert saw it comin' an' knew he couldn't face it, but he got round to Jepson, that he leased the store from, an' sold him the stock before the old man knew there was trouble afoot. Then he skeddaddled an' they ain't found har nor hide of him since. They won't neither. I reckon he's hid himself out West somewheres. They found whiskey all right, though, in those sealed bags of Red Mill. Now they're huntin' down that concern. Jepson's been runnin' the store hand-to-mouth. Why don't you step in, Toots, an' get the job?"

"I DON'T want to keep store—for somebody else," replied Toots decidedly. "Look here, Daddy. What do you say to starting a sportsman's hotel, in a small way. You know how the Colonel trained me. I've got two hundred and fifty dollars—and myself—to put in. I've got some ideas, too. You've got just the place for it, a couple of boats, and a big lot of live decoys. And you like gunning as much as your father ever did. I've been thinking about those names in the kitchen. If your father could get men to come from New York and those far-off towns, why, we could."

"The Colonel didn't advertise in the right way. We can. This place is a man's place, and I reckon there's enough men who can afford to pay for good shooting and fishing to fill a hundred hotels. We-all may be short on style, but we're long on sport. We've got the best there is, and no competition."

There wasn't a lazy bone in Daddy Simons' sinewy frame, but he had jogged along in a rut for so many years that any initiative and enterprise he might once have possessed had more or less evaporated. But he could dream still, and one of his dreams was to have enough money to leave Nancy comfortably fixed. In spite of the discrepancy of years between them he had a good deal of respect for Toots' judgment. There was a quiet force and decisiveness about Toots that had always made Daddy believe he would go far. As he had often said to Nancy: "A fellow that's eternally thinkin' of gettin' ahead won't come in last in the race."

A little dazed by the unexpectedness of the proposition, he turned hesitatingly toward his daughter.

"What'd you say to this fool plan?" he asked, smiling.

"I say we'd be fools not to consider it," retorted Nancy.

"I'd hate to have my own child put me in that class," said Daddy. "It looks like we-all better talk it over."

(To be continued.)

A Peppy Patrick's Party

By GERTRUDE S. STEWART

PATRICK'S DAY has become one of the most jovial of the entire year. If you want to give a jolly party, start it off with gay decorations. Make or buy bright green shamrocks and write your invitations with white ink.

When St. Pat's Day is here
That's a time of shure good cheer!
So at eight to dance—to frolic so hearty,
To sing—old dances—to frolic so hearty.
Nora & Mike Murphy.

Decorations are not difficult for this gala occasion. The Kelly Green crepe paper is so bright and cheery that streamers and shamrocks may be used abundantly wherever possible—on curtains, doorways, dolling up the tablecloth, etc. Green balloons give the home or church, the hall or clubhouse a buoyant spirit, so have them tied up here and there.

Keep the piano or phonograph busy as guests are arriving. Put every one in frisky mood by playing the old Irish airs, such as The Machree, Where the River Runneth Floweth, Put the Pig in the Pot, and Kathleen Mavourneen.

Home Games for Old and Young

Blowing bubbles.—This is a good evening frolic. Give each guest a pipe and group them about nice bowls of soap suds where competition may be keen as to who can blow the biggest bubble, the highest one, and the longest-lasting one.

Games may be given in each race, and know of nothing nicer nor merrier than to use little high hats so real of the day, for prizes in all games. Fix them with ties or elastic to fasten on under the chin. Winners wear them all evening.

Potato race.—A quiet sitting game good for next so give each man a fat spud and a dull silver knife.

Ladies act as judges and "rooters" in this speed contest. The idea is to peel who can be first to finish his potato and keep it all in one piece. Thick peeling should be encouraged.

Spring styles.—Now is a good time to have another quiet stunt, so pass green lollypops to each man, or perhaps to each couple. On a nearby table have ready plenty of green crepe paper, scissors, needles, thread, paste, wire and pins. See who can dress the best shepherd, policeman, sailor, or Irish character.

Barney.—Select one guest as first to sit out in the center of the room. Each guest in turn says "Barney" about this central figure paying nice compliments, made as mirth-provoking as possible. The complimented one keeps calm and grave. If he smiles creeps over the face, the chair goes to the one who caused the pucker, and so the game continues until all have been "barneyed."

Guess what.—On the back of each guest pin a card with a symbolic of something Irish. Let no one know what his tag reads. Some words that may be used are: shamrock, lilies, snakes, shamrocks, lakes, rabbit's foot, potatoes, jokes, horseshoes, carriers, horse shoe and so on and on. You can't think of enough to go round, it is better to have two or even more out together. The wearer of each tag tries to guess what his tag means by the antics or questions or suggestions of the others. Whoever leads to the real "give-way" is the winner in the guessing, until all have learned their tags.

What Shall We Eat?

Sandwiches, salad, potato chips and shamrocks make a colorful and pleasing lunch for any and all. Coffee for adults and lemonade for children make the drinks. For favors, make dear little pigs of sweet pickles with pieces of tooth picks for ears and parsley stems for tails.

Make the sandwiches of chopped olives and nuts. For tasty effect serve an open sandwich of

The Farm Home

A New-Old Industry for Health Seekers

By HEPSY NEFF

PERHAPS consideration of health has brought the use of goat's milk more and more to the front in recent years. Today the medical profession agree that the goat and its products are more free from disease than any other of our domestic animals. Besides, goat's milk is a dependable corrective of the acidity which lies back of our rheumatic and many other pains.

That California has led in the dairy goat industry is what might be expected of a population bidding for the favor of health seekers. That Switzerland is the home of some of the best milk goats as well as the home of a progressive people who hold an unquestioned place in history both present and past, is another fact to be considered when we are seeking a basis in estimating values.

Another interesting fact that must be considered is that the oldest people of the eastern world were and are still using the goat as the chief source of their supply of animal foods. The oldest books of the Bible bear witness to the value of the goat in Hebrew history. Perhaps that fact, coupled with the tent life of ancient races explains the record of long life among these people. When Moses at the age of one hundred and twenty years, climbed to the heights of Pisgah never to return, "His eye was not dim nor his natural strength abated."

Today users of goat's milk are repeating some of those old experiences in gains of health that seem marvelous. Another interesting fact revealed in the study of this new-old industry is the number of women who are finding new health along with both profitable and interesting occupation in keeping a few goats. Perhaps this work may yet take the edge off some of our big agricultural problems of today. Even farm folks are inclined to compare the demand for big and increasing incomes with the old days of smaller farm incomes plus the satisfying sense of security in home, job and plenty of good food; a compensation which holds good today.

Some of us have learned that a bank account and a competence for old age grows more surely from a decrease in outgo than from an increase in income. But back of that condition must lie a challenging independence of thinking and habit which is not acquired in a day. Accustomed as farm folks are to the dependable resources of nature we are in danger of forgetting that man-made values are on a different level, not always dependable and sometimes distinctly disappointing. Only as we learn to keep a challenging "Why?" ready for every new demand upon our time or our purse can we really hope to be masters of our circumstances or in any sense masters of life. There is help in remembering that the outstanding quality of all the monkey tribes is imitation; copying everything they see.

Some good day we shall see where mere copying leads us, whether in fashions or in any phase of conduct and we shall determine to be less monkeyish and more intelligent and independent human persons.

School Lunches

ARE school lunches bothering you? Circular 125, on "The School Lunch" is new, and free from Pennsylvania State College, State College, Pa. Farmers' Bulletin No. 712, "School Lunches," may be had by addressing a card to United States Department of Agriculture, Washington, D. C. Both of these bulletins are useful for hot or cold lunches. Fine P. T. A. projects, too.

Noon is the time recommended for the small child's largest meal.

After laundering corduroy or velveteen squeeze it dry with the hands, for the wringer makes permanent creases.

crisp crackers spread with butter and minced parsley.

Pineapple salad is good and pretty. A crisp lettuce leaf, a slice of pineapple filled with a mound of cream cheese topped off with an Irish flag of green watercress, celery leaf, or again parsley. Salad dressing with this salad.

The shamrocks are simply your very best round cookie decorated in keeping with the day. First ice them with white icing—whatever kind you prefer. Have ready material to fashion shamrocks while the icing is soft. Gum drops are ideal for this trimming. The green ones cut in thin slices make nice round sections for the three shamrock parts. For the stem cut them lengthwise, and curve them slightly when you place them.

During the feasting, tell good old-time Irish jokes. If you fear folks will not warm up to this, have a good one written on paper for each plate. This reading will start things off briskly and soon many others will be recalled by your guests. You will probably need to stop those ever anxious to say: "Oh, that makes me think of a good one, too."

Every Day Foods

FOODS needed each day are: an egg, a quart of milk for children and a pint for adults, fresh fruit including citrus fruits or tomatoes and be-

Table decorations will help make your St. Patrick's Day party go with a swing.

sides potatoes, two servings of vegetables, one of which should be a green leafy vegetable.

Correctly planned meals promote long life and sustained health, according to the New York state college of home economics at Cornell University. Even plenty of appetizing food may not supply certain essential materials which must be included each day if health is to be maintained. Health cannot be built overnight; it is the reward of right food and correct health habits practiced daily.

Over-cooking of vegetables is a common cause of the prejudice against them.

If the lock sticks, try oiling the key and turning it several times in the lock.

The child's confidence in himself depends on the confidence his elders put in him.

Save fuel, time and strength by cooking as many foods as possible while the oven is heated.

Occupation for Little Ones

CUT pictures out of old magazines and catalogues. Paste them on mustard jars, jelly glasses, etc. After the paste is dry, cover with a coat of shellac. These make clever vases. My daughter covered tin cans in which I planted flowers. She made flour paste, using a spoonful of flour to two and a half spoonfuls of water, and a tiny bit of sugar to prevent the flour forming lumps. The shellac was purchased at a hardware store, which was the only expense for my pretty flower pots.

My fourteen-year-old son painted the living-room floor while out of school during the Teachers' Institute, and while it isn't as good a job as an experienced painter would have made, it looks much better than it did, and gave him some valuable experience and much pleasure.

"If this paint does not wear as long, look as well, and go as far as the highest-priced paint made we will furnish new paint **FREE** and pay for putting it on". . . .

MONTGOMERY WARD & CO.

THIS guarantee, covering Ward's ZINC-ITE and Master Painter's paint, is the simplest and strongest guarantee in the industry! And the reason we can make it lies in the quality of the paints themselves.

Using only the finest materials . . . supplied by producers like National Lead, New Jersey Zinc, Eagle Picher, and Du Pont . . . we manufacture more than 80 per cent of these paints in our own factory. We consume each year around a half million bushels of flaxseed, and sell millions of gallons of paint annually; while our formulas call for a larger percentage of pure linseed oil and stronger color pigments, to insure finest results for the user. Every hatch of every brand is tested eight different ways . . . and both ZINC-ITE and Master Painter's give splendid hiding power, surface coverage and lasting sunproofness. Your Ward Store also carries a complete line of other house and barn paints, enamels and varnishes for every purpose.

Our nationally famous WARD-SET Brushes, made of pure Chinese hog bristles that absolutely will not loosen or shed, are the ideal companions to these quality paints. Every brush will pass the weight-test illustrated, and we supply a complete line for all painting, varnishing and enameling purposes. WARD-SET Brushes are lower priced than usual . . . and their performance always dependable.

Any of our 550 Montgomery Ward Stores throughout the nation is ready now to supply your painting requirements—not only satisfactorily, but at a real saving.

WARD-SET Brush,
"Painter's Favorite."
Tested under 200-pound pull, and in gasoline, oil, water, alcohol and acids—WARD-SET Brushes never shed a single bristle from their Bakelite setting! This 4-inch brush has finely-balanced handle; gives smooth flow on any surface.
Price, prepaid, \$1.50.

ZINC-ITE is the industry's very latest paint development! Exceptionally sunproof. Covers 40 square feet per gallon (2 coats) at a saving of \$1 to \$2 per gallon. Unusual hiding power and leaves no brush marks. Supplied in 12 colors. Price, prepaid, in 5-gallon cans . . . **\$2.80** per gal.

Ward Paints for the group of buildings illustrated above would save you approximately \$30.

MASTER PAINTERS. The purest lead-zinc-and-oil paint that can be made. Meets maximum U.S. Government Specifications 10B. Formula on every can shows extra percentage of pure linseed oil. Covers 360 square feet per gallon; smooth-flowing. Choice of 12 colors. Prepaid price, in 5-gallon cans . . . **\$3.39** per gal.

We also carry a complete line of barn paints at prices as low as from \$1.20 to \$1.80 per gallon, in 5-gallon cans.

*Price slightly higher in some states.

U. S. Tires are especially suited for service on the farm

Your U. S. tire dealer is a responsible merchant, a tire specialist, and your neighbor.

He not only handles the greatest line of tires in the world for all-round use on farm vehicles, but he is always on the job to take care of your requirements at a minute's notice.

He has the U. S. Royal, built of the finest, purest, toughest rubber and cord the world affords. We know because we grow the rubber on our own plantations; we make the cord in our own mills.

There's no other tire, at or near the price, that will stand up under all kinds of fast, hard, continuous farm operation as well as the new U. S. Royal. It was virtually made to order for all-round farm purposes.

He will show you the U. S. Peerless, an entirely new tire. It is built of the same high quality cord and rubber as the U. S. Royal, but it is priced lower to meet the farmer's demand for a first-class high-grade tire at a very low cost.

He will show you the out-

standing heavy service tire of all time—the U. S. Royal Heavy Service—in balloon or high-pressure.

To choose among these three great tires you have only to consider how much or how little you want to pay for a tire—and what you expect that tire to do.

Your U. S. dealer will not only tell you honestly which U. S. tire is best suited to your needs, but he will put on the tire for you, see that the inner tube is properly fitted, check your air valves, check your wheels for alignment and see that your tire has the proper amount of air in it.

And when, any time after, you want service of any kind, that same U. S. dealer is around the corner or down the road to give it to you. No need to conduct a correspondence with HIM. Your telephone takes the place of your fountain pen!

And more important still, every U. S. dealer stands back of the tire he sells you—and back of him stands the United States Rubber Company, the world's largest producer of rubber. This great organization, with a worldwide reputation for square dealing, is just as anxious as your dealer to see that you are perfectly satisfied with any product that bears its name—a name that extends back to the very beginning of the rubber industry.

Call on the U. S. dealer. You will be surprised to know how much U. S. mileage you can get for so little U. S. money!

United States Rubber Company World's Largest Producer of Rubber

The McCORMICK-DEERING Tractor Line Gives You POWER for EVERY Need

This is the powerful 15-30 McCormick-Deering. It pulls four plow bottoms in all average conditions.

YEAR after year the man who centers his farm operations around the McCormick-Deering tractors gets the utmost out of modern power farming. The reasons are plain. McCormick-Deering tractors are simple, sturdy, highly perfected, standardized models, built with every conceivable advantage and feature, designed by International Harvester skill to work with the full line of McCormick-Deering power farming equipment.

The 15-30

For big-capacity operations on the medium-size and larger farms, take the powerful 15-30. In the field shown above it is turning beautiful furrows at a rapid rate. The powerful 15-30 puts a big day's work in one man's control the year through. Cash in on its generous power and economy during tillage and seed-bed preparation, grain and corn harvest, and the heavier belt and power take-off jobs. Note the list of 15-30 features at the right.

The 10-20 and the Farmall

For smaller operations the McCormick-Deering line offers the 10-20 (built just like the 15-30), and the Farmall. The popular Farmall, shown here with a 4-row cultivator in a corn field, is a true all-purpose tractor in that it also handles the planting and cultivating of row crops. On the majority of farms the Farmall completely solves the power problem, whatever the crop or operation. On the larger row-crop farms it frequently supplements the power of the 15-30 McCormick-Deering.

McCormick-Deering tractors have stood every test in years of service. Nothing has equaled their work in cutting the costs of production. Make full use of McCormick-Deering power during 1930. Displayed and serviced everywhere by the McCormick-Deering dealers.

McCORMICK-DEERING

"Assurance Doubly Sure"

FRANK K. RICH

"WHEN a man goes to work to make a sure thing even more certain," observed Mr. Peaslee when Deacon Hyne had been recounting to him an experience which savored more or less of that motive, "more times than even he'll find he'd have done better to let things take their own way and welcome his luck the way it comes."

"Mebbe you're right," the deacon conceded, but doubtfully. "Whenever I hear of a case such as you've just been tellin' me about," Caleb went on, "I'm put in mind of Jim Pallbush, the time he thought he'd get the best of things. He'd always been more or less given to makin' things too safe; but he got cured of it by a set of happenin's that took place all in one day, so that from then on Jim was more like other folks, and let things happen or not happen, the same as ordinary men have to."

"Jim was a good neighbor," Mr. Peaslee admitted, "and his proneness to make safeness safer wa'n't really an out. I don't s'pose; it only made him hard to work with."

"I reasoned with him about it once, when I was helpin' him shingle his barn and noticed him drivin' three nails into every shingle, no matter how narrow it was. He told me he done it to be sure the shingle would stay there."

On the Side of Safety

"Well," s'I, "two nails'll hold it there 'til it rots—and three won't do any more'n that. That third nail looks like waste to me," I says. But I couldn't move him in his b'lief!

"And he was like that in all his doin's—do all any prudent man'd do and then a little more on the side of safety. It held him back in his work and held him back in his profits, too. But he claimed no man was ever the loser for a little extra care and said when he'd lost by it would be time 'nough to change his ways—so I give up arguin' with him!"

"Well, there come a day when I was over with him to help him ferry some stuff across the pond—lamps and dishes and one thing and another that old lady Burpee gave Jim's wife. We had a canoe and we loaded the truck careful and made a good crossin', by holdin' steady and hardly shiftin' a laig on the trip. When we landed back on the near side of the pond we found we'd got too much of a load for two men to lug, so Jim d'cided to go up and git a hoss and his porter wagon, with a thick layer of hay in the bottom to take the jar and save the lamps and things from gittin' broke. But fust we had to unload the canoe and git it out of the water."

Expects a Shower

"I helped him haul it up on the shore and s'posed that was all needful to be done—but it wa'n't, not 'cordin' to Jim's notion. He give a look at the sky and seemed to find some sign of rain there, though I couldn't see anythin' near 'nough to hurt. But he figured, to be on the safe side, he'd better drag the canoe up next to the fence and turn it over, in case the storm was hard 'nough to make waves; and then it come to him that it'd be better to turn the canoe over the lamps and things, to keep 'em dry, in case."

"He picked out a place where the fence wa'n't over a foot 'n' a half high, 'count of there bein' a little grass there to pile the things on. I noticed a pair of young cattle in the pasture but I didn't mention it, thinkin' that it didn't become me to p'int out dangers to any man as careful as Jim was. Still, I couldn't help givin' a thought to what might happen if them cattle got to nosin' 'round that low place in the fence, after all the pains Jim had gone to, p'ilin' the

things up there to make 'em more safe, you know."

"Well, after we'd got 'em stevedored to his likin' we put off up to his house, to git the hoss and wagon. By that time the shower, such as it was, had dissolved, 's you might say, so all the extra pains Jim had gone to was wasted. I didn't mention it, partly because I knew he'd thought of it, by the way he looked."

"It took us some time to go to the house and back and whilst we were there I heard some noise—cattle bellerin' and dogs barkin' down in the pasture. I wondered a mite what it might be, but Jim didn't say anything, so I held my peace. We had to drive 'round by the road to git back to the canoe and long b'fore we got to it—about as soon as we sighted it, 's a matter of fact, I sensed that something untoward had took place; and so did Jim. And when we got closer we c'd tell jest what had happened about as well 's if we'd been there to see it all."

A Dear Lesson

"Fust of all, we c'd see the canoe had been moved—it was a matter of five foot away fr'm the fence now—and when we got there we saw a couple of holes right through the side; about such a hole as a steer's foot would make if he stepped on it. And the lamps! And the dishes! There was one lamp shade whole—but that was the whole tally. Every other dish and lamp was hurt—some of 'em shattered and some of 'em only cracked, but every nameable one of 'em sp'iled outright, fur's looks went!"

"By the tracks in the mud we c'd piece together what had took place—there was the tracks of them young cattle and behind 'em and over-lappin' 'em in spots, was the tracks of the three dogs that had got to chasin' 'em—jest in sport, you know, to see the steers run, a good deal as any young critters'll git to playin' sometimes, jest like kittens. But in this case their playin' had done some damage."

"Well, I started to say something about bein' over-careful, but a look at Jim's face made me hold my speech. He looked at me and then at the wreck on the ground and then back to me again."

"A canoe sp'iled," he says, "that's wuth thirty dollars; and lamps and dishes ruined that like 'nough my wife'll value higher'n the canoe! And all for what? To guard against a shower that never come—and to make safety sure by p'ilin' everything in the path of d'struction! If this ain't a lesson to me, Peaslee," he says, "I'll never have one, not to be over-cautious again. Hereafter," he says, "Jim Pallbush is goin' to be a man to take ord'nary chances, same's other folks take. It may be a wrench to my habits," he says, "but I'll save time by it, anyway—and mebbe money, in the long run."

"So you see now, Hyne?" Mr. Peaslee said.

And the deacon, no longer dubious, said, "I see."

A New Book

"VEGETABLE GROWING," by James E. Knott, is a new book on the production of garden and truck crops. Its aim is "to set forth the fundamentals of vegetable production, suggesting wherever possible the reasons for the methods followed and the plant responses obtained." The book is well bound, illustrated, contains 352 pages and should prove a valuable addition to the vegetable grower's library. It may be obtained for \$3.25 from the publishers, Lea & Febiger, Washington Square, Philadelphia, Pa.

Mail The Coupon Below

For Valuable FREE Books

Just your name and address on the coupon below will bring you two valuable books free. One book is "The Soil and Its Tillage," the other is the CLARK "CUTAWAY" Catalog of Disk Harrows and Farm Implements.

"The Soil and Its Tillage" is a small encyclopedia of farm information. Simply written, it tells in detail:

What the Soil Consists of, Kind of Soil, How Plants Feed, What Tillage Accomplishes, How Deep Tillage Increases Crops, Modern Method of Tillage, Disking without Plowing, Orchard Tillage, Types of Disk Harrows, etc.

The book, which is fully illustrated, shows how to get bigger, better crops, how to save time and labor—how to make your farm yield greater profits.

The CLARK "CUTAWAY" Catalog illustrates and describes the full line of CLARK "CUTAWAY" Disk Harrows—from the Baby Cultivator and one-horse, Single-Action harrow to the Double-Action harrows for Fordson and other tractors. It also tells about special machines such as Bush and Bog Plows, Smoothing Harrows and others.

It tells why the Disks on all CLARK "Cutaway" Harrows are made of cutlery steel heat treated and forged sharp instead of rolled; it explains many features found only on CLARK "CUTAWAY" Implements that mean better tillage with less time and work.

Whether you have a small truck farm or one of hundreds of acres, whether you are ready to buy now or later, send for these two books.

There is something of interest in each for you. No obligation at all. Mail the coupon now.

"Since 1865"

Clark
"CUTAWAY"

CLARK "CUTAWAY" Utility Harrow
A general favorite one-horse harrow. Has 10 14-inch disks of cutlery steel heat treated and forged sharp. 5 inches apart and cutting 4 feet wide. Steel frame. Lever for shifting gangs. Disks equipped with clodbreakers.

CLARK "CUTAWAY" Single Action Harrow
For deep thorough tillage. Made with reversible gangs. Extension heads for orchard cultivation. Light draft, no tongue truck required.

Flexible Double Action Harrow
Those who prefer a flexible Double Action Harrow can now get it in a genuine Clark "Cutaway". The rear gangs do their full share of the work. Turns the shortest corners easily. Screw control. All steel construction. Tractor model only.

CLARK "CUTAWAY" Unit Frame Double Action Harrow
Cuts your land deep, thoroughly pulverizes the soil, leaves a level, even seed bed. Rear disks cut exactly halfway between front disks and at same depth. Several sizes, horse and tractor model. (Tractor model, all steel construction.)

Clark "Cutaway" tillage tools distributed by Downey Implement & Supply Co., Phila., Pa. and I. W. Scott Co., Pittsburgh, Pa.

WINNETUXET DEBUTANTE, 165454; Owner, D. W. Gurnett, Kingston, Mass.

Quaker DAIRY RATIONS

the feeds that produce champions

WINNETUXET DEBUTANTE is one more outstanding example of the great value of Quaker Dairy Rations in maintaining record milk production. This Guernsey has just completed her second Advanced Register Test, with 17,479 pounds of milk and 848.6 pounds of butterfat to her credit. This established her as first in Class BB in amount of milk produced and fourth of the seventy leading cows in all the Double Letter Classes.

Her owner, Mr. Daniel W. Gurnett of "Clearing Farm," Kingston, Mass., writes: "The only grain ration she (Winnetuxet Debutante) received during her test was Quaker 24% Protein Dairy Ration, fed with beet pulp and alfalfa hay. She was never off-feed at any time during the test, and gained more than 75 pounds in weight. She has also given us a fine, healthy bull calf weighing 95 pounds.

"Our young stock and dry cows are fed Quaker Sugared Schumacher Feed, and the whole herd is kept in excellent condition for record milk production with your Quaker Feeds."

Dairy herdsmen everywhere share Mr. Gurnett's admiration for Quaker Dairy Rations. They have demonstrated to their satisfaction that Quaker means maximum milk production and maximum profits at a minimum investment. If you have not seen for yourself the value of feeding Quaker Dairy Rations, consult your Quaker dealer at once.

THE QUAKER OATS COMPANY, CHICAGO, U. S. A.

Quaker Sugared Schumacher—is the complete carbohydrate feed; combines perfectly with any Quaker high protein concentrate (24%, 20% or 16%). A choice feed for all young and dry stock; an entire grain ration for horses, steers, lambs and swine

The Education of the Cow

(Continued from page 8.)

ignorant and their production was correspondingly low, the average yield for Pennsylvania cows in 1880 being 2,004 pounds of milk. In 1925 with a better knowledge of diet, efficiency, eugenics, health, sanitation, etc., the average yield had increased to 4,500 pounds of milk per cow.

There has been still greater increase in the production of cows that are members of those efficient educational agencies known as cow-testing associations or dairy improvement associations. In 1910-11 there was but one cow-testing association in the state and the average production of the 516 cows in it was 5,724 pounds of milk and 234.5 pounds of butterfat. In 1928 there were 76 associations including over 28,000 cows and the average production was 7,776 pounds of milk and 303.7 pounds of butterfat, an increase of over 2,000 pounds of milk per cow and 69 pounds of butterfat.

Results Apparent

The College herd is kept primarily for the instruction of students in dairy cattle judging, feeding, management and for the conduct of dairy cattle feeding experiments. Naturally under these conditions the yield is considerably lower than would be the case if milk and butterfat production were the chief purposes. However, the results of the education of these cows are also quite noticeable. Averaging the yields of all cows of all breeds in the herd, including those on experiment, some of which were put dry a considerable portion of the year, the yields by five-year periods were as follows:

| Year | Av. No. Cows in Herd | Av. Yield Milk (lbs.) | Av. Yield Fat (lbs.) |
|----------|----------------------|-----------------------|----------------------|
| 1891-95 | 29.65 | 4720.4 | 225.70 |
| 1896-00 | 28.17 | 5004.8 | 243.45 |
| 1901-05 | 30.91 | 5284.9 | 266.96 |
| 1906-10 | 38.46 | 5372.3 | 264.56 |
| 1911-15 | 47.40 | 5773.9 | 278.33 |
| 1916-20 | 30.80 | 7175.1 | 340.61 |
| 1921-25 | 61.38 | 8293.1 | 331.91 |
| 1926-28 | 67.58 | 8502.9 | 347.05 |
| Increase | 37.93 | 3782.5 | 121.35 |

The table shows a consistent increase from year to year with a gain of 121 pounds butterfat for the last period compared with the first.

A Farmer's Figures

What an "honest to goodness" dairy farmer can do in educating his cows to produce milk and butterfat more efficiently may be seen from the following record of a herd in Bradford county which was in a cow-testing association for five years:

| Year | Lbs. Milk | Lbs. Fat | Returns Above Feed Cost |
|--------|-----------|----------|-------------------------|
| First | 7150 | 274 | \$45.90 |
| Second | 7067 | 273 | \$41.80 |
| Third | 8221 | 305 | \$61.57 |
| Fourth | 9109 | 346 | \$120.16 |
| Fifth | 11720 | 454.5 | \$193.49 |

This man started with ten head of grades. He gradually weeded out the low producers that were detected by the records of production kept by the cow-testing association. He kept a pure-bred sire and raised the heifer calves from his best cows. Furthermore he got a start in pure-breeds and gradually worked more and more into a pure-bred herd until at the end of the fourth year he sold his grades and kept a pure-bred herd of eight cows the fifth year. It is interesting to note that the milk yield increased 4,507 pounds per cow and that the returns above feed cost per cow jumped from \$46.50 to \$222.53.

Scores of other Pennsylvania dairymen could be mentioned who have educated their cows to give from 2,000 to 4,000 pounds more milk yearly and from 75 to 150 pounds more butterfat after two to five years' work in the cow-testing association.

We send our boys and girls to the public school, to high school and to college to make them more efficient

The national champion senior three-year-old Jersey for both milk and butterfat production is Ida Clifton's Ethel, shown above. She produced 1,030.79 lbs. of butterfat and 18,151 lbs. of milk in a year for her owner W. D. Howard of Massachusetts.

and to enable them to make a better living and to render greater service to their fellowmen. Similarly the education of the cow in matters of diet, economy of production, eugenics, health and sanitation, should enable her to be a more efficient milk producer, to make a better living for her owner and to render a greater service to humanity by producing dairy products of the highest possible quality.

C. T. A. Reports

Northern York County
THE Northern York County Cow-Testing Association finished its third year January 1, 1930, with 18 whole-year and two part-year members with ten bi-monthly members in the Association which are included in this report.

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1927 | 216.57 | 7493 | 310.3 |
| 1928 | 303.66 | 7453 | 317.3 |
| 1929 | 312.36 | 7696 | 318.2 |

Eleven herds with an average of five or more cows exceeded an average production of 300 lbs. of butterfat. A complete list of these herds is as follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|----------------------|---------------|-----------|----------|
| N. E. Rishel | R.H. | 12106 | 413.7 |
| Geo. B. Livingston | R.&G.H. | 11141 | 409.3 |
| J. A. Poorbaugh | R.&G.G. | 8218 | 373.5 |
| Wm. F. Dummer | G.H.&G.G. | 9714 | 390.6 |
| J. J. Hamme | R.G. | 7154 | 346.2 |
| J. Raymond Arnold | R.&G.G. | 7238 | 311.4 |
| Frank L. Krall | R.H. | 9576 | 334.9 |
| W. W. Little | R.G. | 7430 | 331.2 |
| C. Allen May | R.G. | 7035 | 327.6 |
| O. C. Livingston | R.&G.H. | 9198 | 319.9 |
| Haines Acres | R.H. | 8388 | 302.0 |
| Wm. F. Schaefer, Jr. | Geo. G. Weber | | |

Susquehanna County
THE Western Susquehanna County Cow-Testing Association, Route No. 2, finished its second year, February 1, 1930, with 17 whole-year and eight part-year members. There were 544 cows in the Association during all or part of the year. The result for the two years is as follows:

| Year | Av. No. Cows | Lbs. Milk | Lbs. Fat |
|------|--------------|-----------|----------|
| 1928 | 325.74 | 8549 | 303.5 |
| 1929 | 348.69 | 9932 | 351.5 |

Fifteen herds with an average of five or more cows exceeded an average production of three hundred pounds of butterfat. A complete list of these herds follows:

| Owner | Breed | Lbs. Milk | Lbs. Fat |
|-----------------------|---------------|-----------|----------|
| Geo. E. Page | R.&G.H. | 12746 | 438.2 |
| O. H. Green | R.&G.H. | 12951 | 422.5 |
| F. R. Cope, Jr. | R.&G.H. | 12101 | 418.7 |
| Wells C. Phelps | R.&G.H. | 11703 | 389.3 |
| Ray Walworth | R.&G.H. | 11014 | 372.7 |
| R. D. Rice | R.&G.H. | 9576 | 355.4 |
| Harold McKeeby | R.&G.H. | 8853 | 311.4 |
| Joseph Sutton | R.&G.H. | 9805 | 339.4 |
| James Ball | R.H. | 9985 | 327.7 |
| Theron Cooley | R.&G.H. | 9766 | 327.2 |

The Story of Woodbine Farm

By W. D. ZINN
CHAPTER IX

VAGUE indeed were the notions about farming during my father's lifetime. I well remember the first farmers' institute ever held in our county. The late D. D. Johnson, who at that time held some state position but who was a farmer, came to Philippi to hold a farmers' institute. My father was elected president of the meeting. I remember that Mr. Johnson said that somehow or other when clover was grown on the land grain crops were improved. It was not known at that time why clover improved the soil.

Crude as the teaching was, that and subsequent meetings of the kind did much to better the agricultural conditions of the county. About this time the Morrill Land Grant Act was passed by Congress and the money appropriated by this act was given for the establishment of agricultural colleges in the United States. But a number of years passed before the money appropriated to teach agriculture in our own state of West Virginia was used for that purpose.

Board of Agriculture

The State Board of Agriculture was created by an Act of the Legislature passed March 13, 1891. It was composed of one commissioner from each Congressional District. Their terms began on the first day of April, 1891. The first meeting was held in Charleston on the first Monday in May. The members were B. F. Fisher of the first Congressional District; C. R. Shaw of the second Congressional District; John W. Rowan of the third, and T. C. Atkeson of the fourth Congressional District.

Soon after the appointment of the Board of Agriculture it started a publication called the West Virginia Farm Bulletin. It made its appearance April 1, 1892, and was continued under this title until July, 1893, when the name was changed to the West Virginia Farm Reporter. In 1898 the title was again changed to the Farm Review. In October, 1905, the publication of this paper was discontinued.

T. C. Atkeson, of Putnam county, and the late James George, of Mingo county, being members of the Board, were sent out by the Board to organize farmers' meetings or "institutes," as they were afterward called. In many places farmers ridiculed the idea of teaching agriculture, but like faithful missionaries these men continued to talk better farming. In a number of counties considerable interest was aroused. Later as I went over the state I heard farmers speak of Mr. George as "the man who knew all about corn."

Early Institutes

When A. B. White became Governor, in 1901, he appointed the following named persons as members of the State Board of Agriculture: A. B. McCullough of Ohio county, E. J. Humphrey of Wood county, Walter Hollie of Doddridge county, Dr. D. J. Border of Jefferson county, Rossi M. Fisher of Morgan county, Col. J. A. Ewart of Raleigh county, and W. D. Zinn of Barbour county. Mr. Fisher's nomination was not confirmed by the Senate, and M. V. Brown of Putnam county was appointed in his stead.

On account of the lack of funds the former boards had done little toward organizing farmers' institutes in the various counties. At the first meeting of the Board held in Charleston, on the first Monday in June, 1901, A. B. McCullough was elected president and J. O. Thompson, secretary. It was decided to put on an aggressive campaign to hold institutes in every agricultural county of the state. When the Board began to look for institute speakers it found very few in the

BE PROUD OF YOUR BARN!

Whether you build a palatial structure or a modest little general purpose farm barn, you can make it the "show place" of your community if the plans and equipment are right. Louden is always glad to help farmers work out that kind of plans and to furnish the kind of equipment that makes permanent friends of its users.

Build From Good Plans

THE LOUDEN planned and equipped barn actually costs you less, to build and to operate, than the barn you might build without such experienced help. Louden-planned barns are designed for the comfort and health of the animals they house; for the convenience and profit of the men who own them. Such plans cost you little, or nothing, beyond the cost of equipment.

Louden equipment results in greater production and speedier gains—additional income. It gives you the most for every dollar spent—in convenience, sanitation, time and labor saved daily, enlarged earning power.

Whether you plan to build or remodel, or whether you need equipment only, check the items of interest and mail the coupon NOW. Full information will be sent to you at once—without cost or obligation, of course.

What Age Nursery Trees?

By S. W. FLETCHER

H. G. BAUGHER of Adams
county, Pa., and Professor
F. N. Fagan of State Col-
lege staged a friendly argument at
the recent meeting of the State Hor-
ticultural Association on the ques-
tion, "Have we been stressing too
much the superior value of one-year-
old apple trees?"

Mr. Baugher, speaking for the nur-
serymen, made the following points:
A one-year-old tree is so small that
it is more likely to be run down in
cultivation the first season than the
older and larger tree. Some varieties
grow faster in the nursery than others;
under Pennsylvania conditions it is
difficult to secure a growth of five
feet the first year, even for strong
growing varieties like Stayman.

If the small one-year whip is left
in the nursery it will make a five to
seven-foot tree the second season,
with a heavy trunk. Using the modern
power digger, most of the roots of
the two-year-old tree are saved; this
was not true when nursery trees were
dug by hand.

Two-year trees can be certified as
true to name with much more assur-
ance than one-year trees. Root gall
seldom shows on one-year trees even
if present, but is fully in evidence on
two-year trees; this advantage alone
is worth the extra cost of the older
trees.

The Other Side

Professor Fagan, on the other hand,
contended that the superior value of
large one-year trees has not been
over-emphasized; that they have been
made necessary by changing condi-
tions in the fruit industry.

Twenty-five years ago no nursery-
man dug an entire block of one-year
trees; many do so now, because fruit
growers demand them and nursery-
men should strive to please their clients.
Twenty-five years ago orchard-
ists were satisfied to buy large, high-
headed, two-year trees, having a
bunch of branches at the top; now
they are not. The heavy loss from
breakage in the orchard, due to poorly
placed limbs, has made the fruit
grower desire to train the young trees
himself, not leave it to the nursery-
men.

The nursery industry has been very
slow to respond to this new demand.
The fruit grower now requires of the
nurseryman a tree on which he can
form the head himself; usually this
can be done to best advantage on a
one-year tree.

Index to Vitality

Another important point, says Pro-
fessor Fagan, relates to size as an
index of vitality. It has been shown
by experiments that small, weak nur-
sery trees usually become small, un-
profitable trees in the orchard; the
runt nursery tree stays a runt. The
fruit grower will want to know, there-
fore, whether this five-foot two-year
tree that the nurseryman offers him
was a cull at the end of the first sea-
son. If so, he does not want it at any
price. Any tree, however, that is
large enough to plant at the end of
one season assuredly has the vigor
that is essential to future success in
the orchard. It is more difficult to de-
termine this point in a two-year tree.

Much depends, also, on the way the
two-year tree has been handled after
digging and previous to planting. If
it was dug in the fall and stored over
winter in the cellar, with the branches
tied in close, which is the common
practice, the bent branches are likely
to be so injured that they must be
cut back to two to four buds. This
was the standard recommendation
twenty-five years ago. The same con-
dition exists if the trees are dug in
the spring and lie in bundles any
length of time.

This close heading back of the site
branches of two-year-old trees, neces-

sitated by bending, results in a poor
head, since the scaffold limbs branch
too close to the trunk. There is no
such injury with one-year trees, and
the scaffold limbs can be properly
spaced.

Summing up his argument, Pro-
fessor Fagan favors a large one-year
tree primarily because the fruit grow-
er can train it himself, whereas, most
two-year-old trees received from the
nurseries are headed too high and the
branches are bunched. Other things
being equal, he favors the use of
Pennsylvania-grown trees, because
they can be secured in a fresh condi-
tion, and growers can see them at
the nursery; but Pennsylvania nur-
serymen must give the fruit growers
what they want.

If a one-year tree of sufficient size
cannot be produced under our cli-
matic conditions, then the nursery-
man should follow one of two courses;
either head it low at the end of the
first season, not over two feet, so that
the following year it will develop a
leader on which the fruit grower can
debud to form the frame work; or
head it high (or not at all) and debud
these trees in the nursery row.

Either method will win back the
trade that now is passing more and
more to southern nurseries, which can
easily produce the large one-year tree
that growers prefer.

The jury (the readers of Pennsylv-
ania Farmer) will now pass on the
merits of the question, and of the ar-
gument. The kernel of the problem, to
venture a personal opinion, is not age,
nor even branching, but vigor. Since
a five to six-foot one-year tree is
bound to have great inherent vitality,
it is to be preferred to a two-year
tree, in which this is more uncertain.

Cherries Rot

Can you tell me why cherries rot
every year about the time they start
getting ripe? Is there anything to pre-
vent it? M.

PROBABLY this is the brown rot,
a fungous disease which also at-
tacks peaches and plums. This at-
tacks the blossoms and kills the twigs,
making a small canker at their base.
The brownish dust covering the
outside of diseased fruits is made up
of spores which blow to other fruits,
thus spreading the infection.

The diseased fruits shrivel. These
"mummies," whether on the tree or
on the ground, together with the can-
kers, carry the disease over the win-
ter and are the sources of infection
the next season. The mummies
should be destroyed, either by burn-
ing or burying. Early spring plowing
is beneficial in this respect, by bury-
ing the mummies. Satisfactory con-
trol cannot be secured, however, ex-
cept by spraying or dusting.

Spray with self-boiled lime sulphur
at intervals of ten to fourteen days,
from blossoming time until within
two or three weeks of ripening. Sul-
phur dusts also are effective. See
your county agent about the county
spray service. S. W. F.

Rabbit Damage

I have several small apple trees (one
to two inches in diameter) which have
been peeled by rabbits—some little, but
others two-thirds or more around.
Others are peeled clear around the
trunks. How shall I treat the trees, or
would it be best to reset with new
trees? A. R. Heintzman.

PAINT the wounds immediately
with liquid grafting wax. If you
cannot get this melted paraffin will
do. As far as is practicable bank up
soil around the injured portions. If
this is done before the wood dries out
you may save all these young trees,
even those that are completely girdled;
but it might be better to pull out
the most seriously girdled trees and
set new ones. S. W. F.

Truck Crops

By GILBERT S. WATTS

A READER who has had a
great deal of trouble with
clubroot of cabbage owns a
field that has been in sod for five
years and where cabbage never has
been grown. He wonders if he will
have clubroot again if he plants his
cabbage in that field.

He plans to lime the field and that
is right because clubroot flourishes in
an acid soil. The lime should be ap-
plied after plowing and be harrowed
in thoroughly. Cattle have been pas-
tured on this piece of land. If they
have been fed cabbage with diseased
roots attached clubroot is almost cer-
tain to have been spread in the
manure. If that has not been done
and the field does not receive surface
water from higher land it can be ex-
pected to be clean.

Then care must be exercised not
to drag soil from the severely in-
fested fields to the clean fields on
harrow or cultivators. And most im-
portant of all, the plants must be
grown in soil that is known to be
free from this pest. Not having club-
root is mostly a matter of exercising
these precautions and of not growing
cabbage in the same ground more
often than once in four to six years.

For Irrigation

I have a stream of water through
the farm and it never goes dry. It is
about a foot deep. I would like to put
in a sprinkling system with pipe right
from this stream. It has a good fall,
around five feet from the stream to
the level of the land. Would you tell
me if a hydraulic ram would take care
of it? F. H. T.

In reply to your inquiry about op-
erating a sprinkler irrigation sys-
tem directly from your stream of
water, a fall of at least 25 or 30 feet
would be required for fully satisfac-
tory results.

In regard to using a hydraulic ram
this plan may offer possibilities if
you expect to irrigate only a very
small area at a time, but I am in-
clined to believe a pump working di-
rectly into the distributing lines
would prove more satisfactory.

The Bean Beetle

The Mexican beetles have been so
bad here it is almost impossible to
grow any beans. Will you please ad-
vise me what to do for them?
E. E. Perry.

It is altogether possible and prac-
ticable to control the Mexican bean
beetle by either spraying or dusting.
Rather than give the brief instruc-
tions which may be included in a
letter I wish, since many weeks will
pass before planting time, to suggest
that you write the Division of Agri-
cultural Extension, State College, Pa.,
for a copy of Circular 122, entitled
"Vegetable Garden Insects."

Then in addition to having complete
information on the bean beetle you
will have a ready source of informa-
tion on all the common garden in-
sects.

An Acre of Tomatoes

I am contemplating growing an acre
of tomatoes. Will you kindly tell me
where I may procure information on
preparation of the soil, fertilization,
spraying and marketing?
C. A. R.

If you want to know all about
tomato growing send \$1.25 to
Orange Judd Publishing Co., 15 East
Twenty-sixth street, New York City,
and ask them to send you the book,
"Tomato Production," by Paul Wark.
This is a very complete yet concise
little book that no tomato specialist
should be without.

Farmers' Bulletin No. 1338, "To-
matos as a Truck Crop" may be
secured free from the Office of In-
formation, U. S. Department of Agri-
culture, Washington, D. C. Al-
though this bulletin was published in
1923 you will find it full of sound
information. Bonny Best, Greater
Baltimore and Marglobe are hard
varieties to beat.

Hoffman's FARM SEEDS

IN every community there
are a few farmers who
have better than good crops, and in every case
these will be farmers who bought better than
good seed... because no crop can be better
than the seed that goes into it.

Hoffman Seed has not only all the usual features
of good seed... but it has extra values. Extra
fine strains. Extra cleaning. Extra high ger-
mination. Dependability which causes the sons of
old customers to plant Hoffman Seed just as
their fathers did before them.

You may think such EXTRA VALUE seed
costs more—but actually it costs far less—when
you give it credit for the bigger, finer crops it
gives you. Hoffman Seed is always sold as low
as good seed can be sold. Handled in very large
quantities. Sold direct.

Clover: U. S. Verified-Origin with official
—no foul weeds. Germination tested. "EXTRA"
Red Clover. "EXTRA" Mammoth. Northwest,
Grimm and Kansas Alfalfa.

Also Alsike, Timothy, Sweet Clover, etc.

Oats: Nine tested heavy yielders, tree and
side oats. Hardy, Northwest seed.
Cleaned clean. Early and mid-season varieties.
Shadland Climax, Swedish Select, Victory,
White Russian, Patterson and other well-known
kinds.

Corn: A dozen varieties—all favorites. Ear-
ly and late, for husking and for en-
silage. Wonderful producers, grown for seed and
its germination insured by our new Corn Drying
Plant. Lancaster County "Sure Crop," "Long's
Champion Yellow," "White Cap Yellow Dent,"
"Red Cap White Ensilage."

Potatoes: The kind that every success-
ful potato grower insists upon.
Best Northern-grown, disease-free varieties
from Maine and Northern Michigan. Irish Cob-
blers, Green Mountain, State of Maine, Michigan
State Certified Russets. Also Lancaster County
Russets grown from last year's Michigan Cer-
tified.

THE YOUNG PEOPLE

A Jolly St. Patrick's Day Party

SMILES, jokes and the general informality associated with Saint Patrick's Day parties make them the most entertaining events of the season. And decked with the bright and pleasing decorations made especially for this festive day, the party is bound to be a success.

There are a variety of amusing games, too, so altogether it is one of the simplest of parties to plan.

Invitation

A jolly invitation written on a green cardboard shamrock may read:

"Come on the avenin' of Saint Patrick's Day Where all must be jolly and eager to play Come smilin' and beamin'—AND Be prepared to take jokes!"
.....8 p. m.

Decorations

To give the room where the games are to be played a festive air, a center decoration may be made of three large green shamrocks. This may be placed around a light. From the center, extended to the corners of the room, miniature festoons of Nile green and emerald green are draped like garlands. Smaller cardboard shamrocks on strings are placed at irregular intervals on the garlands. See last paragraph for suggested booklets.

Games

Kissing the Blarney Stone

Blindfold each player in turn, and let him walk to a table, which should be five or six good steps away, pick up the first "stone" that he touches, and kiss it. As soon as this is done, the blindfold is removed, and he is allowed to read the "blarney" that is written on the bottom of the "stone." If possible, use real stones, or make them of cotton batting or crushed-up tissue paper covered with gray paper, stretched over the foundation, and pasted neatly. The "blarney" may be on round or oval pieces of writing paper pasted to the "stones."

A Shamrock Hunt

Hide a number of green paper shamrocks in different parts of the room. Have the players form a line and march around in a large circle while, some one plays a lively Irish tune on the piano or phonograph. The music stops suddenly and the contestants are allowed two minutes in which to hunt for shamrocks. The marching and hunting are continued alternately until the shamrocks become scarce. Only one shamrock may be picked in each hunt. Any one failing to find one during any hunting period must leave the circle. The one who remains in the ring for the longest

time is given a prize. This may be a bouquet of Nile green crepe paper carnations. Send ten cents to Party Editor, care of Pennsylvania Farmer, for further instructions about making flowers.

Green Contest

Each person is furnished the following list of questions written on a shamrock cardboard cut-out. All answers must contain the word "green." As the questions are comparatively easy to answer, a time limit should be specified.

A valuable paper Greenback
A merchant Greengrocer
An inexperienced person Greenhorn
A country Greenland
A lawn Greensward
A glass house Greenhouse
A plum Greengage
An apple Greening

The dining room, of course, is one of the chief attractions of the party, and here are some suggestions for making charming table decorations that will help your party to go with a swing.

Paper lace doilies are used on the table with large green cardboard shamrocks. To make the centerpiece, use a small hat box for foundation. Take two folds of crepe paper, one Nile green and the other emerald green, and cut in strips of long pointed petals. Paste a strip of the emerald green petals to the box. This is done by covering the box with paste and then gathering the plain end of the strip around the box by holding the

gathers in place with the thumb and forefingers.

Use shamrock cardboard cut-outs in assorted sizes and attach with gum tape to a heavy wire which has been wound with a narrow strip of emerald green crepe paper. The wires are 18 inches long. Then gather the Nile green petals together like a huge pom-pom, adding shamrocks at regular intervals. Then gather a few rows of emerald green paper petals to form the outside rows of the rosette. Tie together with spool wire like a huge flower, cutting off excess paper below the spool wire. Place in the center of the box. Favors may be placed among the petals or in the bottom of the box.

Place Cards and Nut Cups.—Gather a strip of green paper around an ice cup foundation, pasting along the lower edge of the cup. A place card of a little Irish lad or lassie may be pasted to the front of the cup.

Favors.—St. Patrick's Day dolls may be made by taking a small piece of cotton batting round ball shape for a head and covered with a piece of white crepe paper which has been stretched. Two pieces of heavy wire are wound with crepe paper to form the legs and a shorter piece of heavy wire is wound with emerald green wire for arms. Spool wire is used to join the doll together. They are dress-

Simple decorations of paper are attractive and inexpensive.

ed in emerald green crepe paper and trimmed with gummed shamrock hearts.

Refreshments

The refreshments may be "Irish Toast" sandwiches made in two tiers, like club sandwiches, using three thin slices of toast for each one. Have one layer filled with chicken salad and the other potato salad. Tiny Irish lags from almost any stationery store may be stuck into each one.

The salad may consist of cream pimento cheese, olives and green peppers. The olives are chopped and mixed with the cream cheese, and then stuffed into whole green peppers, and allowed to stand in the ice box for a time to stiffen. The peppers are then sliced across and the shamrock slices arranged on lettuce and sprigs of water cress, and covered with French dressing.

Send for Booklets

"How to Make Crepe Paper Flowers" including directions for making carnations will be sent to you upon receipt of ten cents.

"How to Make Table Decorations and Favors" including instructions for making crepe paper and wire dolls, and the "Gala Book" with additional party suggestions will also be sent for

ten cents each. Enclose money or stamps and address Party Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

HAVE YOU READ ABOUT THEM?

What? Our new contests, of course. Now is the time to get in on the fun readers of the Young People's Page are having. There are always prizes for the best drawings and stories. Below you will find the subjects for both boys and girls.

For the Boys

1. "Why I am Going to Leave the Farm," or
"Why I am Staying with My Dad."

Let's hear both sides of the question from the boys.

For the Girls

2. "What Manners Mean to Me." Not more than five hundred words on the above. Write on one side of paper, using pen and ink.

For Our Artists

3. Cartoons on the subject: "When the Pet Lamb Grew Up."

Use white, unruled paper and black or India ink. Remember, the contests close March 15th. Address your letter to Young People's Editor, Pennsylvania Farmer, 7301 Penn Ave., Pittsburgh, Pa.

Little Folks' Corner

The Story of Joe Poke

BETTY'S daddy had been cutting hay on the marsh and when Betty ran to meet him he said, "What do you suppose I found today?" Betty noticing he held one pocket very carefully, said, "Was it a little bunny?" Daddy said, "No it is an egg, a goose egg, I think. Put it under a hen and perhaps it will hatch."

Betty was delighted and ran to tell mother all about it. They put it under a hen that was sitting in an old barrel in the shed. Betty went each day to look at that egg, she was so anxious to see if it was going to hatch; she hardly expected it would, but it did, and such a fluffy yellow gosling! Betty kissed it on its little beak, and with a squeal of delight ran to the house to show her little pet. She called it "Joe Poke" because it had a habit of poking its little head all about and turning it sideways to look at her.

Joe Poke grew very fast. Betty put him into a box each night and during the day he was allowed to run about the yard. One day Betty's big brothers were playing in the yard and one

of them stepped on Joe Poke's foot, tearing a hole through the web that held his toes together. Betty was so frightened she ran and picked him up, bathed his foot and put some salve on it and it soon healed, but there was always a hole in it.

After Joe Poke grew up he would sometimes sneak into Daddy's corn field and begin stripping blades, then Betty would go out and call him by name and he would call back to her by saying "honk, honk," and come up to see if she had something to eat. Betty would sit on the grass sometimes and say, "Come here, Joe Poke, and get on my lap," and he would climb upon her lap and sit down, and poke his beak all about her dress like he was trying to fix a nest.

One day when her pet was about a year old Betty went into the chicken yard and was surprised to see Joe Poke sitting on a nest. She said, "What are you doing in there?" and putting her hand under her pet she found an egg. She ran laughing to her mother and said, "Oh! Mother just look. I thought Joe Poke was a daddy goose and she has laid an egg!" Aunt Belle.

PASSING EVENTS IN PICTURES

(Copyright by Underwood & Underwood)

1. London.—Stepping out!—in the feminine British manner—Miss Dewar, noted hurdler, caught in a fine action shot during her training at Battersea Park for the international games at Prague.

2. Chicago.—The "electromatic" traffic control was conceived in New Haven, Conn., when a young Yale professor, Harry A. Haugh, Jr., hurrying home late one night, was stopped at a pretimed traffic light, which was giving the right-of-way to an empty street.

Chafing at the unnecessary delay he began to ruminate on the possibilities of regulating traffic by mechanical means to its own volume and flow—in other words allowing it to run itself. In collaboration with three Yale asso-

ciates, Eugene D. Stirlen, David Geer and Wallace G. Garland, the new mechanical brain with its mechanical eyes was developed.

Photo shows Mr. W. R. Abbott, Jr., demonstrating the electromatic.

3. Long Beach, Calif.—Photo shows James R. Carter, Cleveland archaeologist, with Mrs. Carter, aboard the famous "Peary" yacht, which carried Commander Byrd and his plane into the Arctic for his flight over the North Pole, and which is being groomed for another adventure—to the east coast of Yucatan for a three-month investigation of the ancient Mayan ruins by Dr. Carter, Dr. George P. Engelhardt, biologists of the Brooklyn Museum of Arts and Sciences, and M. F. Bramley of Cleveland, who

is financing the expedition.

4. Long Beach, Cal.—A view of the largest oil derrick in the world, which has just been completed at the famous Signal Hill fields here. Reared to a height of 175 feet, this mammoth structure, almost three times the size and height of the ordinary ones, is expected to facilitate the lowering of a 10,000 foot shaft, since operations above ground are simplified by the greater working space.

5. Los Angeles.—A lineup of merry-makers ready for a thrilling toboggan race during the annual winter sport carnival at the Los Angeles County Park, near here, less than an hour's journey by auto from the orange groves of Southern California.

The Power Farmer's Spring Tooth Harrow—Built for Tractor Power

The John Deere-Syracuse Heavy Duty Tractor Harrow applies tractor power to big-capacity preparation of seed beds. It has the strength you need in equipment of this type, plus the good work advantage for which all John Deere-Syracuse spring-tooth harrows are famous.

Heavy-dimension, channel-steel frames; tooth bars shaped by special machines to insure great strength; thick, yet very resilient high-carbon steel spring-teeth, and heavy, straight grained oak drawbars with high carbon steel draft rods are outstanding features that make the John Deere-Syracuse Heavy Duty Harrow a dependable, profitable implement in power farming.

Frames are carried high over the teeth by the two rear shoes and front pivotal shoe. This construction insures prompt penetration under all conditions and freedom from clogging in trashy fields. The John Deere-Syracuse is built for good work and lots of it. The spring teeth dig deep, break up the lumps, mix the soil, kill the weeds and leave the field in fine condition for profitable planting.

Make it a point to see the John Deere-Syracuse heavy-duty harrow at your John Deere dealer's store next time you are in town. Have your John Deere dealer point out the many features that make it just right for tractor power. Write John Deere, Moline, Ill., for free booklet TH-836

Get this Economy in years of life added by COP-R-LOY

THE COPPER ALLOYED STEEL

Channeldrain Roofing proved its efficiency as a lightning-safe, waterproof, economical and permanent roofing long before COP-R-LOY, the Copper Alloyed Steel, came into such widespread use. But now in line with the Wheeling policy to give you the advantage of every forward step in manufacturing possibilities by which an improvement in durability is obtained, Wheeling makes all Channeldrain Roofing from COP-R-LOY, the Copper Alloyed Steel. You want absolute protection for your stock—you want it at the lowest price consistent with safety and permanence. Therefore you want this modern roofing made of this finer rust-resisting steel.

What Our Readers Say

TAXATION is the greatest problem confronting the farmers of Pennsylvania. It is the first place to look for relief.

Pennsylvania is a great industrial state, one of, if not, the wealthiest state in the Union, with only seven per cent of its population engaged in agriculture. If every industry would bear its just share of the burden of government according to benefits received agriculture would be greatly relieved.

While agriculture was the major industry of the state, it might have been justifiable to place the greater part of the burdens of government on land and real estate. Especially was this true when only real estate owners were entitled to vote, but we have long since outlived that state and real estate, especially farm-land, should long ago have been relieved from carrying an unjust share.

Here is something for economists to work on and find some plan of taxation that will more equally distribute the burdens of government. For a number of years our greatest farm organization, the Pennsylvania State Grange, through its Legislative Committee, used every effort to get some relief for agriculture and real estate, with little results. This organization will undoubtedly continue its fight and should have the cooperation, not only of every farmer in the state, but of every good citizen who believes in equal rights and justice.

Two Kinds of Land

The most burdensome taxes are local taxes, raised for the maintenance of schools and roads. As long as a six to ten mill tax was sufficient for their maintenance there was no complaint, but when it requires a fifty mill tax on an already depressed industry they became unduly burdensome. Here I shall confine my observations to conditions as they exist in Schuylkill county. There may be similar conditions in many other counties.

We have two kinds of land, farm land and coal land; the former can, under present conditions, be bought in many cases for less than the buildings are worth and no sale for it; the latter is very valuable and profitable; although not assessed nearly as high in proportion to its real value as farm land is, it pays a considerable tax. It so happened that the section where this rich land existed was divided into separate townships. Here they have but few miles of roads and plenty of money to maintain the very best of schools without burdening the people of the townships, as the coal companies pay most of the taxes.

The purely agricultural townships with low assessed valuations in comparison to the coal townships have about 75 per cent of the road mileage of the county to maintain for the use of the county as a whole. Every village is incorporated in a borough, thus placing the burden of maintaining the greater number of miles of roads entirely on the farmers, who constitute only about five per cent of the population of the county.

Just Distribution

This is a very important matter to be considered in any program of tax readjustment. As the roads are now largely used by the county as a whole, roads not taken over by the state should be maintained by the county. This would give considerable relief to our agricultural townships.

Next come the schools. The children of the farmers are entitled to all of the educational advantages that any other children enjoy. Here we meet with a like problem. The purely agricultural townships cannot compete with the richer coal townships or the manufacturing centers, where there is greater wealth.

The state makes liberal appropriations toward the maintenance of these schools, yet as long as the farmers are

paying a greater share of their total income toward their maintenance than is required in the industrial sections the state should give further aid so as to equalize the burdens, as the state as a whole rather than the townships gets the benefit.

With these readjustments and the assessment for taxes made on the income of corporations and individuals instead of on real estate, agriculture would enjoy the greatest relief and the burdens of government would be fairly and justly distributed.

John Shoener.

Schuylkill county, Pa.

Wants Justice

ALL the relief we farmers need is justice, spelled with a capital letter. What relief and aid do we get in paying four cents tax on the gasoline used in our tractors, gas engines and light plants?

Telephone and light companies can appropriate our lands for their use, but we cannot compel them to give us service except at prohibitive rates. I have the misfortune to be on a committee to confer with a certain company in regard to service. Their rates are beyond what we are able to pay. Yet they go through our lands. But, of course, they are trunk lines built only to connect one large town with another, not to serve us poor fellows who hear so much about needing relief.

The corporations can pollute our streams, but we farmers cannot place a pig lot across a small stream, or down from Harrisburg comes a man paid by somebody and tells us to remove same without delay. The above statement is an actual fact.

The township auditors are not trusted to appraise a few sheep killed by dogs. Down from Harrisburg or some other seaport, to investigate at some one's expense, they come. More relief.

Our auto fees are the same as the man who has his automobile on the road 365 days, and for weeks at a time the road is so bad we cannot get ours to a hard road, which is very good when we get to it, but is always good for the big fellow who travels from town to town.

If our lawmakers at Harrisburg and Washington, D. C., would give us an equal draw with the corporations we would not need a farm board paid a large salary.

D. F. Jones.

Phosphate on Corn

The first half of February we husked an eight-acre field of standing corn. This field had been unusually soft during the fall on account of excessive rains and the corn had evident opportunity to have fallen over. The corn had to endure an ice storm that put down 500 telephone poles in our county. Husking corn in February has always been taboo on our farm, to say nothing of leaving a field standing on the stalks most of the winter. We had been busy rebuilding a barn.

With this field of corn now in the crib we are sure we harvested more corn than we expected. We husked more corn than we expected, had it been cribbed in October. We purposely avoid kinds of corn with a heavy, coarse stalk. In the fall an experienced corn raiser took occasion to criticize our corn because the stalks seemed to him remarkably slender. Across the road from this field the standing corn fell over badly.

The day we planted this field of corn a customs trucker was sent to haul out twenty per cent phosphate and a team from off the farm was hired to drill 350 pounds of this fertilizer per acre ahead of the planter. Quite a number of fields of corn stood on the stalks until mid-winter around here, but we saw no corn that stayed up off the ground as well. We are convinced that the standing quality of

the stalks and the bright keeping quality of the corn were mostly due to the strengthening and maturing element in the superphosphate.

H. D.

About Hauling Manure

A COLD day recently while hauling manure we were reviewing the advantages over summer hauling. The advantages are pretty well summed up by the summer's work; they are a lot of kicking at flies as they wait for the load to go on. In winter the mules or horses are fresh and the manure hauling toughens them and gets them fit for the hard days of spring plowing.

The manure hauled out in winter is right to work for the farmer. The straw and stalks that he raised last summer are under the ground, producing crop growth again—you get a turnover of your humus every season instead of a leaching in the yard or a firing if the manure is uncovered.

On a bracing cool day in winter the man at the fork handle can do a lot of work—haul more loads in a day. With the manure crop largely out during the winter the farmer has more chance for a little vacationing in August between the rush of summer work and the corn-cutting season with fall seeding.

Thomas Jones.

Wants Rotten Manure

IN reply to Mr. Lighty concerning manure in the barnyard, there are two sides to this question. To improve land you need plenty of good rotten barnyard manure. Since farmers in our valley commenced to haul out their manure as fast as they made it their farms are on the decline. They do not raise the heavy wheat and red clover crops they did when they left their manure in the barnyard until it became a fertilizer.

You must have hay, straw and fodder to make nature's fertilizer. Nature has provided a process for all this raw material to go through to become a fertilizer, and that cannot be done in a few days or months. It must have time to become a fertilizer. By drawing the manure from the stable to the barnyard daily and letting cattle trample it solid, when weather permits them to be out, and with rain and snow to keep the manure pile moist, you get good manure. Keep good eave troughs on your barn. Then you need not fear your manure pile leaching away.

Take the leaves in the woods; do they receive a fertilizer to make that timber grow? The leaves go through the process the same as straw, hay and fodder is calculated to go through to become a fertilizer. There is nothing to leach away. It is all of dry nature.

H. S. Baker.

Blair county, Pa.

In Reply to H. D.

AN article in your paper by H. D. last week seemed to put hard times up to farmers on account of their lazy habits in contrast to their neighbors. I can remember back some twenty years when they were getting lumber out of this section. They did work hard, but they did not milk cows all winter.

We start to milk at 6 o'clock and keep lively to get the milk ready for the truck man at 8 o'clock. We take about 15 minutes for breakfast, after which time till 11 o'clock we are busy with the milk. Between then and 4 o'clock, if we have nothing special to do, we take it easy, after which we repeat the morning and forenoon performance. All of which goes to show that we put in over eight hours' work every day of the week, Sunday included.

What is true of us is true of every dairy farmer, only some of them work every day except Sunday. All this in the time H. D. supposes us to be doing nothing. Tell H. D. to visit some dairy farmer and see if he doesn't change his opinion. J. M.

Royster —for corn

"Harvested about 10 days ahead of my neighbors—yield about 110 bushels per acre, with good stover."

Royster FOR POTATOES

This year on twenty-five acres I had a certified yield of 400 to 500 bushels of seed potatoes. H. C. Andrews, Waterloo, N. Y.

Royster FOR ONIONS

2200 bushels of fine onions—part of a 15-acre yield. "A fertilizer that gives the highest yield possible." Ross & Di Santo, Savannah, N. Y.

Royster FOR WHEAT

This year my Royster fertilized wheat will average at least 40 bushels to the acre. W. S. Sheehan, Kennett Square, Pa.

Control SMUTS for Bigger Oats Yield

No Seed Injury with Easy Ceresan Dust Treatment

HEALTHY Ceresan increases yields by preventing smut losses.

Now is the time to choose between a good stand and big acre yields of oats this season, or poor germination and a short, smutty crop.

The annual smut damage inflicted on oats is very severe. Destruction of a fifth of the crop is not unusual. Sometimes the loss is even more. In 1929, state and federal authorities say, oats suffered more than normal smut damage in Wisconsin, Minnesota, Iowa, Missouri and Kansas. The preceding year, Iowa's loss alone was 18,000,000 bushels.

Control Smuts before Planting

Now, by seed treatment with Du Bay Ceresan, you can control both loose and covered smuts before you plant. Farmers and farm authorities know this from actual experience. For example, Wisconsin Circular 133 states that Ceresan has given very good control of oats smuts. The *Plant Disease Reporter* for August, 1929, reported that dust treatment with Ceresan gave "good control" of oats smut in Iowa, and in Kansas, Ceresan dust treatment gave "excellent control" of oats smuts.

Harmless to Seed

Easy Ceresan dust treatment puts an end to the risk of seed injury that is always present in the wet formaldehyde treatment, which sometimes injures as much as 30% of the seed. Ceresan destroys smut organisms on seed oats, but is harmless to germination.

Ceresan Increases Oats Yields

By preventing crop damage from oats smuts, Ceresan increases yields per acre. The Illinois Agricultural Experiment

Station said in a bulletin that Ceresan gave perfect smut control, increasing the yield on smutty 60-Day Oats by 13.8 bushels per acre and on smutty Big 4 Oats, by 19.1 bushels per acre over the yields from untreated seed. These increases were about double the increases obtained by formaldehyde treatment.

Also Controls Barley Diseases

Dust treatment of seed barley with Ceresan gives excellent control of stripe and covered smut and usually prevents seedling blight. An Illinois Experiment Station bulletin says: "For the treatment of these diseases, Ceresan seems to stand alone at the present time. . . . This treatment controlled all three diseases remarkably well." In another practical test, Ceresan gave perfect control of both covered smut and stripe disease and produced a yield increase of over 5 bushels per acre.

Ceresan dust seed treatment is also effective in controlling many seed-borne diseases of spring wheat; rye; sorghums, such as kaffir corn and milo maize; millet and cotton.

Quick and Easy Seed Treatment

Dust seed treatment with Ceresan is quick, easy and inexpensive. Only 3 ounces required per bushel of seed oats, barley or cotton; 2 ounces per bushel of seed wheat, rye, sorghums or millet. No muss or bother. Just dust it on according to simple directions. Bigger yields of better grain pay big returns on this small investment. Seed treated as long as a month before sowing may be stored safely. Ask your dealer at once for our free Ceresan pamphlet, or write to Bayer-Semesan Company, Inc., 105 Hudson St., New York, N. Y.

To Eliminate Waste

By R. U. BLASINGAME

As a general rule most all farmers in Pennsylvania begin plowing, disking, seeding, planting, cultivating, spraying, dusting and harvesting about the same time of the year. Now there are about 200,000 farms in this state; yet only about twenty-five or thirty machinery firms must furnish the repairs and take care of the sale of the new machines which are required.

If everybody waits for repair parts for plows, harrows, corn planters, sprayers, etc., until the day these machines are ready to be put to work somebody is going to be without. The local machinery dealer cannot afford to carry a full stock of repairs for every machine he sells. But he will be glad to order them ahead of time.

And the national farm machinery firms—those supplying equipment to all of the 6,000,000 farms in the United States—are up against it every season to supply repair parts all over the country. Remember this, therefore, if a part for a corn planter, for instance, is ordered at the rush period maybe several thousand other people are ordering at the same time. The only thing the factory can do is to possibly hire extra people to try to keep up with the repair business. These extra people are not as proficient in shipping repairs as the people who normally take care of this job. Consequently many delays occur and it goes largely back to the man who owns the machine and who does not order the part ahead of time.

One of the Major Wastes

Of course parts break in operation, which is unfortunate, but cannot be avoided. If machines are looked over in advance of their use there will not be so much loss of time and delay with farm operations.

I dare say that delays occasioned by machines being out of repair constitutes one of the major wastes in agriculture.

I was talking to the vice-president of a prominent sprayer manufacturer a week or so ago, and he said that the repair business was one of the most difficult jobs his company had to face. He had the following suggestions to make relating to the repair of and putting spray machines to work:

"This is the time of year to get sprayers in shape for the long grind next summer. Many growers keep putting off this task until spring comes, when suddenly they find themselves in need of their sprayers and they need work done on them. As a rule the outfit should be given a complete overhauling. It works under a tremendous strain and has very corrosive materials to contend with.

Go Over the Machine

"Take the first nice day and carefully go over the machine. Then make up an order for the repairs that you need and either take it to your dealer or send it to the factory where the sprayer was made. We might suggest that a pencil and paper be kept in the tool box throughout the spraying season. Let the operator make notes on this paper of what repairing needs to be done and what parts need to be ordered before the next season. In case he leaves your employ, you will have a record to go by. Even if you run the machine yourself you will find it handy to make a record of this kind.

"The engine should be carefully gone over. Remove the carbon, grind the valves and check their timing, take up any bearings which are loose, and see if new piston rings are needed. Most gas engine troubles are ignition troubles. Check the timing of the spark, use a good spark plug and keep it free from carbon. Look for a short circuit in the wires where they may be rubbing on the engine. If the magneto is in need of attention

You Can Make EXTRA PROFITS

with a thresher like this

A. All-steel cylinder
B. Adjustable concaves
C. Non-clogging finger
grates
D. Counterbalanced
straw rack
E. Smooth grain pan

better send it to a service station now; then it will be ready to go next spring. If your engine uses batteries and you get new ones do not leave them in a damp place. See that the coil functions properly.

"The bearings on the pump should be taken up if there is any looseness in them; perhaps a few new bushings will be needed. The plunger packing may leak and need replacing. The gaskets and valve seats may be in a bad condition and need to be replaced. These may be needed at any time during the spraying season, and it is well to keep extras on hand all the time.

Ready for Spring

"The pressure regulator may need attention. Don't fail to keep it well covered with oil or greased on the outside so as to prevent corrosion which might make future adjustments impossible. If you use fine hoses in the nozzle disks, it may pay to replace all the piping on the outfit, for there is bound to be rust which will come loose inside of old pipes and make trouble by clogging the nozzles. Now is the time to repack or replace that leaky agitator stuffing box.

"The sooner you order needed repairs the better. Then you will have them and be ready to go ahead and overhaul your machine at some time when the weather is favorable and when it will be convenient to do it in connection with your other work. It is surprising how many growers wait until the day they want to spray and then discover that their machine is not ready to run.

"And don't forget to get any hose, nozzles, nozzle disks and other equipment which may be needed. During the spring manufacturers are so badly crowded with orders that they cannot always ship as quickly as you would like. Sometimes these late, hurry-up orders are lost or damaged in the mail. Let's order now and be ready to go when spring opens up." Opportunity waits on preparation!

A Water System

As our storage supply is only 17 gallons we now intend to build a concrete storage cistern entirely under the ground with 18 inches of ground on top of cistern, in order to keep water cool in hot weather and prevent freezing in winter.

The location of this cistern will be 20 feet from well and elevated 21 feet at bottom of cistern or 32 feet at top of cistern, where discharge would empty into cistern eight feet deep and eight feet in diameter.

Walls are to be ten inches thick composed of one part cement, three parts sand and three parts fine gravel. Or would you make some alterations in proportioning this mix?

We intend using 1 1/2-inch pipe for discharge and 1 1/4-inch from cistern to barn to watering trough and drinking cups for dairy.

Will a one and one-half horsepower gasoline engine be satisfactory for pumping this water? Please let me know how much pressure we would have at house and barn? W. E. Hawthorne.

I do not think that the walls of your concrete tank should be thicker than six inches. You can make water-tight concrete by using about six to six and one-half gallons of water to each bag of cement. Then put into this mixture of cement and water as much stone and sand as it will hold and still make a workable concrete. If the sand and stone are wet use less water.

With regard to pressure that you will have in your pipe at any point below the tank it can be secured by multiplying the height in feet by .434. This means pressure per square inch. Suppose that you were ten feet below the tank, your pressure would be 10x.434 or 4.34 pounds per square inch.

I think that a one and one-half horsepower engine will be ample in size for your needs. However, it would be a good idea for you to write to the manufacturer of your pump and give him the size of the cylinder and the height to which you will lift water. I think the pipe from the pump to the tank should be the size for which the pump is tapped.

THE difference between making a good profit in threshing or just breaking even is often a matter of preparedness. You can make extra profits with a Case Thresher because with it you are prepared to thresh efficiently all kinds of grain, even when conditions are difficult.

An adjustable height of feeding that enables you to thresh wet or tangled grain more easily is an advantage that no other thresher can give you. The Case has many other valuable features that assure you of better threshing and more thorough separation and cleaning.

1. The all-steel cylinder is accurately balanced. The perforated concaves are also of steel construction and unbreakable. The adjustable height of feeding, together with the adjustable concaves and correct spacing of teeth, permit clean threshing of the toughest grain without slugging and with very little power.

2. Non-clogging steel finger grates make complete separation certain. . . over 90% of the grain is removed from the

straw even before it reaches the straw rack.

3. Counterbalanced straw rack and grain pan do their work thoroughly and smoothly.

If you grow threshable grain or seed, you will find it very much worth while to learn more about the profit-possibilities of a Case Thresher. Mail coupon for free copy of "Bigger Profits by Better Threshing," a fully illustrated book every grain grower will enjoy reading.

WHEN you go into town on Saturday for the week's buying, how do you go about it? The chances are that your mind is pretty well made-up—not only as to general description of the products you want, but as to the brand names. You'll mention familiar merchandise easily, naturally. Names of advertised goods.

You prefer advertised goods because you know you can depend on them. You save hours of shopping time in a year because you don't need to investigate or examine the things you want. You don't buy on suspicion—you buy with confidence—because you know goods that are consistently advertised must maintain consistent quality. It is ruinous for a manufacturer to turn the spotlight of advertising on an inferior product. And advertisers know it. Hence advertising is a guarantee of dependability.

Farmer's Business Letter

A STRIKING feature of the hog market this week was the quick response of producers when prices slumped. They promptly cut off receipts. The run here this week was only 160,000, against 209,000 last week. Eleven markets had 575,000, against 671,000 last week.

Smaller receipts the latter half of the week put prices back where they had been at the opening of the week, which was the high point of the season. In spite of the midweek slump the average price for the week at \$10.50 was five cents above last week. It was 35 cents higher than a year ago when the market was on the upgrade, and \$2.75 above the weekly average two years ago.

From what is known of supply and demand conditions, the position of hogs is so strong that there is danger of the trade going to extremes in bullish sentiment. It is to be noted that marketing at the eleven leading points so far this year is smallest, with three exceptions, 1926, '27 and '22, since 1914. For the first half of this month the eleven markets received 1,373,000 hogs, that number comparing with 1,530,000 a year ago and 1,841,000 two years ago. The number of mixed hogs, usually in evidence toward the end of the winter season, is larger at this time than it was two weeks ago. Farmers are picking up hogs where they can, and sows are selling in pure-bred sales better than in a long time.

Lambs Higher
The lamb market made a gain this week, for a change. It was welcome relief from the downward swing, though of course prices did not advance enough to let shippers out. Lambs advanced as much as \$1, though on most kinds the net gain was under 50 cents. Average price for the week was figured at \$11, a gain of 35 cents over last week, but still \$5.20 under a year ago.

The market was helped by quite a shrinkage in receipts. The run here totaled 70,000 against 82,000 last week, and the combined totals at leading points were about in the same proportion. This helped, as did also lower prices for lamb reflected to consumers, and perhaps in addition the protests against low prices brought before Chicago packers by the personal representatives of western feeders.

Most of the decrease in receipts this week was due to Colorado feeders holding back, to give the market a chance to pick up. They sent only 21,000 lambs to Chicago against 28,500 last week. It is generally felt, however, that there are still plenty of lambs to come, and no one, so far as your correspondent can ascertain, expects any material improvement in prices in the near future.

Cattle Mostly Lower
The cattle market was weak this week, and prices except for a few steady spots were some lower. The bulk of steers was 25 to 50 cents lower, and butcher stock as much as \$1 lower. The market thus showed its inability to absorb much of an increase in receipts.

The run here this week at 42,000 was about 6,000 larger than last week, though a little smaller than the same week a year ago and two years ago. In spite of the weakness that has prevailed in the market for some time,

the fact should not be overlooked that cattle prices are high.

The steer average, as figured this week, is 50 cents above a year ago, and the bulk of steer sales, at \$11 to \$14, compares with \$11 to \$13 a year ago, and outside of 1928, when bulk was \$11.65 to \$14.35, highest since the war years. A little more optimism was evident in the trade this week, based on the promises of improvement in general business conditions.

Demoralized Wheat Trade

The downward swing in wheat prices was checked at the week end, still there is no certainty about the future. Demoralization was evident in the wheat markets of the entire world.

The Farm Board's Stabilization Corporation, said to hold about 10,000,000 bushels of wheat, was thought to have a loss on it of around 10 cents a bushel, or \$1,000,000.

Wheat for March delivery at Chicago showed a loss of 54 cents from the high point last summer. Europe seems set against buying any more wheat than necessary on this continent, due to the artificial price influences brought to bear. On Jan. 1 it is figured there was approximately 580,000,000 bushels of wheat in all positions in the United States, of which bread and seed requirements would probably take care of only 295,000,000 bushels during the last half of the crop year. On July 1, 1929, the carry-over into the new crop aggregated 245,000,000 bushels and relatively little change is expected to be shown at the end of the present season.

LIVESTOCK

PITTSBURGH

Cattle

Monday's supply was light, only about 30 carloads, but it included some very well fed steers. Buyers bid lower prices on the good fat steers but in the end paid about the same figures as last week, in some cases getting better cattle than then for the same money. One load of well finished 1,312-pound steers brought \$12.50 and a few loads of good fat steers \$13.00 to \$13.25, both handy and weighty kinds going at this range. Very nice handy-weight butchers steers brought \$12.50 to \$12.75, not many good enough to beat \$12.25. Light and medium quality steers looked lower, few light kind going at \$11.25 to \$11.50 and ordinary light killers \$10.50 to \$10.75. A few steers and thin cows were picked up to go to the country, the cows costing \$6.75 to \$7.25. Heifers were not numerous and easier, few selling above \$11. Fat cows showed little change, but not many brought over \$8.50, an occasional one \$9 or a little more. Canners went at \$4.75 to \$5.25, largely at \$5. Bulls were lower, with \$9.50 the outside figure for butcher bulls, most of these \$9 to \$9.25 and bolognas generally \$8 to \$8.50.

Prime fat steers \$13.00 to \$13.50
Choice steers, 1,300 lbs. or over \$12.50 to \$13.00
Good to choice, do. \$12.00 to \$12.50
Fair to good, do. \$11.50 to \$12.00
Plain heavy steers \$11.50 to \$12.00
Choice handy-weight steers \$12.25 to \$12.50
Good butcher steers, 1,000 to 1,150 lbs. \$11.90 to \$12.25
Fair to good, do. \$11.50 to \$11.85
Ordinary to fair, do. \$11.00 to \$11.50
Common, do. \$10.50 to \$11.00
Good light butcher steers \$11.25 to \$11.75
Fair to good light steers \$11.00 to \$11.25
Common to medium, do. \$10.50 to \$11.25
Inferior light steers \$9.00 to \$10.00

Pork Production Record

A Minnesota farmer with 11 sows produced in 180 days an average of 2,222 pounds of pork per sow. This is the highest official record that has ever been made in Minnesota. The 11 Chester White sows farrowed 151 pigs, of which 120 were raised to an average of 203.6 pounds in 180 days. The total of 24,653 pounds of pork was produced at a total feed cost of \$1,061.25, or 4.3 cents a pound. This did not include labor or pasture. They sold for \$9.10 a hundred.

Will Not Hold Butter

Members of the Land of Lakes Creameries, Inc., who hold their annual convention March 12-13, will be informed that the funds secured from the Federal Farm Board will not be used primarily to hold butter off the market so as to bring stability.

"We cannot by ourselves hope to shoulder the burden of possible loss," declared A. J. McGuire of the management. "Unless more cooperative creameries agree to join in this movement it will be difficult for a single group, no matter how strong, to undertake a line of work which should be supported alike by all."

"It is evident that the dairy industry is facing a butter surplus which will control the entire market price situation to a large extent. If all the cooperative creameries here in the Middle West—Minnesota, Iowa and Wisconsin—were working together they could control the surplus they produce, and which would have a stabilizing influence on the market. We hope that all the cooperative creameries will see the necessity of working together," he stated.

Chicago, Feb. 22, 1930. Watson

FEEDERS

Stocks Nominal
Choice fat heifers 11 00 to 11 50
Good to choice 10 25 to 10 75
Fair to good 9 50 to 10 25

Hogs

At the close of last week sorted handy-weight hogs sold up to \$12.15. Monday's supply was 30 double-deck carloads. Trade was rather slow but all were sold at a decline of 20 to 25 cents per cwt. Heavy weights brought \$11.40 to \$11.50, but extreme weights would not go above \$11.25. Heavy mixed sold largely at \$11.60 to \$11.75, handy-weights at \$11.85 to \$11.90 and light at \$11.25 to \$11.50. Anything good of 150 lbs. or over going along with the handy weights. Sows were all wanted at \$9.75 for good ones.

Heavy \$11.40 to \$11.50
Heavy mixed \$11.60 to \$11.75
Medium wts., 180-200 lbs. \$11.80 to \$11.90
Heavy Yorkers, 165-180 lbs. \$11.80 to \$11.90
Light Yorkers, 125-150 lbs. \$11.25 to \$11.50
Pigs, 90-110 lbs. \$11.00 to \$11.25

Roughs

9 25 to 9 75
Stage 6 00 to 6 25

Sheep and Lambs

Last week's market was bad and this week's opened worse. Monday's supply was around 16 double-deck carloads, mostly lambs. Bids were lower on all kinds of lambs. A couple of decks went to local buyers at \$11.50, but the market for good heavy-weights was generally on a \$11.25 basis, culls and heavies out, and the rest was rather severe at that. One double of handy-weights brought \$11 straight, another including heavies \$10.65 straight, and \$11.25 was bid for some choice lambs that contained a few overweighters. Medium class sold at \$10 to \$10.25 and culls at \$9.50 to \$10.50, the latter for those not much in excess of 90 lbs. and the inside figure for choice heavier kind. A few clipped lambs appeared and sold on the basis of \$10 for good handy-weights. Sheep were dull but few were offered. They would have to be choice to beat 57 per cent, as the cheapest of heavy lambs is against the sheep market. Clipped sheep would probably sell on a \$6 basis but not enough appeared to make a market. No spring lambs have come in yet.

Good to best wethers \$6 75 to 7 25
Good mixed 6 50 to 6 75
Fair to good, do. 5 75 to 6 25
Common to fair 4 50 to 5 50
Inferior sheep 4 50 to 5 00
Good to best lambs 11 00 to 11 25
Medium lambs 10 00 to 10 50
Culls and common 8 00 to 9 50
Heavy lambs 9 50 to 10 50

Calves
Monday's supply was about 650 head. The market was unchanged at \$15.50 for tops, \$11 to \$13 for seconds and \$8 to \$10 for culls.

CHICAGO

Cattle

Chicago, Feb. 24.—Today's receipts amounted to 14,000 head. Better cattle; others weak to a quarter lower.

Common to fair steers \$9 50 to 11 25
Fair to prime yearlings 11 25 to 11 50
Fair to prime cow-feds 11 00 to 11 50
Cows 6 00 to 7 50
Heifers 7 00 to 8 00
Bulls 4 25 to 5 75
Canners and cutters 4 25 to 5 75
Calves 9 00 to 10 50
Stockers and feeder heifers 8 00 to 9 50
Feeder steers 8 00 to 9 50
Stockers and feeder cows 6 50 to 7 50

Hogs

Sixty-two thousand head, including 13,000 "directs," made up the supply. Market 10 to 30c lower with top at \$11.50. Bulk sold at \$10.25 to \$11.25.

Top pigs \$10 15 to 10 50
Underweights, 140-160 lbs. 10 00 to 10 40
Light, 160-180 lbs. 11 00 to 11 40
Light butcher, 180-220 lbs. 11 00 to 11 40
Medium butcher, 220-260 lbs. 10 50 to 11 40
Heavy butcher, 260 lbs. up 10 50 to 11 40
Stags, 70 lbs. deck 8 00 to 9 00

Sheep

About 19,000 sheep and lambs were on sale. Market 25 to 50c lower. Best lambs sold at \$11.70, bulk at \$10.50 to \$11.25.

Native lambs \$7 50 to 11 25
Western lambs 9 25 to 10 25
Feeding lambs 9 50 to 10 25
Wethers 4 75 to 5 25
Yearlings 6 50 to 8 25
Ewes 2 50 to 6 00
Shorn stock 50c to 75c below figures.

LANCASTER

Cattle

Lancaster, Feb. 24.—About 500 head of cattle were on sale. The market was slow and generally steady. Best steers held at \$12.25, while bulk went at \$11.25 to \$12. She-stock weak; bulls steady.

With 175 calves on sale the market was steady to weak. Top vealers sold at \$16.

Hogs

Nine hundred head were offered. Market steady with top hogs at \$12.75.

By Lett

Al Acres—He must have been in a hurry

Philadelphia Produce Review

THE Philadelphia egg market opened easier during the past week and on Tuesday sharp declines were registered on all grades. The price adjustment was generally looked for, since the market has shown a nervous undulation for some time. As the week progressed a steadier tone was noted but not enough to indicate any material strength. Supplies have been heavier than for any time during the current month and in most quarters moderate stock was carried over from day to day.

The New York egg market also declined but showed steadier tendency toward the close. Nearby mixed colors were quoted at 30 to 35c per dozen, whites at 35 to 41c and browns at 38 to 40c.

Poultry

Live fowl declined on the New York market during the latter part of the week due to heavy receipts and to the unseasonably warm weather. Consumption appeared to have fallen off considerably and trading was light. Chickens met a fair demand and fancy Rock broilers were wanted. Capons and hen turkeys were scarce. Colored fowl brought 28c per pound and Leghorn fowl 25c. Chickens brought 23 to 25c, pullets 25 to 35c and capons 26 to 42c. Nearby dressed hot house broilers were firm with light offerings. Fowls were in liberal supply but many dealers placed stock in storage rather than accept lower prices.

Potatoes

Potatoes were in rather liberal supply in most city markets this past week as the result of shipments averaging around 800 cars daily. The holiday on Saturday along with the regular week end is likely to result in further accumulations at terminal markets, especially when coupled with Thursday's shipments of over 1,000 cars.

The demand is slow with buyers pursuing a very conservative program. Shipping point markets showed a weaker tendency late in the week with Maine reporting sales of Green Mountains at \$2.10 to \$2.20 per 100-pound sack f. o. b. Maine has exceeded her last year's output by about 50 per cent and it seems likely that the total will be over 50,000 cars.

Prices averaged somewhat lower in Philadelphia this past week with Pennsylvania round whites ranging from \$2.50 to \$3 per 100-pound sack with less stock bringing \$3 than a week ago. Several cars of well-graded stock of good quality from Lebanon county have topped the market at \$3.50 per 120-pound sack. The average receipts have brought \$2.75 to \$3.35 per 120-pound sack. Sweet potato shipments have been averaging around 50 cars daily with Delaware and Tennessee supplying more than one half of the total. The market in most cities was rather quiet, except for extra fancy stock. New Jersey yellows sold at 90 to \$1.10 per bushel in Philadelphia while New York City reported \$1.25 to 2 per bushel with a few fancy lots reaching \$2.50. New Jersey stock also sold at \$2.50 in Chicago.

Apples About Steady

The apple market generally was quiet and held steady. There was a gradual advance during the first two weeks of February but there did not appear to be much tendency toward higher prices this past week. In general the demand is slow with active competition with liberal supplies of oranges on most city retail markets. There is a scarcity of strictly fancy fruit. Yorkers are meeting a somewhat better demand and there were some good Pennsylvania Yorkers that sold at \$6 per barrel in Philadelphia this past week. Yorkers in a way are selling at rather high prices, especially when compared with such varieties as Stayman and Winesap. New Jersey and Pennsylvania Yorkers sold at \$1.25 to \$2.25 in Philadelphia while Stayman brought \$1.50 to \$2.50.

There was some domestic cabbage sold in western New York at \$75 per ton this past week, setting a new high level. It appears that there are very few carloads of cabbage left in the North and remaining stocks are held at still higher prices. According to a report issued by the Federal Market News Division, the position of the old cabbage market has been helped by the poor grade of a large part of the southern cabbage which often reached

northern markets in rather poor condition and was light in weight. For this reason much trade was diverted to the more solid New York State stock. A few more carloads of Holland cabbage have been received at New York, Philadelphia and Baltimore.

Free Power for Pumping

A stream, spring or artesian well will operate a Rife Pump and pump water for house, barn, garden, swimming pool or fountain. No fuel, oil or electric current needed. Can use air pressure or open tank. For more information, write Rife Hydraulic Mfg. Co., Dept. C, 30 West St., New York City.

In the Pennsylvania Farmer are Names

—names of advertised products. Time and again you see them. They are like old friends—to be trusted. Their names mean economy, full value and integrity. Tell the manufacturer you saw their ad in Pennsylvania Farmer.

Mr. Amandus Larson, left, and his son, of Ridgway, Elk Co., Pa., with some of the potatoes grown last season with AGRICO, the premier "AA QUALITY" Fertilizer. Their crop averaged 310 bu. per acre, or 185 bu. per acre above average.

185 bu. MORE Potatoes Per Acre

LAST season the average yield of potatoes in the vicinity of Ridgway, Elk Co., Pa., was about 125 bushels per acre. Compare this with the yield obtained by Amandus Larson & Son, of Ridgway, who wrote, on Jan. 3, 1930, as follows:

"Our potato yield in 1929 was estimated early in August to produce over 400 bu. per acre. Had weather conditions held favorable, the crop would have been a record-breaker. As it was, our yield was 310 bu. per acre of clean, marketable potatoes. The first 50 bu. harvested sold for \$2.40 per bu., and the re-

mainder brought \$1.90 per bu., whereas the average yield in this community was 100 to 125 bu. per acre and the price \$1.60 per bu. or less.

"Even with poor weather conditions, our 1929 crops, grown with your AGRICO, were the best we have ever had. We intend to use AGRICO exclusively in 1930 to make our soils more productive and to increase our yields and profits."

130 Bu. of Corn Per Acre

Results like these are by no means exceptional where AGRICO and the other "AA QUALITY" Fertilizers are used. Every kind of crop planted in this locality shows similar results. Take corn, for instance. Mr. L. S. Hummel, Manager of Rolling Rock Farms, Ligonier, Westmoreland Co., Pa., reports a yield of 130 bu. per acre from 24 acres grown with "AA QUALITY" Fertilizer. The average yield in that locality was 75 to 95 bu. per acre.

Mr. Hummel wrote, on Dec. 16, 1929: "Our yield averaged 130 bu. per acre. The ground is rather thin, but the ears were filled out with kernels, clear to the ends of the cobs. This we credit to your Fertilizer. We have made comparisons with other makes of fertilizer and 'AA QUALITY' always proves the most profitable."

"AA QUALITY" Fertilizers produce bigger crops of better quality because they are compounded and blended to provide a continuous supply of available plant foods throughout the entire growing season.

Try "AA QUALITY" goods this year. There is a dealer near you. See him this week.

"AA QUALITY" Fertilizers

Manufactured only by

The AMERICAN AGRICULTURAL CHEMICAL Co.

Baltimore, Md. Buffalo, N. Y. New York, N. Y.

Every dollar you save in your purchases is a dollar added to the profits of your farm.

Every dollar spent for unsatisfactory merchandise is a dollar added to your costs. Read the advertisements and be guided by them.

ANSWER THEM and say you saw their advertisement in the Pennsylvania Farmer.

Mr. Woodchuck's Views

IN our pasture field, close to a good spring and not far from a clover field, lies a large stone, under which a couple of groundhogs have made their home for years. Being tired of salt pork, I took the gun and sallied forth on the morning of February 1, thinking to procure a woodchuck for dinner.

The sun was shining bright though the air was crisp and cold. When I approached the boulder I heard a rushing of dry leaves and Mrs. Chuck said: "Nebuchadnezzar, get up! It's February 1 and you've slept for three months. We must not disappoint the people by not telling them what the weather will be. The baby has been restless for six weeks." Old Neb, man-like, grunted and rolled over. Soon Mrs. Neb. stuck her head out, retreated and said: "Oh, Neb. There's a horrid man outside with a gun.

Soon Neb's hoary head appeared, necktie awry, and said: "Come on, it's nobody but the old Jigger. He couldn't hit the side of a barn."

A High Record

This rather riled me, as I have an almost 100 per cent record as a sportsman, never having missed a bird and but one rabbit. (I never shot at a bird and at but one rabbit.) They dived in the water and, like a couple of kids, tried to drown each other, splashed and squealed and were so emaciated and appeared so happy I did not have the heart to shoot.

I told old Neb. that I represented the Pennsylvania Farmer, the best rural paper published in the state, and as the chucks were all ruralites and the paper, knowing he was an influential citizen of the chuck republic, sent me to procure a short interview.

He said before the white man came they had good times. Their republic extended from the Great Lakes to the Gulf and to the Mississippi river. "Being vegetarians, we lived at peace with all the other animals. We could easily outwit the Indians and could choose homes in the most advantageous locations.

Would Petition Congress

"But the white man cleared the land and removed the stones and dried up the springs, and with his high powered rifle he can shoot us from a half mile. His kids and dogs take pride in worrying us, and now when meat is high and so many men out of work we are hunted for the few pounds of savory meat in our carcasses. But we are in hopes that Senator Grundy will feed the infant industries of Pennsylvania plenty of protection, so they can give employment to would-be sportsmen. If not there will soon not be enough of us left to prognosticate the weather.

"We are going to petition to Congress to compel the farmers to at least leave one stone pile or boulder in each field for a house of refuge, and as all other meat or fur-bearing animals are protected, we want at least ten months of the closed season on groundhogs. The open season to be December to January.

"Our quarters are getting somewhat crowded and after breakfast we intend to spy out locations for homes for some of our boys. But Samantha is calling for breakfast and I find it saves trouble to obey Samantha promptly, so au revoir."

O. C. Sigworth.

McGuffey Readers

THE McGuffey readers and Ray arithmetics that many of us studied during our young life were milestones, but we have not realized it until now. That is what we often hear these days. I sometimes wonder if there isn't more than a grain of truth in such statements.

"Compare the McGuffey readers with those of today," one very scholarly man remarked. "The latter are a mess of fairy tales woven so thin they are not even plausible. And the modern arithmetic! Why, if it wasn't

What Bonds Shall I Buy?

HUNDREDS of thousands of investors have answered this question by purchasing in the last 12 years more than a \$1,500,000,000 worth of Federal Land Bank Bonds mutually guaranteed by the Twelve Federal Land Banks under the conditions stated in the Farm Loan Act. Backed by first farm mortgages upon hundreds of thousands of farms, these bonds offer conservative investors all the features deemed desirable in long-term, safe investments—stability of income, ready collateral, marketability, desirable maturities, and tax exemption. These features are reflected in the interest rates. Interest is paid semi-annually.

The 12 banks have total capital, legal and other reserves and undivided profits, aggregating more than \$84,000,000. Their total assets exceed \$1,300,000,000.

Although operating since 1916, through the worst depression ever experienced by agriculture, the net carrying value of the real estate, sheriffs' certificates and other items owned by the Twelve Mutual or Cooperative Federal Land Banks on November 30, 1929 was only 1.1 per cent of their assets. This mutual system—the 12 banks and 4662 local National Farm Loan Associations—affords the investor the added security of diversification, for it operates not in one or two states, but throughout the United States.

From time to time these 12 banks make offerings of their bonds. Write the nearest Federal Land Bank or the Fiscal Agent for Circular No. 16.

that there are still some of Ray's old arithmetics lying around we would be lost in a labyrinth of Chinese puzzles that have been substituted for arithmetic.

"In the McGuffey books almost every lesson was an inspiration to the youth. The McGuffey readers gave lessons of temperance, spiritual lessons, love of home, honor of parents, Paul's sermon on Mars' Hill, Christ's sermon on the Mount and stories and poems touching every phase of life."

This man continued: "If you had McGuffey in the schools today there would be no trouble about the reading of the Bible in classrooms, and I believe the next generation would see less crime in our country." McGuffey's readers first appeared in 1836 and were in use until 1907. McGuffey taught in the University of Virginia from 1845 to 1873. He died there.

Within recent years McGuffey societies have sprung up about the country to perpetuate the associations and ideals inspired by the once common study of these famous textbooks of the "little red school." And there is a reaffirmance of the McGuffey theory of educating young America on every hand.

But Times Change

We all have a warm place in our hearts for the McGuffey readers and Ray's arithmetics, but I cannot exactly agree with this man who related the above story to me.

I believe in the McGuffey societies very much and would like to have such a society in our section of West Virginia, but I would not be in favor of adopting the books again as textbooks in our schools.

The McGuffey readers and Ray arithmetics served their purpose well in their day and molded many fine characters, but we are not living now as we did in 1907 or 1836. Neither are our schools as they were then, so it would be turning our school system backward to return to McGuffey readers and Ray arithmetics as a basal text in our public schools.

I have a set of McGuffey's readers and money won't buy them, because I cherish them so highly, but I must confess our present day readers are more practical than McGuffey's readers for our rising generation.

I hope we shall hear from other readers on this subject.

C. B. Alliman.

Marshall county, W. Va.

Warning About Bulls

I HAVE been reading the fatal assaults by bulls and think it time to give warning. Don't trust a bull, not even a quiet or a tame one, for he is liable to change his mind. Keep out of the bull's stall and don't lead him to water, but carry water to him, or go in the entry and loosen the chain at the trough. When you want to tie him, put feed in his trough and tie him from the entry.

The tame ones are just as dangerous as the cross ones. If you have to drive them, take a dog with you. Some one asked if a dog can think. I say yes. We have a bull-terrier that thinks quick and is always willing to be of help. The cattle are all afraid of him, as he bites at them. I raised a good many calves, bulls and heifers, and made pets of some. When they became older the pets were more dangerous than the ones I did not pet. One knocked me down into a gutter of briars. She did not appear to be cross, but I did not dare to drive her, as she was always ready to make a dive at me. We had another that would paw with front feet and roll her eyes and try to jump the fence to get after me, and I never insulted her. We had a bull tied between two milk cows and I had to be very quiet, as he would kick at me, so I won't risk it any more.

Mrs. J. L. Weigand.

Adams county, Pa.

Here Is an Easy Way to Make \$1,000.00

If you were putting a new soap on the market what would you call it? You would give it some name—either simple or fancy—what would that name be? I know you have a name in mind now, or you can suggest one after a few moments' thought. The very name you select may win the \$1,000.00 I am offering. It makes no difference whether you live in the country or city, if you are educated or not, if you are rich or poor, I want you to help me by suggesting a name for my new soap. We have paid thousands of dollars to prize winners and in almost every instance the person who first expected to win received a prize. You, too, may win by sending a suggestion. It costs you nothing to try. You have everything to gain and nothing to lose, for any name may win. This soap is fragrant, lathers freely, promotes a smooth soft skin, is excellent for the bath, washing the hair, etc. A coined word such as Clean-Easy, Cloth-All, or the name of flowers, trees, etc., or any other name you think of may be submitted.

Absolutely Nothing Else To Do

Remember there is no obligation. The person sending the name we choose will win this handsome prize. Nothing to buy or sell—nothing else to do to win. Think of the pleasure this prize can bring you, the places you could go, the things you could buy, with \$1,000.00, or \$1,000.00 cash, if you are prompt. Wouldn't it be delightful to win? Wouldn't it be a pleasant surprise to your friends? Don't think you can't win for your opportunity is just as good as anyone's. If you will send in a name. Do it right now! For the very name you send may win.

YOU CAN'T LOSE

because other contestants submit the winning name first, as we will give duplicate prizes to all who send the winning name. If the name you send wins, you will receive \$1,000.00 regardless of how many other people have submitted the same name. This means you can't lose by others submitting the winning name first.

\$100 Extra For Promptness

To get quick action we are going to pay the winner an extra \$100.00 for promptness, or \$1,100.00 in all—no send your suggestion AT ONCE!

CONTEST RULES

This contest is open to everyone except members of this firm, its employees and relatives. Each contestant may send only one name. Sending two or more names will cause all names submitted by that person to be thrown out. Contest closes April 30, 1930. Duplicate prizes will be given in case of a tie. With the promptness prize of \$100.00 extra, the winning name suggested must be mailed within three days after our announcement is read.

Mr. G. B. Blake, Contest Manager, Dept. 188, 715 Fifth Ave., Des Moines, Iowa. Enclosed with this coupon on separate sheet is my suggestion for a name.

HOG DRESSED 783 POUNDS

Enclosed you will find a picture of William O. Adams and son of Dauphin county, Pa., and their Chester White hog. The hog at 30 months of age was seven feet from stem to stern, 3 feet 4 inches high and dressed 783 pounds when killed on February 13, 1930. **W. O. A.**

Dry Beds for Young Pigs

THE spring farrowing season is at hand. This season of the year is beset with a lot of rain and dampness. Keeping the pig nests dry is a real job. On most farms it is a job to be planned beforehand. About the only way to have straw dry enough for young pigs is to have a supply inside and under cover several days in advance of its need.

Straw may appear dry and still harbor a lot of moisture. I once weighed several loads of straw for a farmer buyer—he bought the whole stack, to take only the dry straw. The whole top was thrown off until the pitchers came to satisfactory straw, yet in the end this first load was five hundred pounds heavier than the largest subsequent load that could be put on. The loads decreased in weight right down from the top, only the bottom and core of the stack being really dry straw.

It is just about right to say that straw which has been under a litter of pigs twenty-four hours is damp straw. When little pigs begin to root their way into and under the bed it should be a danger signal, in fact it is a sign of neglect that the bed had not already been renewed. You may not lose the pigs outright by reason of these damp beds, but you lose the pig blood that keeps them active and thriving. **G. P. W.**

Better Flock Contest

TOGA county sheep and wool growers this year will repeat the better flock contest which proved so successful last year, according to W. B. Connell, sheep and wool extension specialist of the Pennsylvania State College.

Features of the schedule of management demanded in the contest include drenching, docking and castrating, use of a pure-bred ram and the maintenance of the flock health. At the conclusion of the contest three fleeces must be shown by each contestant, and he must also exhibit a pen of three lambs and their sire. It is planned to hold a ram sale in connection with the round-up in the contest.

Hot-House Lambs

ALL of last season's lamb crop, except a carload of May-born Delaines now in my feed lot, has been marketed. A few farmers here have begun experimenting with hot-house lambs. E. S. Myton owns a band of medium-wooled ewes, which gave birth to 30 lambs after January 1, 1930, while 23 Delaine ewes in my pens have 24 thrifty Dorset-Delaine lambs. The first lamb was born December 4 and now will tip the beams at more than 30 pounds. Out of 27 lambs born we succeeded in saving 24. Twelve ewes had second-crop lambs.

TOO VITAL TO BE OVERLOOKED IS TODAY'S NEED FOR FENCE

Your farm is similar in many respects to a large manufacturing concern. Just as the management of a factory must plan floor space and machinery so as to secure the greatest possible production—you, also, must plan to secure the most yield per acre. Only through the use of good fences, permanent and temporary, can this be accomplished.

Zinc Insulated Fences

Today—take pencil and paper and plan fence lines that will secure for you the utmost value from every bit of your land—consider, among other things, the proper rotation of crops, the control of live-stock and the hogging down of corn.

Then—give equal attention to the choice of fence that will best meet your needs. Investigation will convince you that American Steel & Wire Company Zinc Insulated Fences offer the utmost in dollar for dollar value. Sturdily constructed of the finest material and covered with a heavy, uniform coat of zinc, they will give longest life and resist corrosion to the utmost.

Near you is one of our dealers. His store is Fence Headquarters and he will render every assistance in helping you select the type of fence that you need. He also carries either the Banner or Ideal U-shape Steel Posts. Also ask him about the new National Expanding Anchor Dir: Set End and Corner Posts.

WHY EVEREADY LAYERBILT "B" BATTERIES ARE KNOWN FOR LONGER LIFE

JUST a few cents extra expended for an Eveready Layerbilt "B" Battery will bring you 25% to 30% longer use than you can get out of an ordinary "B" battery constructed of individual round cells. In addition, the flat-cell construction of the Layerbilt does away with 89 weak spots—wires and soldered connections which are the seat of trouble in the old-fashioned type of "B" battery.

That is why the Eveready Layerbilt is the leader on the "B" battery market today. It is exceptionally well liked in the country, where long usefulness and dependability in batteries count. It is *all* battery. Waste space has been eliminated. You get all "honey" and no "comb."

Eveready Layerbilts are protected by patent—no one else can make them. Look for the name "Eveready" on the label. There are two sizes—the Medium Size and the Large Size. If you have been using medium-size batteries, buy the Medium Size Eveready Layerbilt—No. 485 (price \$2.95). If you have been using heavy duty batteries, buy the Large Size Eveready Layerbilt—No. 486 (price \$4.25).

NATIONAL CARBON COMPANY, INC.
General Offices: New York, N. Y.
Branches: Chicago Kansas City New York San Francisco
Unit of Union Carbide and Carbon Corporation

TUESDAY NIGHT IS EVEREADY HOUR NIGHT. East of the Rockies—9 P. M. Eastern Standard Time, through WEAF and associated N. B. C. stations. On the Pacific Coast—6 P. M. Pacific Standard Time, through N. B. C. Pacific Coast network.

Here is the exclusive Eveready Layerbilt construction. Only five solderings and two broad connecting bands, all other connections being made automatically. Waste space eliminated. Layerbilt construction is a patented Eveready feature.

Here is the inside story about every 45-volt "B" battery assembled of separate, individually sealed cells. There are 30 independent cells, connected by 29 fine wires and 60 soldered connections—69 chances for trouble. Note the amount of space wasted between cells.

EVEREADY Radio Batteries

Farm Facts and Fancies

By ALVA AGEE

THE Federal Farm Board took its ultimate step in attempted control of world wheat prices through the creation of the Grain Stabilization Corporation. Of course it has not gone beyond the provisions of the Agricultural Marketing Act, but it is a step that the Farm Board hoped never would be necessary.

When the Board was created its plan was to encourage cooperative action, and it promoted the creation of the Farmers' National Grain Corporation and advanced money so that producers could be cared for while their wheat was held off the market awaiting an advance in price. This looked good. No American farmer should be in a position compelling him to sell his crop before the time his judgment dictated as the best for him. Seven months after the creation of the Board it became evident that the price of wheat could not be bolstered by such action of cooperatives in which any loss by holding would fall back upon the farmers.

Some Predictions

Our U. S. Bureau of Agricultural Economics believed it had the data a while back justifying a prediction of higher prices. It estimated the reduction in world supplies, outside of Russia and China, at 360,000,000 bushels, and in the September issue of "Crops and Markets" it said: "Taking into account the average annual increase in demand this reduction in supply would normally raise the average in the world markets about 40 to 45 cents per bushel over the average of the past year."

In October it believed that prices would probably average 35 to 40 cents a bushel higher than in the past year. In November it cut the estimate to 25 cents, and in January it said that "the indications are still for some improvement in price."

Watching "Futures"

This is not mentioned in criticism of price prediction by the Bureau, because on the average I believe such prediction can be helpful to the man who does not understand what weight to attach to isolated facts and is concerned with products that are not dealt in for future delivery.

It is probably true that the prices of "futures" in world grain markets, registering as a rule the judgment of our keenest traders who are backing their judgment with their money, may be a more dependable guess on probabilities. Usually they are far afield at some time during the season. One powerful crowd backs one opinion, and another backs the opposite, and our surest fact is that nobody knows.

A Surplus Cannot Be Denatured

My own unimportant opinion is that Europe believed that the Soviet government of Russia would let a good deal of wheat go out for the sake of getting needed credits, making their own people eat rye, etc.. Argentina had more wheat than we counted on, and fundamentally the matter has been that the presence of a world surplus, tightly held for the time in the United States and Canada, exerted its natural influence on the sentiment that makes prices.

When a surplus is in existence buyers are influenced by the fact and hold off from purchases that are not immediately necessities. Anyway, the advancing of government money to the Grain Corporation has not kept the market from sinking, and the wheat growers' advisory committee urged the Federal Farm Board to exercise what have been regarded as emergency powers and to provide means for actual government purchase of wheat to relieve pressure on the price.

Government Wheat

The money advanced for use of cooperatives was a loan, and the presumption is that it was accepted at the farmers' risk. That has not worked out so far, and the emergency step has been taken. Any loss or gain on the wheat bought by the recently formed Grain Stabilization Corporation belongs to the government. It takes wheat off the market in the hope that the price for the remainder will advance, and all of us are now owners of wheat that is to be held at a venture, and later disposed of in some way. As its sale in the summer would affect the market to the disadvantage of the producers of winter wheat when ready for market, no sale is now in sight unless our country figured right and Europe figured wrong, and she must come into the market at a good stiff price. A man like Chairman Legge must be considerably puzzled.

Being "Uncle Sam" to Canada

The situation would not seem so bad if we were protecting our own market alone, but every bushel of wheat taken off the market by our government is that much to Canada's good. She stands to profit by our action because what we do not supply to Europe she can ship when it may seem best to her. I did not expect to see our Farm Board take this emergency step, but the provision for it is in the Marketing Act, and while trying out this matter of price control it probably was just as well to go to the limit.

On the other hand, it has focused the attention of the public press on the fact that the government has started definitely on a road that leads logically, as some other classes of producers will claim, to an effort to fix home prices, on all commodities of which we may have a surplus, by buying and holding the surplus. Disregarding the economic soundness of such a policy, on which many of us differ widely, I believe that all of us will come to see that we are in the curious position of having taken a second step before we took the obvious first step of making sure that production was under control, and especially production in this country and Canada.

A "Crystallizer"

My friend, Dr. H. P. Miller, whose selection as a Master Farmer of Ohio was so merited, will pardon the quotation of a sentence from a recent letter. He says: "I looked on the Board as a crystallizer of commodity marketing pools." That was what many of us banked on, and we can depend on it that the sound, capable men who were chosen by the President as members of the Board hoped that the pools, strengthened by loans from the government, would solve the problem, and would exert an influence on production in doing so. Temporary failure to get quick results has led to use of all the power granted in the Marketing Act.

Sunday Market

Since visiting your roadside market about a year ago we decided to start a small market. Do you remain open on Sunday? How many months do you hold open in the year?

IN response to your inquiry, I never keep my roadside market open on Sunday. Since we have taken some pains to have a succession of fresh things over as long a season as possible the market operates actively from about the middle of May to the end of November, or even later when mild weather prevails. G. S. W.

ANNOUNCING NEW FEATURES OF THE FORD TRUCK

RUGGED STRENGTH is an important feature of the improved Ford chassis. Many parts are of new design. For example, the front axle, which is a chrome-alloy forging, is nearly twice as strong as formerly. The front spring is heavier, with wider leaves. Front radius-rod is heavier, and king-pins, thrust bearings and wheel bearings are larger.

The rear construction is also improved. It has a spiral bevel gear of special Ford truck design, with straddle-mounted pinion. The housing is of exceptionally strong construction. The axle shafts are heavier than formerly, and because of the three-quarter floating design of axle construction, they serve only to turn the wheels, without carrying any of the weight of truck or load.

A feature of the improved Ford truck is the new 4-speed transmission, which provides abundant power for moving capacity loads, and ample speed where time saved is an important factor.

Brakes on the front wheels have been enlarged to the same size as those on the rear wheels, providing increased braking area and a high degree of safety.

The four-cylinder engine of the Ford truck develops 40 horsepower at moderate speed. This means that nearly its full power becomes available without the need for excessive speed. Especially important to the reliability of the engine is the simplicity of the electrical, ignition, cooling, lubrication and fuel systems.

Other chassis features, many of which are unusual in a truck of such low price, are the cantilever rear springs; the torque-tube drive; and the dual rear wheels at small additional cost, making possible the use of balloon tires the same size throughout, so that all six steel disc wheels and tires are interchangeable all around.

You can inspect the improved Ford truck, today, at the showroom of your Ford dealer.

1 4-SPEED TRANSMISSION

A wide, flexible power range

2 NEW SPIRAL BEVEL GEAR REAR AXLE

Rugged strength and long life

3 LARGER BRAKES

Providing a greater degree of safety

4 NEW FRONT AXLE AND SPRING

Front construction unusually sturdy

Is your Spade a Crutch

...after the Day's Work?

At the end of the day, which is it? Do you go home with your spade over your **SHOULDER**? Or do you use it as a **STAFF** most of the way? Which of these two men in the cartoon is **YOU**? That depends on how you have been treating yourself. Especially your **FEET**. Your feet affect your whole body.

Now look again at the cartoon. You see both men are carrying spades. Both have on clothes that look the same. Their boots, also, **LOOK** the same. But they are **NOT**. The cheerful looking man wears Goodrich Boots. His feet have been **COMFORTABLE** all day. He walks with a **SPRING** in his step. Things look bright to him. That shows on his face. But look at the **OTHER**.

What is the matter with him? Simply that he has been wearing a pair of stiff, heavy boots. You can't feel very happy if your feet ache and feel like a couple of tons of lead. You'd be all **WORN OUT**, too, if you had boots like this pulling at your feet for twelve hours like a ball and chain.

Lightening foot burdens

Well, there is no need for him to be like that. Or for you. Goodrich has found a way to **LIGHTEN** the foot burden. **YEARS OF EXPERIENCE** in the making of automobile tires. The help of the great Goodrich research labora-

Goodrich 4-buckle over-shoe. Light and tough—like Goodrich Boots.

Rubber Footwear for Every Member of the Family

By R. P. KESTER

THIS is written on George Washington's birthday. I have no way of knowing what kind of a day it was 198 years ago, but if it was anything like today it was a most auspicious day for the Father of his Country to make his appearance. The sun is shining, the birds are singing, and the dirt roads are knee-deep with mud. As long as I can remember people have made much of this date. In later years some writers have tried to lessen the esteem in which Washington is held by American people by proving that he was a human being. But he stands upon a firm pedestal, and even though scavengers cover the statue with mud, the material underneath is not harmed.

Our lawmakers are always glib in quoting Washington on every conceivable subject, pro and con. Whether the question is tariff, prohibition, European entanglements, war, peace, or what-not, Washington is quoted freely. But why is it that the subject which was dearest to him, and the business which he loved above every other—agriculture—is neglected by modern writers and speakers?

A P. S. to a letter from a New Jersey reader asks about using chicken manure on his apple and peach trees. He says that the apple trees are inclined to grow too much top, and that the peaches last year were speckly and wormy. When trees grow too fast it shows they already have an excess of nitrogen, the chief element in chicken manure. The worms and specks may be prevented by proper spraying. If the writer is not informed on how and when to spray, he should get in touch with his county agent and get full information and instruction from him. Also, send to the Experiment Station, New Brunswick, and ask for bulletins on spraying peaches for insects and diseases.

In spite of all that I have said about the capacity of tractors, still some people persist in trying to find a garden tractor strong enough to do a big tractor's work. Yet these same people have more sense than to hitch a single horse to a four-horse load and expect him to pull it. Garden tractors are made primarily to do such work as one horse would do in the way of cultivating, marking out, covering seed, drawing a small disk. Good ones will plow with an eight-inch plow in soil that is in good tilth. But no sane man would go into a ten-acre field with one horse and a small plow and expect to do a thorough job of plowing.

Some of them are used because they will make a boot comfortable and flexible. Others because they give service and wear well. But no matter what they are used for, they **WORK TOGETHER**... they **BLEND**.

In the same way balance allows boot and body to work together. Balanced boots won't wear **YOU** out. You can't wear **THEM** out. Let your feet **FEEL** the difference.

ing sponsored by Pennsylvania Farmer. It will be a grand trip and I am sure that everybody on it will come back wiser and richer—richer in things that really count. Well, our turn may come yet. Never to have been farther south than Alexandria, Va., nor farther west than Topeka, Kansas, is to admit being provincial in these days. Yet I know some people who have been around the world and never saw anything but a guide book.

Friendly Talks

By Edgar L. Vincent

"Oh my, Jasper! Don't dip to the bottom!"

"They had a big family of boys and girls, that good farmer and his wife, and it was no easy matter in those days long ago to make ends meet. Only once in a great while did Aunt Caroline indulge her big swarm of boys and girls with 'minute pudding,' with maple sugar shaved up in milk for a dressing; and when Jasper dipped to the bottom, he got the very best, sugar, cream and all, and the other boys and girls had to go on short rations. Then Aunt Caroline would burst out, 'Oh, my, Jasper! Don't dip to the bottom!'"

That was a long time ago, but wonder if folks, young and old, are not just about as apt to "dip to the bottom" now as they ever were. Maple sugar shaved up in cream is good, no mistake about that, and there is something about us all that makes us like to reach to the bottom of the bowl and bring up the best there is, and let other folks shift for themselves.

One of the hardest battles we have to fight is to be fair enough and square enough to stir the cream bowl all up well, clear from the bottom before we take a dip ourselves or pass it on to some one else. And yet, how much happier we are after we have done just a little thing like that than we are when we have scraped the sugar bowl clean and left the thin milk for other folks!

Now, I expect somebody is just ready to ask, "How can I help being selfish sometimes? It is my nature. I was born that way." And I do not know of any way to do it except to fight, tooth and nail, till the miserable disposition has been conquered.

Porcupines, you know, point out their quills in every direction when they are attacked. It is the same way with selfishness. We are pretty likely to get many a keen-pointed arrow to our hearts, minds and souls if we begin this struggle against self; but nothing else will give us the victory.

SPRING ROSE CARE

EXTRA care is needed if rose plants are to be started in the spring, but plump stock planted very early will produce good plants. Late spring planting is always attended by high mortality unless potted roses are used. This is a warning included in "Garden Roses," a new bulletin written by Alex Laurie of the department of horticulture of the Ohio State University.

"When the plants arrive they should be unpacked at once, the roots placed in water for an hour, and then planted," says the bulletin. "If it is impossible to plant them when they arrive, the roses should be heeled in a trench and covered with soil until they are planted."

No. 10

A NEW church was nearing completion on a lot just back of my home in the Old North State. Preparations were being made to apply the finishing coat of plaster. A hole about eight feet in diameter and five feet deep had been filled to the level of the ground with lime paste or cream of lime. Returning from the post office rather hurriedly one summer day, for my girl was waiting for me around the corner, I took a short cut across the church lot and walked into this pit of lime paste and sank to the base of my three-inch collar. (We wore them high in those days.) Had the hole been two feet deeper, this story would never have been told—perhaps it should have been deeper—much deeper.

I thus got a baptism in lime and became more intimately associated with it even at an early age than any one of my generation. A few years later I found myself a member of the Experiment Station staff at Pennsylvania State College in a land abounding in sour soils, and at the same time the greatest limestone producing state in the Union. The abundance of limestone in this section is illustrated from the fact that my house and a stone retaining wall 350 feet long and four feet high were made from high-grade limestone secured from the excavation. My baptism in cream of lime and later my permanent house constructed of limestone leaves no avenue of escape from more or less constant thought concerning the properties and value of lime as an important step toward permanent agriculture.

My early associations with the late William Frear, Thomas F. Hunt and also Alva Agee served further to stimulate my interest in lime and led to a study of the sour soils of the Keystone State and eventually to the establishment of a series of field plot experiments, including 279 plots designed to study the value of different forms and amounts of lime in relation to economic crop production.
